The second important point is that while both genetic evolution and cultural evolution are Darwinian processes, they are not identical. As made clear by the founders of contemporary cultural evolution research (Boyd and Richerson, 1985; Cavalli-Sforza and Feldman, 1981), the underlying mechanisms of cultural evolution may be very different from the mechanisms of genetic evolution. For example, while genetic mutation is blind with respect to fitness, cultural innovations may be guided by purposeful agents; while genetic inheritance is particulate (i.e., it involves the high-fidelity transmission of discrete units of inheritance), cultural inheritance may be of much lower fidelity and involve the blending of multiple, continuously varying traits. None of these differences invalidate a Darwinian theory of evolution; there are still mutation and inheritance, even if they are not blind or particulate – they just mean that it must be modeled and understood differently. The failure to appreciate these differences was one of the pitfalls of *memetics* (Aunger, 2000a), which did, for example, require particulate inheritance of gene-like units of inheritance (memes), and which never properly took off as a scientific discipline, perhaps because of this insistence.

Cultural Microevolution

In the 1970s and 1980s, two pairs of researchers laid the foundations for the contemporary study of cultural evolution. Cavalli-Sforza and Feldman (1981) and Boyd and Richerson (1985) constructed mathematical models of cultural evolution using techniques drawn from population genetics (*see* Cultural Evolution: Theory and Models). Their models of cultural evolution were Darwinian, in that they assumed variation in a set of cultural traits and modeled various processes that act to change this variation over time as these traits are transmitted from individual to individual. Yet they also successfully incorporated the differences between genetic evolution and cultural evolution noted above, such as incorporating blending inheritance or guided (rather than blind) variation. Because these models are concerned with the processes that transform variation *within* populations, such models can be described as concerning *cultural microevolution*.

The aim of these models is to identify the population-level signatures of different microevolutionary processes. For example, models suggest that vertically transmitted traits, which are passed from parent to offspring just like genes, will change slower than horizontally transmitted traits, which are passed between unrelated members of the same generation (Cavalli-Sforza and Feldman, 1981), a prediction supported in subsequent empirical research (Hewlett and Cavalli-Sforza, 1986). In another example, Henrich (2001) modeled the diffusion of a novel technological innovation through a society via different transmission biases. Conformist transmission, in which individuals preferentially adopt the most common trait in the population, was shown to generate S-shaped diffusion curves, whereas individual trial-and-error learning generated r-shaped curves. Given that most innovations exhibit S-shaped dynamics (*see* Evolution: Diffusion of Innovations), Henrich (2001) concluded that conformist transmission is the most plausible process responsible for the spread of novel technological innovations.

Cultural Macroevolution

In parallel to these mathematical models of cultural microevolution, another group of researchers has used analytical methods borrowed from evolutionary biology to study *cultural macroevolution*, which refers to large-scale, long-term patterns of cultural change at or above the level of the society. These methods, originally designed to reconstruct the evolutionary history of biological species (*see* Comparative Method in Evolutionary Studies), have been used to reconstruct the evolutionary history of cultural traits such as languages (*see* Evolution and Language: Phylogenetic Analyses; see also Pagel, 2009), written manuscripts (Howe et al., 2001), technological artifacts such as stone tools (*see* Evolution, Technology of; see also Lipo et al., 2006), and behavioral practices such as cattle keeping and rules of wealth inheritance (Holden and Mace, 2003).

One aim of these studies is simply to reconstruct the most likely historical scenario that gave rise to contemporary variation in a trait, in terms of which language, technology, and practice emerged earlier and what came later. However, such methods can go beyond mere historical reconstruction and address specific hypotheses concerning why particular cultural traits successfully spread. For example, Holden and Mace (2003) showed that the adoption of cattle led to the switch from matrilineal (mother-to-daughter) to patrilineal (father-to-son) wealth inheritance, rather than vice versa (inheritance rules influencing the adoption of cattle). Gray and Atkinson (2003) showed that Indo-European languages most likely hitchhiked along with early Anatolian farmers rather than being spread later by nonfarming Kurgan horsemen. A longstanding issue in these analyses is the extent to which cultural macroevolution constitutes a branching process of phylogenetic divergence, thus resembling the evolution of animal species, versus one in which traits readily transfer between lineages, thus resembling the evolution of many bacteria and plant species, in which horizontal gene transfer causes lineages to blend (*see* Cultural Evolution: Phylogeny versus Reticulation).

Methods

As noted in section Cultural Microevolution, the earliest cultural evolution research primarily involved the construction of mathematical models (Boyd and Richerson, 1985; Cavalli-Sforza and Feldman, 1981), and this is still a vibrant area of research (e.g., Boyd and Richerson, 2005; Enquist et al., 2011; Lewis and Laland, 2012; Aoki et al., 2011; Bentley et al., 2004; Mesoudi and Lycett, 2009). Increasingly, the predictions of these models are being tested empirically both in the field and in the lab. The first ethnographic field study to explicitly test the predictions of cultural evolutionary models in a small-scale society was Hewlett and Cavalli-Sforza (1986), and ethnographic methods have continued to be used primarily to determine how cultural traits are transmitted through small-scale social networks (e.g., Aunger, 2000b; Reyes-Garcia et al., 2009; Henrich and Henrich, 2010). More recently, lab experiments have been used to examine, under more controlled conditions, how and when people learn the solutions to semirealistic artificial tasks from other members of small groups (Mesoudi and O'Brien, 2008; McElreath et al., 2005; Toelch et al., 2008; Efferson et al., 2008).

The phylogenetic methods discussed in section Cultural Macroevolution were first applied to cultural datasets by Mace and Pagel (1994), and have since been applied to datasets from linguistics (Pagel, 2009), anthropology (Lipo et al., 2006; Mace et al., 2005), and archaeology (O'Brien et al., 2001; Lycett, 2009). Again, these methods have been supplemented with ethnographic studies of cultural transmission, for example to measure the extent of cross-lineage blending (Tehrani and Collard, 2009), as well as lab experiments (Spencer et al., 2004). In the latter study, artificial manuscripts were passed along a known phylogeny, and then phylogenetic methods were used to reconstruct the simulated phylogeny, in order to test the validity of those methods.

As can be seen by this brief overview, there is an encouraging interplay in the cultural evolution literature between formal models, lab experiments, ethnographic field studies, and phylogenetic reconstruction of historical data. This is the sign of a healthy science, as theoretical models generate predictions that are then tested empirically, with the results of those empirical tests fed back into the models, which generates new predictions to be tested, and so on.

Current Topics and Issues

Domain-Specific versus Content-Free Biases

One ongoing debate concerns the relative importance of domain-specific 'content biases' versus content-independent 'context biases.' The former are emphasized by cognitive anthropologists (e.g., Sperber, 1996; Atran, 2001) who argue that the spread of cultural representations can be predicted from an understanding of the biologically evolved cognitive structure of the brain. This creates 'cognitive attractors' (Sperber, 1996) that bias cultural change toward intrinsically appealing ideas. For example, it is argued that the kinds of supernatural beliefs that are most likely to spread are those that are 'minimally counterintuitive' (Norenzayan et al., 2006), meaning that they violate some of our intuitions but not excessively so, such as ghosts that violate our folk physics by passing through walls but that obey our folk psychology by exhibiting memory and a desire for revenge. In contrast, other researchers (Henrich and Boyd, 2002; Richerson and Boyd, 2005) place more emphasis on content-free transmission biases, such as conformist transmission (copy whatever is most common in your society) or prestige bias (copy whatever the most prestigious member of your society does). This latter camp argues that many cultural adaptations, from canoes to computers, are too complex and novel to have domain-specific cognitive attractors dedicated to them, and are instead the result of chance innovations spreading via content-independent transmission biases (Boyd et al., 2011a). A similar debate is occurring in linguistics between Chomskian nativists who emphasize language-specific cognitive processes and cultural evolution researchers (e.g., Kirby et al., 2007) who emphasize general properties of cultural transmission (*see* Evolution and Language: Cultural Transmission).

This difference in emphasis has led to some spirited debate (Claidiere and Sperber, 2007; Henrich et al., 2008), but the two positions are not mutually exclusive. Some traits, such as food preferences, are likely to be highly influenced by biologically evolved cognitive biases due to the direct biological relevance of their content; others, such as recent and complex technologies, are unlikely to have dedicated cognitive biases and so result from a more content-free, populational process.

The Origin of Cumulative Cultural Evolution

Many species exhibit social transmission (Galef and Laland, 2005), and several exhibit regional traditions in tool use or foraging behavior that appear to have spread culturally (Whiten et al., 1999; Lycett et al., 2007). No other species, however, appears to have the capacity for cumulative cultural evolution (CCE), whereby modifications are built up over successive generations such that a single individual could never have invented it alone (think of quantum physics or a computer tablet). An outstanding question is why only humans have CCE. Some have argued that only humans possess cultural transmission mechanisms of high enough fidelity to support CCE, such as imitation (Lewis and Laland, 2012; Tennie and Over, 2012). Other evidence suggests that our species' capacity for collaboration and cooperation is key (Dean et al., 2012; see also next section). An alternative hypothesis is that there was no cognitive change associated with the emergence of CCE, and instead it was the result of larger population sizes and densities that made the loss of complex cultural traits less likely (Powell et al., 2009). Further comparative studies with nonhuman species, and archaeological study of the origin of complex cultural traits, will shed light on this.

The Evolution of Human Cooperation

Several cultural evolution researchers have drawn a link between our species' unusual capacity for CCE (see previous section) and our similarly unusual capacity to cooperate with nonkin (*see* Human Cooperation, Evolution of; Kin Selection). Whereas other primate species direct help only to close relatives (Jensen et al., 2007), humans frequently help nonkin in situations in which they are unlikely to get any personal return or increase their genetic fitness. Boyd, Richerson, and others (Boyd and Richerson, 1985; Gintis et al., 2003; Boyd et al., 2011b) have argued that a process of cultural group selection has occurred in humans, in which selection has acted on culturally homogeneous (but not necessarily genetically homogeneous) groups to favor group-beneficial traits. This remains a contentious hypothesis given the controversy surrounding group selection within biology (West et al., 2011), and one that is receiving increasing empirical attention (Lamba and Mace, 2011; Mathew and Boyd, 2011).

Culture-Driven Genetic Change

The field of gene–culture coevolution (*see* Gene-Culture Coevolution) has explored, mostly theoretically, the extent to which cultural evolution might interact with genetic evolution (Laland et al., 2010). The conclusion of many of these models is that cultural evolution can often drive genetic evolution to new equilibria that it would not have reached in the absence of culture. For example, the cultural invention of dairy farming led to the spread in some populations of lactose tolerance alleles, due to the fitness benefits of drinking milk in adulthood (Itan et al., 2009). Similarly, sickle cell genes likely spread because they confer resistance to malaria, a disease that spread when agricultural methods created ideal conditions for mosquitoes to breed (Durham, 1991). The extent to which cultural evolution has shaped the human genome, and whether this extends beyond physiological changes in response to the agricultural revolution, are empirical questions that will be addressed as gene-sequencing technology advances.

The Neural Basis of Cultural Transmission

Genetics was revolutionized by Watson and Crick's discovery of the molecular basis of genetic inheritance. An equivalent understanding of the molecular basis of cultural evolution would concern how information is stored neurally in brains, and how that neural information is transmitted from one brain to another. Current understanding of how the brain works is not yet able to provide the answer to this question. One potentially promising line of enquiry involves mirror neurons, cells that fire both when an individual observes a specific action (e.g., a particular hand grip) and when the individual observes another individual doing that same action (Rizzolatti and Craighero, 2004), potentially providing a cellular basis for imitation (Iacoboni et al., 1999). However, how this translates into the transmission of, say, tool-making skills remains unclear (Stout, 2011). As neuroimaging technology improves, a better understanding of the neurological basis of cultural transmission will hopefully emerge.

Conclusions

Cultural evolution provides a rich set of theories and methods for studying cultural change, encompassing the subject matter of several traditional academic disciplines. It provides rigorous, scientific tools for linking individual-level cultural transmission dynamics to population-level patterns of cultural change and variation, solving the 'micro–macro' problem that has beset the social sciences in the past. Previously, I have suggested that just as evolutionary theory served to synthesize the biological sciences in the 1930s and 1940s within an overarching 'evolutionary synthesis' (Huxley, 1942), so too evolutionary theory can synthesize the social sciences (Mesoudi, 2011; Mesoudi et al., 2006). 'Macroevolutionary' disciplines, such as archaeology, comparative sociology, macroeconomics, history, and historical linguistics, would be united with 'microevolutionary' disciplines, such as ethnography, psychology, microsociology, microeconomics, and sociolinguistics, with the historical and comparative patterns identified by the former explained in terms of the individual-level mechanisms studied by the latter. The recent spread of cultural evolutionary theory to disciplines such as history (see

Turchin, 2003), economics (*see* Evolutionary Economics), and archaeology suggests that such a synthesis is, in principle, possible.

Our species' ability to adapt culturally to new environments via cultural evolution, rather than genetically via natural selection as seen in other species, is likely responsible for our rapid colonization of virtually every terrestrial environment on the planet. Many of those environments have now been transformed beyond recognition by our ongoing cultural evolution, both for the better (e.g., the eradication of diseases by medical knowledge and technology) and for the worse (e.g., atmospheric pollution from the processing of fossil fuels). An interesting possibility is whether our increasing understanding of cultural evolution might help to encourage the former and discourage the latter.

Cultural Evolution: Phylogeny versus Reticulation

Peter Bellwood, Australian National University, Canberra, ACT, Australia

© 2015 Elsevier Ltd. All rights reserved.

Abstract

Cultures, languages, and biological populations evolve in time and space through both phylogenetic processes of transgenerational inheritance and reticulate processes of interaction and borrowing (diffusion). Phylogenetic processes in the human context are set in motion by geographic expansion and especially by population migration into new territories. Long periods of nonmigratory interaction can lead eventually to the erosion of phylogenetic signals, but the circumstances under which erosion occurs can differ between material and social aspects of culture, language, and biology. In general, but restricted to the past few millennia, language families retain the most accessible traces of phylogenetic descent.

Why do human cultures and languages form patterns of similarity and differentiation through time and across space, and how do such patterns form? Why do archeological cultures and language families exist? When such patterns have been formed across large areas by processes of expansion, how long can we expect their traces to survive in archaeological and linguistic landscapes? For instance, by comparing living and ethnographic European or Polynesian cultures, languages and genetic profiles, to name two pertinent examples (from many) that are considered again in this article, can we expect to infer ancestral episodes of population migration and ethnogenesis that occurred within the ancestry of these peoples many millennia ago?

These are important questions, given that the major disciplines that investigate human prehistory are divided into two main groups. Some, like comparative linguistics and population genetics, depend on data located in the present or recent past. Others, like archaeology, philology, ancient DNA, and craniometric studies, derive their data directly from the deeper past. The former make inferences from comparison, and the latter from direct investigation of behavioral and biological residues, mostly recovered by archaeological excavation. On some occasions, inferences from these two discipline groups find accord, but sometimes they do not. Broad understanding of the deep human past therefore must be multidisciplinary and also conscious of issues connected with context and scale.

Although this article is concerned mainly with the formation of cultural and linguistic (i.e., behavioral, not genetic) patterns through time and space, the multidisciplinary perspective just proposed demands that we consider genetics and biology too, at least to some extent, because there can be little doubt that cultures and languages as we know them are related to specific populations. Such populations have, or once had, identifiable biological profiles, even if there is constant blurring of boundaries as people communicate, exchange genes and ideas, and sometimes undertake much less pleasant actions against their neighbors across their perceived cultural boundaries. This observation leads to the core concept of this article – cultures, languages, and biological populations must evolve through both descent-based and contact-based processes.

Naturally, total reliance on a biological concept, such as 'phylogeny' (evolutionary history of a genetically related group of organisms), within the anthropological, archeological, and linguistic disciplines is completely unwarranted, because it is apparent that culture is transmitted through both phylogenetic and reticulate processes. Thus, the transmission of cultural knowledge and language from generation to generation cannot be equated precisely, in terms of mechanism, with genetic inheritance alone. People mate and contribute 50% of their genes to each offspring, and offspring cannot acquire genes from any other source, except perhaps through modern transplant technology. But a husband and wife from different ethnolinguistic communities do not create a new language from 50% of the linguistic resources of each drawn at random, or build a house split down the middle to reflect their separate architectural traditions. This is partly why, if we travel in the twenty-first century in Africa, Southeast Asia, and the western Pacific, even Europe and India, we find millions of people who speak closely related languages, but who are as different in biological appearance as western Europeans and northern Indians (Indo-European speakers), Melanesians and Filipinos (Austronesian speakers), or Iraqis and Ethiopians (Afroasiatic speakers). There is nothing terribly mysterious about all of this. It means, quite simply, that we need concepts of both phylogeny and reticulation to understand the creation of historical and ethnographic situations.

The essence here, at any given time, is that the background to any specific cultural and linguistic situation can be considered in terms of inheritance, as recognized between different taxa from patterns in shared and uniquely innovated traits (phylogeny), and in terms of contact and diffusion (reticulation). These two processes always have worked hand-in-hand for all societies, except for those who have existed in utter isolation – not a common occurrence in human history, even for remote Pacific Islands. Any attempt to understand the genesis of a human society purely in terms of one and not the other process, therefore, generally would be futile. Nevertheless, clear awareness of the operating mechanisms of these two processes through time can assist prehistorians and historians to interpret the human past.

Evolution of phylogenetic patterning occurs mainly through linguistic and cultural divergence, following the initial spread of an ancestral form, whereas reticulation proceeds mainly through processes of convergence or borrowing between different entities, that may be related or unrelated in

 http://dx.doi.org/10.1016/B978-0-08-097086-8.81039-9

ancestry. Phylogenetic relationships reflect patterns of common ancestry within language families and sociocultural complexes. They are of great importance because they often can imply the operation of widespread processes of human migration, sometimes rapidly and over large distances. Reticulation alone cannot create a phylogenetic array, just as new genera and species in the animal world cannot be created from unrelated forms that are incapable of breeding together. A new genus, by definition, requires a radiation of ancestral individuals if it is to come into existence. Both language families and cultures that reveal clear signs of a shared phylogenetic descent do so because of a shared basal history of radiation that in many cases occurred millennia back in time and that might have taken centuries or millennia to reach its limits. Indeed, the long-term trends within cultural evolution appear to oscillate between fairly brief and punctuated periods of phylogenetic radiation, often involving population migration, interspersed with much longer periods of reticulate ethnogenesis between relatively stable nodes within networks of communication. As we know from recent recorded history, migration has been a constant yet unevenly distributed process within human affairs.

As an example, since AD 1600, societies have developed in the United Kingdom, North America, and Australasia, which clearly share some degree of common history (phylogeny). This is evident in the almost universal use of the English language, in the direct and well-recorded biological ancestry (via migration) of many inhabitants of these regions from a British source, in the density of surnames of British and Irish origin in telephone books, and in many aspects of material and government culture that originated in ways of doing things widely current in Britain and Ireland between approximately AD 1600 and 1850. These societies in North America and Australasia originated historically via a process of colonization and early political control emanating from the British Isles. Similar generalizations can be made about the spread of Iberian culture, language, and biology through much of Central and South America, although in the early sixteenth century this was assisted by a disease impact on Native American societies far greater than occurred in later centuries (Denevan, 1992; O'Fallon and Fehren-Schmitz, 2011).

Despite these clear indications of shared ancestry, however, it is quite obvious now that by no means all of the cultural and biological patterning found in these regions is of a circumscribed British (or Spanish, or Portuguese) origin. Indigenous peoples have contributed, as have migrants from other regions. Cross-cultural borrowings abound and occur continuously, forming a network of horizontal transmission, or reticulation. Thus, we have the two different conceptual directions of transmission discussed here for the elements of both cultural and biological patterning. Naturally, in a real-life situation, such as the modern United States, it is impossible to untangle the inherited from the borrowed in an overall sense and to present the results in the form of a statistical statement. These are simply concepts that allow us to model the formation of cultural patterns through time, essentially to understand the main trends of history (for discussion, see Durham, 1991; Mace and Pagel, 1994; Bellwood, 1996, 2001, 2005; Dixon, 1997; Mace and Holden, 2005; Richerson and Boyd, 2005; Stark et al., 2008; VanPool et al., 2008).

Phylogeny and Reticulation in Prehistoric Contexts

For prehistoric situations without the benefit of philological materials, there can be no direct linguistic evidence that reflects the deep past, apart from that derived from the application of a comparative methodology to living and recorded languages. Archaeological data survive directly from the past but are subject to varying degrees of erosion from the operation of natural processes in the ground. It might be assumed, however, that material culture combinations in the archaeological record are likely to reflect human populations who shared languages and relatively endogamous breeding networks if they were complex and internally coherent, geographically widespread, and punctuational in appearance, and if they can be shown to have undergone processes of descent-based (phylogenetic) differentiation. Such an assumption might be wrong in certain circumstances, but at least it can serve as a useful working hypothesis.

Demonstration of descent-based differentiation for archaeological categories through space and time is becoming a major focus of research in modern archaeology, just as it has been for a long time in human biology and linguistics (Steele et al., 2010). An excellent recent example of this, among many, is focused on the spread of Neolithic plant economies of Western Asian origin into Europe between 6500 and 5000 BC (Coward et al., 2008). This mathematical analysis of 250 early Neolithic crop assemblages from archaeological sites demonstrates the existence of two separate combinations of crop species moving along two separate routes, one via the Mediterranean and the other up the Danube Valley through central Europe north of the Alps. In both of these regions, such crops were manifestly not present before the Neolithic, and the overall pattern fits the well-established picture, derived from other aspects of archaeology, linguistics, and genetics of a two-pronged Neolithic migration from the Near East into Europe starting around 6500 BC. I refer to the Neolithic spread to the north of the Alps again later in this article.

It is important in this regard, however, to differentiate between spreads of people, languages, and other aspects of culture. The movements of coherent crop complexes alone through Neolithic Europe cannot tell us clearly whether the vectors of movement were migrating human populations or simply an exchange of plant resources between autonomous groups of hunter-gatherers, although ethnographic and historical records of human activity in recent millennia reveal that the latter eventuality would be most unlikely from a comparative perspective (Bellwood, in press). Even so, ethnographic and historical records do offer examples of situations in which patterns of biological, linguistic, and sociocultural variation do not correlate at all, or correlate only slightly. On the other hand, they sometimes can correlate with almost 100% precision, as in the early stages of population expansion into new territories. Whole populations already *in situ* geographically can adopt new languages and cultural forms through contact-induced change (Ross, 1997), whereas at the other extreme whole populations can colonize new territories with closely correlated physical attributes and cultural characteristics.

In terms of human prehistory, it is important to remember the significance of scale. On a small scale, the inhabitants

of a village or small river basin could, and indeed have in many historical and ethnographic examples, adopt a new language and undergo genetic change as a result of intermarriage with members of an outsider group of people, perhaps of higher status. Ethnic groups can also 'fuse' under situations of depopulation or outsider-imposed stress, as has happened frequently in the period of tribal shrinkage, which history offers us in the form of the ethnographic present (for examples, see Atkinson, 1989; Moore, 1994; Nicolaisen, 1977–1978).

On a much larger scale, however, a chain-reactive process of language and cultural shift of this kind will not explain why, for instance, related languages are spoken over vast regions of the Earth in the form of major language families, such as Indo-European, Austronesian, or Uto-Aztecan (see Figure 1 in Language Families, Archeology and History of). These language families had reached their outer geographic limits before the beginnings of written history, and no historical processes such as military conquest or mass media persuasion can hope to explain them. Alexander the Great spread the Indo-European language family only on a ephemeral basis, and over the long term, his conquests had no impact at all on its distribution. Such extensive distributions are records of major human dispersals spreading foundation languages and archeological cultures. Many such dispersals undoubtedly owed their existences to population increase and dispersal consequent on the regional beginnings of agro-pastoral food production (Bellwood, 2005, 2010, in press). But this is not true for all, because many languages, such as English and Spanish, have spread in recent historical times over vast distances through migration, especially at the level of native-speaker populations, and also can be regarded as potential foundation languages for future language families. Comparative linguistics and ethnohistory also reveal some excellent examples of large-scale hunter-gatherer dispersal, especially in the Eskimo-Aleut and Athabaskan language families in North America.

One important observation from comparative linguistics, however, is that the constant evolution of any language in terms of phonological, lexical, and grammatical borrowing and change will ensure that very deep relationships in time, for instance from the Pleistocene epoch (more than 12 000 years ago), will be extremely ephemeral and difficult to trace. Such time depths take us back into the linguistic field of macrofamilies, a field always fraught with controversy.

The Importance of Migration in Spreading Phylogenetic Arrays

Wherever phylogenetic relationships can be demonstrated to exist between the members of an array of languages or cultures (including archeological cultures), and biological populations as well, dispersal of an ancestral complex must be inferred. Whether this ancestral dispersal directly related to a movement of actual people via migration is something that must be decided on a case-by-case basis. In the case of extremely widespread phylogenetic entities, population movement to some

Figure 1 Phylogeny and reticulation in time and space perspective. (NB: A diagram such as this cannot replicate the full complexity of cultural evolution in any real-life situation. It is intended only as a schematic model.)

degree can hardly be denied. In addition, most language families clearly spread relatively quickly in overall chronological terms. From internal evidence and archeological correlations, most reached their geographic limits within 3000 years or less of the commencement of dispersal – for example, between 2000 and 3000 years from origin regions to prehistoric limits in the cases of Indo-European and Austronesian. Speed of dispersal, in this regard, relates directly to the intensity of punctuation.

The comparative linguistic record also can provide clear structural evidence for rapid dispersal, especially when the component language subgroups within a family do not share any unique linguistic innovations that allow them to be subgrouped phylogenetically above the individual subgroup level. In such situations, 'descent trees' created to show the structure within such language families will be extremely rakelike, rather than treelike with many successive branches. In such cases, claimed for instance for several of the major Austronesian language family subgroups of Southeast Asia and the Pacific (Pawley, 1999), there is a strong likelihood that the resulting pattern reflects an initial history of rapid and far-flung dispersal, followed by a formation of independent subgroups, each sharing a common ancestry in the initial dispersal but all reflecting an independent history thereafter.

Direct demonstration of rapid dispersal also can be identified in the archeological record, as for example when a particular combination of artifact style and decoration too complex to reflect functional selection alone is distributed widely in a short time. Examples include the Early Neolithic Linearbandkeramik (LBK) cultural complex, which spread through central Europe about 5400 BC (Shennan, 2009); the Chavin stylistic complex, which spread through the Peruvian Andes after 500 BC (Heggarty and Beresford-Jones, 2010); and the Lapita cultural complex with its distinctive and elaborately decorated pottery, which spread through the western Pacific about 1350–900 BC (Kirch, 1997). In contextual terms, it is apparent that these dispersals of material culture were correlated with dispersals of people and perhaps language, even though the nature of the archeological record does not allow this to be stated as more than a logical possibility rather than a demonstrated fact (we will return to the LBK from a genetic perspective in the following). A parallel with the diversification of language families from a common and relatively homogeneous source also appears in the archeological record when widespread complexes, such as those already mentioned, are followed by a breakdown of widespread homogeneity into regional diversity, with this diversity becoming more marked over time. The later phases of LBK, Chavin and Lapita, illustrate such dramatic fragmentations very clearly.

Clearly, when dealing with migration, it is important to distinguish between populations who migrated into territories devoid of prior human inhabitants and those who moved into already settled areas. In both situations, the inception of a successful trajectory of migration and colonization obviously would have required the acquisition of some form of advantage allowing demographic growth and range expansion – this would have been particularly true in situations in which large native populations already were established. In many of the examples discussed thus far, the advantage seems to have been the acquisition of systematic agriculture, but the whole story is far more complex. The initial human colonizations of empty continents like Australia (50 000 years ago) and the Americas (16 000 years ago) must have led to the dispersal of phylogenetically related languages and cultures, of which some faint traces might have survived in later prehistoric and ethnographic cultural patterns (Bellwood, 2013).

Phylogenetic Studies of Archeological and Ethnographic Cultures: Some Oceanic Examples

The ethnographic and archeological records are replete with examples of cross-cultural contact via trade, warfare, and intermarriage, indeed by 'diffusion' and gene flow in their many forms. Past humans have been just as interested in communicating with their neighbors, whether as friends or foes, as have recent ones. But evidence that ethnographic and prehistoric cultures form phylogenetic arrays indicative of dispersal is not always so obvious once one moves beyond the evidence from comparative linguistics. Normally, teasing out of the nonlinguistic aspects of the pattern requires attention to details from archaeology and biological anthropology (especially genetics), assisted by information from comparative ethnology and, where relevant, historical records and oral tradition (for examples, see Romney, 1957; Flannery and Marcus, 1983; Kirch and Green, 2001; Bellwood, 2005).

As a case study, a debate has emerged in recent years among anthropological scholars working in the islands of Polynesia. Polynesians form a population of many island societies in the great triangle bounded by Hawaii, Easter Island, and New Zealand, including Tonga and Samoa, with a few additional 'Polynesian Outliers' existing to the west among the larger islands of Melanesia. That Polynesian languages share a relatively recent common ancestry is not in doubt, but beyond language, the explanations for the Polynesian cultural pattern are more contested. Two recent perspectives on the Polynesians – the 'phylogenetic' and the 'reticulate' – can be counterbalanced.

The archaeologists Patrick Kirch and Roger Green (1987, 2001) have presented Polynesia as a 'phylogenetic unit' of closely related cultures, languages, and peoples all sharing a common origin derived from the settlement of the Tongan, Samoan, and other nearby Western Polynesian islands by Lapita populations at about 1000–800 BC. Working from the archeological and linguistic records, Kirch and Green suggested that the Polynesian societies of ethnographic times formed a closely related set in terms of material culture, social organization, biological phenotype, and most important, language. Societies so related can be conceived as something akin to the genus of biologists – a group of 'species' defined as a group through possession of certain uniquely shared features (synapomorphies in biological terminology). From this perspective, Polynesian societies all share a single origin, and since that period of origin, they have differentiated because of a wide range of historical processes reflecting both internal change and external contacts with other societies both inside and outside Polynesia. Because Polynesian societies are geographically so clearly bounded by sea, and because archaeology and linguistics lead us to believe that only Polynesians ever inhabited Polynesia before European contact,

the region lends itself ideally to such a phylogenetically oriented historical perspective.

But not all agree entirely with a phylogenetic perspective. The archaeologist John Terrell and his colleagues (Terrell et al., 1997; Terrell and Welsch, 1997; Terrell, 2012) have taken an opposed and rather more reticulated viewpoint, pointing out that most ancient Pacific Island (including Polynesian) societies were never isolated and always would have maintained some degree of contact between different regions. Virtually all archaeologists would agree with this statement in simple form, because the archeological, linguistic, and genetic records carry widespread evidence of trade, borrowing, intermarriage, and so forth between different island populations. But the reticulate perspective is taken further by Terrell and his colleagues to draw the conclusion that interaction will erase any recognizable traces of cultural phylogeny (for a similar statement, also see Moore, 1994). For these scholars, the phylogenetic ancestry of cultures is generally unknowable and thus cannot contribute to an understanding of cultural history.

The perspective offered in this article agrees that a masking of phylogenetic history can occur in cases in which actual mixing between cultural entities of entirely different origin and ancestry has taken place, especially over a long period of time. Such intricate mixing on the level of material culture is believed to have occurred, for instance, during the past 3000 years in some of the Austronesian and Papuan-speaking societies of lowland New Guinea (Welsch et al., 1992; but see also Roberts et al., 1995 for a contrary view). But when 'like meets like,' as generally would have been the case in Polynesia, where all cultures shared a recent common origin, then erasure of all traces of phylogenetic relationship becomes much harder to imagine. Even in the case of lowland New Guinea, the fact that the Austronesian and Papuan languages have not in themselves generally become creolized tells us something about the strength of cultural, especially linguistic, transmission through time, and from generation to generation.

Both the phylogenetic and the reticulate viewpoints therefore are correct to a degree, and disagreement occurs only when they are placed artificially in opposition to each other. Polynesia, and especially the vast region of eastern Polynesia, has a very short time-depth, a relatively high degree of island isolation, and hence superb conditions for the survival of a record of phylogenetic spread and diversification, visible to archaeologists, linguists, and biologists alike (e.g., Buck and Vidarsdottir, 2012 for craniofacial evolution). New Guinea, on the other hand, has a great time depth for human settlement (ca. 50 000 years or more) and a relatively long period of interaction between phylogenetically unrelated Papuan and Austronesian cultures (ca. 3000 years). In many regards, however, New Guinea can perhaps be regarded as more typical than Polynesia for understanding long-term history in continental areas, as we can see from a new and significant genetic contribution to the prehistory of Europe.

A Perspective from the Holocene Prehistory of Central Europe

In the past decade, an important debate, summarized concisely by Ron Pinhasi et al. (2012), has developed within human genetics concerning the biological phylogeny of central European populations. Many regions north of the Alps, from France across to almost the Black Sea, were settled decisively by Neolithic colonists between about 5400 and 5000 BC, carriers of the LBK cultural complex of archaeologists, characterized by large longhouse villages established in regions of fertile loess soil. In archaeological terms, this complex replaced the preceding Mesolithic hunter-gatherer cultures quite sharply, and some also have raised the possibility that this was the period of initial dispersal of ancestral Indo-European languages into Europe (Renfrew, 1987). Genetics, however, steals the show at the moment, especially as a result of recent advances in the extraction of ancient DNA from human bones in prehistoric cemeteries.

Samples of ancient DNA from both Mesolithic and Neolithic skeletons in several regions of Europe, especially the LBK region, reveal that the Mesolithic populations generally were replaced by new farming peoples who came from regions to the east, possibly the eastern Mediterranean or Anatolia. In the case of the LBK, they probably traveled via the Carpathian Basin of what is today Hungary, this being the region of LBK genesis in an archaeological sense. Neolithic replacement of earlier hunter-gatherer populations, in the LBK context, therefore was fairly marked, although some archaeologists have argued for limited continuity in the record of flaked lithic tools. After all, not even the recent colonizations by Europeans of former hunter-gatherer territories in North America and Australia have caused all native peoples to disappear, and we hardly can expect a worse fate for those at interface points deep in prehistory. Many hunter-gatherers must have survived the arrival of farmers in their territories, and many (especially females) probably joined the farming populations and contributed their genes to the mix.

The most interesting observation from the new genetic research, however, concerns the question 'who are the present inhabitants of central Europe?' Surprisingly, they do not appear to descend directly, with little admixture, from either Mesolithic or Neolithic ancestors. We find instead, as discussed by Pinhasi and his colleagues, that their modern genetic characteristics are just as likely to reflect post-Neolithic demographic processes, including the effects of subsequent migrations, natural selection, genetic drift, and so forth, with none actually yet documented genetically in any precise way. There is a lesson here for geneticists in particular, this being that reconstruction of population origins and prehistory at a time depth approaching 7500 years ago cannot be done entirely by comparing the genomes of modern living people. There is no doubting the importance of the Neolithic colonization of Europe north of the Alps, and the cultural developments that occurred there most certainly did not originate entirely in the local Mesolithic. But this does not mean that all Europeans who have occupied that region thereafter, to the present, trace their ancestry only to Neolithic settlers. Migration has been of constant importance in human affairs, and cumulative genetic changes through time indeed might have masked deep levels of phylogenetic descent, as might long-term cumulative changes in culture and language. As noted for Polynesia versus New Guinea, however, the intensity of much of this masking probably will reflect the time depth involved. After all, the 7500 years that take us back to the beginning of the LBK beat the date for the construction of the Egyptian pyramids at Giza by 3000 years. That is a very long period of time.

Conversely, most of the major Polynesian migrations beyond Tonga and Samoa occurred only within the past 1000 years.

What is significant from the new European data on the LBK, however, is that linguistics, archaeology, and genetics throw different pools of light on the deep past, and those pools do not always overlap with 100% precision. Archaeologically, no one could claim that modern European cultures retain artifacts that descend directly, in phylogenetic isolation, from LBK forebears – archaeological phylogeny from 5400 BC to the present effectively has been severed completely. So has that contained within the DNA of modern populations. Skeletally, there might be more continuity, but no systematic study comparing LBK skeletons with those of modern Europeans has been done. The linguistic data, however, if interpreted to indicate an initial spread of ancestral Indo-European languages from Anatolia through Europe commencing around 6500 BC (Bouckaert et al., 2012), reveal phylogenetic relationships very clearly at the whole family level, even if historical expansions of languages, such as Latin, Spanish, English, and Russian, have erased much earlier patterning. The converse is that comparative linguistics cannot easily take us back into the Pleistocene, whereas archaeology and studies of ancient DNA increasingly are doing so.

These observations about Neolithic Europe and Polynesia are reflective of the widespread modern interest in the prospects of combining linguistic, archeological, and genetic perspectives on the human past. A main supporter of a dialogue between these disciplines of prehistoric reconstruction has been the archeologist Colin Renfrew in his writings on Indo-European language prehistory (Renfrew, 1987) and broader relationships (Renfrew, 2002). Renfrew's position, like that of Kirch and Green for Polynesia, and my own (Bellwood, 2011; Bellwood et al., 2011) for Island Southeast Asia and Oceania, and for world populations in general (Bellwood, 2005, in press), is that the prehistories of large-scale ethnolinguistic populations must be approached from the independent, but overlapping, perspectives of genetics, archaeology, and linguistics, and not just from the isolated perspectives of single disciplines.

An attempt is made finally to encapsulate some of the cultural trajectories discussed above in the form of Figure 1. This diagram highlights both divergent and convergent evolutionary situations, which should be regarded as overlapping possibilities rather than as absolutely separate processes. Divergent situations reflect the break-up of communication networks and especially the foundation by dispersal of new phylogenetic units (e.g., the dispersal of the foundation dialect chain for a major language family). Situations of convergence or amalgamation include the periodic cultural reconvergence of recently diverged traditions that already are related phylogenetically, the absorption of dispersing cultural entities by indigenous populations, the converse assimilation of indigenous traditions by exogenous ones, and balanced two-way interaction (the middle road between absorption and assimilation). Also to be taken into account is the possibility of autonomous cultural extinction, perhaps as a result of environmental problems, whether naturally or humanly stimulated.

Four other processes are shown schematically in Figure 1. These are generation-to-generation transmission of cultural traditions through time, a schematic horizontal representation of interaction (reticulation), potential for population growth (rapid during episodes of population dispersal), and chronology. The aim of the diagram is, in part, to indicate that human prehistory cannot be purely regarded as a process of local evolution through all time, but rather that major episodes of dispersal of the foundation cultures for future phylogenetic arrays punctuate the mesh of gradual reticulate ethnogenesis. Without such dispersals there could be no major language families, and none of the rapid and large-scale spreads of prehistoric agricultural economies and cultural complexes that we read from the archeological record in many parts of the world.

Abstract

We define culture as those aspects of thought, speech, behavior, and artifacts that can be learned and transmitted socially. Although the cognitive processes that allow cultural transmission may involve the action of genes, transmission of certain types of information may also be purely cultural and may therefore result in evolutionary dynamics different from those of genetic evolution. Cavalli-Sforza and Feldman and Boyd and Richerson developed a quantitative theory for the cultural transmission and evolution of traits within populations. They sought principles that could explain observed levels of variation or estimated rates of change in cultural traits in a manner analogous to, but different from, those that have proven useful in evolutionary biology.

Most models of social learning and cultural evolution have used deterministic approaches. These include models analogous to those of formal population genetics, nonspatial evolutionary game theory, reaction–diffusion systems that assume infinite populations, phylogenetic and cladistic methods, interacting particle systems, network-based models, and cultural demographic models. This article reviews deterministic approaches to cultural evolution and agent-based simulations of social learning strategies. The latter have become increasingly popular and useful as computers became faster and cheaper.

Introduction

More than 150 definitions of 'culture' have been proposed in the literature of anthropology, archeology, sociology, and other disciplines. In the following account, the article takes 'culture' to mean those aspects of thought, speech, behavior, and artifacts that can be learned and transmitted socially. This process of transmission may involve the action of genes through genetic predispositions toward learning certain types of information, for example, but may also be purely cultural and may therefore result in evolutionary dynamics that are different from those of models that allow only genetic transmission. Cultural transmission may involve any or all of imprinting, conditioning, local enhancement, stimulus enhancement, emulation, imitation, or active teaching. Cavalli-Sforza and Feldman (1973a, 1981) and Boyd and Richerson (1985) developed a quantitative theory for the cultural transmission and evolution of traits within populations. Such traits may take either discrete or continuous values. The idea here was to seek principles that could explain observed levels of variation or estimated rates of change in a manner analogous to (but, of course, different from) those that have proven useful in evolutionary biology.

There are differences between the transmission of cultural traits and genes and therefore, between the dynamics expected in cultural and biological evolution. For example, cultural evolution, which in humans (at least) entails that learned traits may be transmitted, allows for a kind of Lamarckian inheritance (Maynard Smith, 1986; Mesoudi, 2011). Genetic models can be expanded so that the members of a population are represented simultaneously by their genotypes and their phenotypes (i.e., their phenogenotypes). Their genotypes are subject to the normal Mendelian rules of transmission but their phenotypes may be learned vertically, from parents or from peers or other older members of the population. The use of methods to describe the transmission and evolution of culture analogous to those used in population genetics was initially met with some resistance. The main reasons were (1) it is difficult to characterize the exact nature of a unit of cultural transmission that could be directly analogous to the gene in genetic evolution, (2) cultural transmission was not considered accurate enough to allow transmission of intact traits (Sperber, 1996; Atran, 2001), and (3) culture was often regarded as a set of ideational properties that could not be subdivided into transmissible components, but could only be valid as a gestalt concept.

Durham (1991) argued that the use of 'cultural traits' as the units of cultural transmission 'pits nature against nurture'; using 'traits' as units sidesteps how the trait is determined. However, by specifying the model of transmission, which may be purely cultural, purely genetic, or some combination of these (Feldman and Cavalli-Sforza, 1976, 1979), and which can in principle be empirically estimated, evolutionary analysis becomes possible. In principle, Durham's alternative 'ideational units' are amenable to the same kind of quantitative analysis as that originated by Cavalli-Sforza and Feldman. In 1976, Dawkins suggested the term 'memes,' which he defined as replicators that could be retained, inherited, and mutated by means that were directly analogous to genetic inheritance. Memes were self-propagating and selected on features like 'stickiness' (propensity to remain in the mind) and 'catchiness' (the propensity to be passed from one mind to another). In this characterization, the human mind was a meme-machine shaped by memes to allow their own propagation and evolution (Dawkins, 1976). This characterization of culturally transmitted entities has led some authors to endow memes with an almost independent existence (Blackmore, 1999).

Henrich and Boyd (2002) attempted to answer critics of cultural evolution using a series of models showing that a discrete 'substrate' and error-free transmission were not in fact necessary for Darwinian cultural evolution to occur. Their

model showed that features unique to cultural transmission such as conformity and prestige bias could compensate for high error rates in transmission and allow the propagation of favorable traits, even in the absence of high-fidelity copying. In another model, assuming continuous rather than discrete representations of cultural traits, Henrich and Boyd (2002) showed that a continuous-trait model with strong 'attractors' (individual cognitive transformation of cultural traits) and weak selection reduced to a discrete-trait model with weak selection. These authors succeeded in showing that, at least with respect to the problems of particulate evolution and copy error, it was reasonable to use appropriately modified genetic models to reconstruct human cultural evolution, by analogy to the way geneticists had done for biological evolution.

Approaches to Cultural Evolutionary Theory

To date, most models of social learning and cultural evolution have used deterministic approaches. These include models analogous to those of formal population genetics (Boyd and Richerson, 1985; Cavalli-Sforza and Feldman, 1981), nonspatial evolutionary game theory (Maynard Smith, 1982), reaction–diffusion systems that assume infinite populations (Cavalli-Sforza and Feldman, 1981; Kandler and Steele, 2009), phylogenetic and cladistic methods (e.g., O'Brien et al., 2001; Mace and Holden, 2005), interacting particle systems (Hauert, 2001; Nowak and May, 1992), network-based models (Watts, 1999; Franz and Nunn, 2009), and cultural demographic models (Fogarty et al., 2013; Fogarty and Feldman, 2011; Powell et al., 2009; Li et al., 2000). Here we focus on deterministic approaches to cultural evolution and agent-based simulations of social learning strategies. The latter have become increasingly popular and useful as computers became faster and cheaper.

Types of Cultural Transmission and Their Consequences

Cavalli-Sforza and Feldman (1981) identified three types of cultural transmission analogous to vertical, horizontal, and oblique disease transmission in epidemiological models. These occur between parents and offspring, peers, and older and younger individuals, respectively. In order to model these processes, we consider individuals in a large population at time t, where t is on a scale of generations, and generation t represents the parents of generation $t+1$. It is common to assume that these generations are nonoverlapping with generation t physically replaced by generation $t+1$. Of course, for culturally transmitted traits, this does not preclude a contribution of generation t to generation $t+2$, for example.

Vertical Transmission

If an offspring's probability of acquiring trait l depends on the traits j and k of its parents, we may represent the set of such transmission probabilities or rates as $\Gamma = \{\beta_{jk,l}\}$. Given the frequencies of each representation of the trait in the parental generation at time t, $\{x_{i,t}\}$ Γ determines $\{x_{i,t+1}\}$. Mating between a pair of parents may occur at random, or we may assume, as is likely for many culturally transmitted traits, that individuals of the same trait value prefer to mate with one another. This is called 'assortative' mating and occurs with probability m, say. An example of a dichotomous trait with forms 0 and 1 (such that $i = 0$ or $i = 1$) is given in Table 1.

Then, if we write x_i' for the frequencies in the offspring, that is, generation $t+1$, we have

$$x_0' = x_0^2 B + x_0 C + b_{11,0} + mBx_0(1 - x_0) \qquad [1]$$

where $B = b_{00,0} - b_{10,0} - b_{01,0} + b_{11,0}$; $C = b_{10,0} + b_{01,0} - 2b_{11,0}$.

Iteration of eqn [1] produces the complete evolutionary trajectory for the population frequencies of this trait. Note that $b_{00,0} = 1$, $b_{01,0} = b_{10,0} = \frac{1}{2}$, $b_{11,0} = 0$ would be the expected transmission rule if 0 and 1 were alleles at a genetic locus in a sexual haploid biological organism. The closer the bs are to these values, the more the dynamics resemble those of purely genetic evolution. But the system shows interesting flexibility; for example, if the probability that an offspring is unlike its parents is high enough, a cyclic trajectory results (Feldman and Cavalli-Sforza, 1976).

Within the framework of vertical cultural transmission, the parameters $\{\beta_{ij,k}\}$ may be disaggregated into separate additive contributions from each parent, although other partitions are conceivable. Estimation of these transmission parameters, for example, under an assumption of equilibrium, is possible from familial correlations such as father–offspring or sib–sib correlations, while m is usually measured as the correlation between mates. However, this may be biased by mating convergence, namely, parents becoming more alike over the time they are together.

Empirical studies designed to assess the importance of vertical transmission of everyday preferences among Stanford University students revealed that only religious and political attitudes were strongly vertically transmitted. Correlations among the designated parents of these students were reasonably high, suggesting a moderate value for m (Cavalli-Sforza et al., 1982). Among the Aka, an African group of hunter-gatherers, vertical transmission of many customs was estimated by Hewlett and Cavalli-Sforza (1986) to be strong. More recent studies suggest that the relative importance of vertical and horizontal learning is age dependent (Hewlett et al., 2011). Generalizations of the transmission system in

Table 1 Cultural transmission with assortment

Mating			Offspring probability[b]	
Mother	*Father*	*Frequency*[a]	*0*	*1*
0	0	$x_0^2 + mx_0x_1$	$b_{00,0}$	$b_{00,1}$
1	0	$x_0x_1(1-m)$	$b_{10,0}$	$b_{10,1}$
0	1	$x_0x_1(1-m)$	$b_{01,0}$	$b_{01,1}$
1	1	$x_1^2 + mx_0x_1$	$b_{11,0}$	$b_{11,1}$

[a]The subscript t for the parental generation is suppressed, $x_0 + x_1 = 1$.
[b]$b_{ij,0} + b_{ij,1} = 1, (i, j \in \{0, 1\})$
After Cavalli-Sforza, L.L., Feldman, M.W., 1981. Cultural Transmission and Evolution: A Quantitative Approach. Princeton University Press, Princeton, NJ.

Table 1 to allow for more than two cultural variants were developed by Feldman and Zhivotovsky (1992).

Evolution under long-continued vertical transmission should be conservative relative to that expected under other modes of transmission in the sense that change over generations is restricted by parent–offspring concordance. In particular, the more closely $\{\beta_{ij,k}\}$ resembles a genetic transmission system, the slower will be the evolution. In fact, an exactly genetic transmission structure, in the absence of other forces, results in no temporal change of allele frequencies. These points will be revisited in connection with continuous traits (Guglielmino et al., 1995).

Horizontal and Oblique Transmission

Suppose that after vertical transmission, the frequency of trait variant i in the population at time $t+1$ is $x^V_{i,t+1}$ and suppose that this particular variant, once acquired, cannot be lost. Then, by analogy with epidemic models of disease transmission, we suppose that individuals of type j (different from i) who did not acquire i by vertical transmission contact those who did and are converted to i at rate f_{ji}, the rate of horizontal transmission. It is usual to assume $0 < f_{ji} < 1$. Then, after this transmission, the new frequency of i $x^H_{i,\,t+1}$ can be written as

$$x^H_{i,t+1} = x^V_{i,t+1} + \sum_{j \neq i} x^V_{i,t+1}\left(1 - x^V_{i,t+1}\right) f_{ji} \qquad [2]$$

If the trait has only two variants 0 and 1, for example, then

$$x^H_{0,t+1} = x^V_{0,t+1} + f_{10} x^V_{0,t+1}\left(1 - x^V_{0,t+1}\right) \qquad [2a]$$

which makes the logistic nature of the dynamic obvious (Cavalli-Sforza and Feldman, 1981).

Within the population, horizontal transmission will generally result in more rapid evolution (Cavalli-Sforza and Feldman, 1981; Guglielmino et al., 1995), that is, faster change in the frequencies of trait variants, than under vertical transmission. Horizontal transmission modeled by eqns [2] and [2a] occurs between members of the same demographic cohort. If the transmitters are in generation t (or earlier) and are not the parents of the acquirers of the trait, then we have oblique transmission. In most cases, oblique transmission will have similar dynamic consequences to horizontal transmission, with a slight delay. The consequences of important special cases of oblique transmission for the rate of cultural evolution were investigated by Aoki et al. (2011) and Lehmann et al. (2011). They compared 'one-to-many' or teacher transmission, where one role model is chosen and spreads its trait to the rest of the population; 'many-to-one' transmission where multiple role models may be chosen by one offspring; 'conformist' transmission where learners disproportionately adopt the majority trait; and 'best-of-k' transmission where an offspring will sample k role models from the total population and choose among them. These special cases were shown to differ in both the rate of cultural evolution and the amount of cultural accumulation that results, with the pronovelty 'best-of-k' transmission producing rapid dynamics and the conservative conformist transmission producing slow dynamics.

An important case of horizontal transmission is often called 'cultural diffusion.' The term generally applies to the trajectory of a new cultural variant, that differs from the most frequent one in the population. It can apply to the spread of the new variant within a single population or, if the population consists of several subpopulations between which there is some communication, it can refer to the spread across the collection of subpopulations. A logistic dynamic is often observed for the change in frequency of the new variant as it diffuses (e.g., Rogers, 1995). An important question for many anthropologists is whether this diffusion may occur without migration of the people who carry the trait, and it is this case for which the term cultural diffusion is often reserved. On the other hand, if people move and carry their variant of the trait with them, then this cultural variant diffuses with its carriers, a process described as 'demic diffusion.' Distinction between these is usually difficult to make, but if genetic data are available that suggest a cline or gradient in allele frequencies from a putative source population of the human migrants (Cavalli-Sforza et al., 1993), then it might be reasonable to infer that demic diffusion has occurred. Genetic testing of populations before and after an event such as the advent of dairy farming can also help to distinguish the processes of demic and cultural diffusion. For example, Burger et al. (2007) tested one Mesolithic and eight Neolithic humans and found that prior to, and just following, the innovation of dairy farming practices, the lactase persistence allele was not at high frequency. This suggests that the cultural practice was transmitted to individuals who did not have the lactase persistence allele. This population responded to selection pressures increasing the frequency of the lactase persistence gene over time.

The empirical basis of the conversion parameters $\{f_{ji}\}$ in eqn [2] has been the subject of extensive sociological analysis. Rogers (1995) introduces the notion of awareness-knowledge, which is information that the new variant of the trait exists. Awareness may be followed by an adoption phase, in which the decision to adopt may depend critically on local history of the variant, on the education level or economic status of earlier adopters *vis-á-vis* the decision maker. Late adoption may also be affected by the perceived success of earlier adopters. Clearly, for the dynamics to be interpretable, simplification of the large number of parameters involved in these details is necessary. It is possible to model reinforcement through repeated transmission in both vertical and horizontal cases simply by iterating recursions eqn [1] or [2] a number of times within a generation and taking a census after this number of repeated operations. The rate of change across the new census points will be faster than possible from a single iteration per generation.

Group Effects and Conformity

The pressure on individuals within a population to adopt a belief or perform a task in a certain way may be affected by how many others in that population believe or act in that way. The result is that the rate of transmission of a trait, instead of being constant as in eqns [1] and [2], becomes a function of that trait's frequency (or possibly frequencies). That is, for the dichotomous trait with horizontal transmission, f_{10} in eqn [2a] might be an increasing function of $x^V_{0,t+1}$ when $x^V_{0,t+1}$ is large enough. This would amount to a pressure to conform to the

majority. Boyd and Richerson (1985: Chapter 7) point out that this can accelerate the rate at which a trait spreads once it reaches a threshold frequency. If the frequency-dependent transmission operates in different directions in different places, because of chance effects or environmental differences, this kind of conformity may also augment geographical differences between isolated groups. Applications of such conformity to economic theory in terms of norms and preferences that might be culturally transmitted entities have been initiated by Bowles (1998).

Innovation

In biological evolution, the ultimate source of all variation is mutation, nondirected random changes in the DNA that may or, more often, may not result in functional change in the organism. The equivalent for a cultural trait is the appearance of a new cultural variant, an innovation. The fate of a cultural innovation within a population depends on its rules of transmission, which in turn may depend on a host of structural features of the trait itself, such as the interaction of the innovation with other traits or their rules of transmission. In addition, the general environment in which the innovation occurs may decide its fate; for example, stylistic variation in tool manufacture or behaviors that are coerced economically or by direct force would fall into this category. Finally, chance factors that result from the population size may determine whether and how fast an innovation succeeds.

In terms of the transmission law of **Table 1**, if $b_{00,1} > 0$ or $b_{11,0} > 0$ innovation has occurred in the offspring of the first or fourth matings, respectively. On a more general scale, an analogue to the infinite sites models of population genetic theory (Ewens, 1979: Chapter 3) is more appropriate to describe the stochastic dynamics of innovations, an idea that is explored in detail by Aoki et al. (2011).

Continuous Traits and Linear Gaussian Models

If the trait under study varies continuously, then the transmission scheme is more difficult to represent. It is usual to represent the values of an offspring's trait as X_{t+1} and to specify it as a weighted average of two randomly chosen parental values augmented by a random term:

$$X_{t+1} = b_m X_{m,t} + b_p X_{p,t} + \varepsilon \qquad [3]$$

where b_m and b_p are maternal and paternal weights, and ε is an error random variable with zero mean and variance σ^2. The recursion given by eqn [3] corresponds to vertical transmission, and it is easy to include correlation between the parents (i.e., assortative mating) as well as a kind of oblique transmission. The latter may be represented as a group effect g:

$$X_{t+1} = (1-g)\left[b_m X_{m,t} + b_p X_{p,t}\right] + g\overline{X}_t + \varepsilon \qquad [4]$$

where $\overline{X}_t$ is the mean of the trait at generation t (Cavalli-Sforza and Feldman, 1973b).

Several features of the dynamics resulting from models described by eqns [3] and [4] are worth noting. The existence of a group effect constrains the variance within the population (Cavalli-Sforza and Feldman, 1973b). If a number of groups are considered, however, within each of which transmission occurs as in eqn [4], then the variance, V_t, of the average across groups relative to the original group mean increases linearly with time: $V_t = kt\sigma^2$, where k depends on g, b_m, and b_f.

Linear models analogous to eqn [3] or [4] allow correlations between relatives to be computed rather simply, especially under Gaussian assumptions for the trait distribution. Indeed, the most widely used framework for studying familial aggregation of quantitative characters represents the genetic contribution to the character as a linear factor complementary to a linear environmental factor. With appropriate assumptions on the genetic term, variances and covariances between relatives can be computed that mimic those calculated under the simplest genetic hypotheses (Fisher, 1918). Controversy remains, however, about which joint linear model of genetically transmitted, culturally transmitted, and nontransmitted contributions to traits that aggregate within families is appropriate (Feldman and Otto, 1997), while few attempts to use nonlinear representations have been made.

Natural and Cultural Selection

Most intuition about the effects of natural selection on genotypes comes from an interpretation of fitness as a relative probability of survival from fertilized egg to adult. However, a considerable body of experimental evidence (reviewed by Lewontin, 1974: Chapter 5) suggests that differential fertility, sexual selection, and frequency-dependent effects are more important than differential survival although the former are more difficult to measure experimentally and to analyze theoretically. Despite these difficulties, it is reasonable to view natural selection on biological variation in terms of differential reproduction and survival. More details on the components of selection may be found in Hartl and Clark (1997: Chapter 6).

For cultural variants, natural selection on a trait may be understood in the same Darwinian way. To the extent that the variants of a trait affect the reproduction or survival of their carriers differentially, the frequencies of the variants will change over time accordingly. By contrast, cultural selection refers to differences in the rates of transmission of the cultural variants. As examples, such differences may be manifest in the rates at which individuals become aware of the alternatives or in the decision processes leading to the adoption of one or other of the alternatives. The results of cultural selection will be changes in the frequencies of the cultural variants in a population over time. One obvious difference from natural selection is that cultural selection may act within a generation, rather like an epidemic (Rogers, 1995). The parameters that summarize the process of cultural selection are the vertical, horizontal, or oblique transmission rates described above.

One area of theoretical debate concerns the possibility of conflicts between cultural and natural selection acting on the same variant of a trait. Thus, for the human cultural trait of fertility, the variant whose carriers adopt fertility control (e.g., via contraception) is at a clear disadvantage in natural selection but has spread, especially in developed countries, by virtue of its advantage in cultural selection. Other examples are

discussed by Cavalli-Sforza and Feldman (1981), Boyd and Richerson (1985), and Durham (1991). The debate, which cannot be settled with standard experimentation, centers on whether natural and cultural selection act in the same direction most of the time. Alternatively, did the process of natural selection during human evolution shape cultural transmission in such a way that those variants favored by cultural selection are most likely to be adaptive in the Darwinian sense?

A second contentious topic in debates about selection on a cultural trait concerns the role of group selection in the maintenance of variants, which, within a group, are individually disadvantageous. Two kinds of models have been considered; in one, there is extinction and recolonization of groups according to a stochastic process. If the probability of extinction of a group decreases with increasing frequency of the individually disadvantageous trait, then competition between the groups may preserve the disadvantageous trait. The usual example used for such analyses is altruism (e.g., Boyd and Richerson, 1985: Chapter 7; Uyenoyama, 1979). Maintenance of such a trait by extinction-type group selection is much less likely than by graded group selection, in which extinction does not occur but the expected relative contribution of one deme to the whole set of demes increases with the frequency of the altruist in the former (Uyenoyama, 1979). In the latter formulation, after reproduction, there is redistribution of individuals to subgroups according to a stochastic process whose outcomes depend on the numbers of the individually disadvantageous types (Cohen and Eshel, 1976). In other models, fluctuating environments in each of the subpopulations have been shown to allow group selection to occur under more general mixing conditions (Uyenoyama, 1979). As pointed out by a number of authors, there are great similarities between these theories of group selection, and the shifting balance theory of genetic evolution due to Sewall Wright (1931, 1935, 1948). There is a recent trend toward accepting the efficacy of an appropriately formulated model of graded group selection in maintaining traits that are individually disadvantageous, whether culturally or genetically transmitted. In particular, frequency-dependent cultural transmission, for example, of the conformist type, may amplify differences between groups, thereby increasing the strength of group selection relative to that of natural selection within groups (Boyd and Richerson, 1985; Henrich, 2004).

Some Metatheoretical Considerations

Four main theoretical frameworks have formed the basis for the study of behavioral evolution and, in particular, human behavioral evolution. The first is kin selection theory, the second is evolutionary game theory, the third is gene–culture coevolutionary theory, and the fourth is cultural niche construction.

Kin selection theory, due to W.D. Hamilton (1964), is based on the idea that genetic alleles whose effect is disadvantageous to their carriers may be preserved if a carrier acts to increase the survival rate of others in the population. Other carriers will most likely be relatives of the first carrier, hence the name 'kin selection.' This can result in the spread of the disadvantageous allele if the genetic relationship between the donor and the recipient of the altruism is close enough. By the mid-1970s, this theory had been extended beyond its original insect and animal boundaries to include human behaviors. In this process, the position that a wide array of behaviors would generally be genetically determined and adaptive came to be called sociobiology (Wilson, 1975). The idea that behaviors such as altruism, or preferences for mates, or certain norms or values, have a biological basis, extended sociobiology and became known as evolutionary psychology (Tooby and Cosmides, 1990).

At about the same time as the theory of kin selection originated, the application of game theory, the second framework, to animal and human behaviors also became widespread. Here, in pairwise interactions, for example, each individual was thought to optimize its behavior relative to the alternatives the other could adopt. The notion of optimization became prevalent in discussions of behavioral evolution (see, e.g., Parker and Maynard Smith, 1990). Such treatments did not consider evolutionary dynamics as processes of frequency change but as processes of maximization of functions chosen by the investigator, usually to represent a measure of fitness.

Although traits such as altruism may well have a culturally transmitted basis, they have generally been studied in the theoretical literature using genetic models. Gene–culture coevolutionary theory was introduced as an alternative to the two former frameworks by Feldman and Cavalli-Sforza (1976; see also Feldman et al., 1985). By allowing each individual a phenogenotype, the investigator is free to incorporate transmission mechanisms, selection functions, and dynamics that span the spectrum from purely genetic to purely cultural. Besides the obvious gain in flexibility to describe the evolution of behaviors, this framework also permits a natural statistical analysis of correlations between relatives *á la* Fisher (1918). The advantage here is that nongenetic effects are modeled more realistically than is possible using standard linear regression theory (Feldman et al., 2013). In the coevolutionary dynamics with vertical cultural transmission, an association measure between the cultural and genetic variants is important and the order of magnitude of this association as a function of the comprehensive transmission rule can be derived. More details on the connections between these theories and the following examples can be found in Feldman and Laland (1996).

Gene–Culture Evolutionary Theory

Gene–culture coevolutionary models assume that traits acquired through cultural learning can exert selection pressure on genes. This is typically modeled by assuming that transmission of a cultural trait is vertical and by describing the probability of mating between parents of different phenogenotypes, and the probability that the resultant offspring will possess traits acquired from their parents. Each combination of genes and cultural traits may have a different fitness value. A well-studied example of such gene–culture interaction concerns the evolution of the gene for lactase

persistence after the emergence of dairy farming described mathematically by Aoki (1986). Here the gene in question is an autosomal dominant with lactose absorption the dominant phenotype at this locus. The cultural dichotomy is the presence or absence of a history of dairy farming, which can be realized as the behaviors of drinking or not drinking milk in adulthood. The frequency of lactose absorbers in populations with dairy traditions reaches over 90% in Northern Europe, while in those populations without such a tradition, for example, the Pima of the Americas or the Yoruba of Nigeria, it is typically below 20%. In modeling the joint evolution of the gene and the custom of dairying, both natural selection due to increased nutrition provided by milk and the cultural transmission of milk use are affected by the genotype at the lactose-absorbing locus.

In Aoki's model, we can label the genetic locus **A** with alleles A and a representing lactose absorption and non-absorption, respectively, and label the cultural practice of dairy farming **L** with cultural trait types L and l representing dairy farming and non-dairy farming, respectively. If A is dominant, an individual with at least one copy of the A allele is a lactose absorber. Mating between genotypes is random and the expected frequencies of the phenogenotypes are given in **Table 2**. In **Table 2**, p is the frequency of the A allele, $q = 1 - p$ is the frequency of the a allele, and s is the fitness cost incurred by not drinking milk or drinking milk and failing to absorb lactose. The probability of becoming a dairy farmer through cultural transmission of the trait is given by $f(y)$ for individuals with an A allele and by $g(y)$ for individuals with the aa genotype, where y represents the frequency of the dairy farming trait in the adult population. Thus, the expected frequencies of offspring phenogenotypes are proportional to the product of the gene frequency, the frequency of the cultural trait in the population, and the relative fitness of the phenogenotye.

Analysis of this model suggests that the fate of the absorption allele critically depends on the rate of vertical transmission of milk use. If this rate is very high, then a significant fitness advantage to absorbers can shift the frequency of the dominant allele to high frequencies in as few as 300 generations (see also Feldman and Cavalli-Sforza, 1989).

The spread of agriculture into geographical areas previously occupied by hunter-gatherers has been a fruitful subject for students of genetic and cultural evolution. Aoki and Shida (1996) used a reaction–diffusion process to model the spread of farming. Their analysis included a horizontal transmission process converting hunter-gatherers to farming as well as different intrinsic growth rates for initial farmers, converted farmers, and hunter-gatherers. This analysis produced conditions under which farming would advance at a constant rate and, in addition, a gene frequency cline would simultaneously form. This study significantly extended the earlier analysis by Ammerman and Cavalli-Sforza (1971), which was based on R.A. Fisher's famous model for the advance of an advantageous gene (Fisher, 1937).

A third example of gene–culture coevolution concerns the well-documented cultural bias against daughters in South and East Asia (Das Gupta, 1987; Tuljpurkar et al., 1995). Under the assumption that a preference for sons is vertically transmitted, Kumm et al. (1994) studied how this transmission might affect the evolution of sex-determining genes. They showed that if parents act to increase the proportion of sons, irrespective of the biologically set sex ratio among their children, and if they compensate for lost daughters by having further children, the sex ratio would evolve to be female-biased. On the other hand, if parents try to achieve a desired sex ratio among their children and in so doing have fewer children than impartial parents, the primary sex ratio will become male-biased.

Table 2 Gene–culture model for lactose absorption

	L	l
AA	$p^2 f(y)$	$p^2[1 - f(y)](1 - s)$

aa	$q^2 g(y)(1 - s)$	$q^2[1 - g(y)](1 - s)$

Aoki, K., 1986. A stochastic model of gene–culture coevolution suggested by the 'culture historical hypothesis' for the evolution of adult lactose absorption in humans. Proceedings of the National Academy of Sciences of the United States of America 83, 2929–2933.

Cultural Niche Construction

Gene–culture coevolutionary theory generally invokes fixed parameters to describe the effects of a cultural trait on natural selection pressures and the frequency of that trait in the population (Laland et al., 2001). Cultural niche construction models allow for more general situations (Ihara and Feldman, 2004; Kendal et al., 2005; Odling-Smee et al., 2003; Laland et al., 2001). A strong example of a less straightforward gene–culture relationship is the prevalence of the *HbS* allele among populations of yam farmers in West Africa (Durham, 1991). In this case, farmers cleared areas of forest for yam cultivation, increasing standing water, which acted as a breeding ground for mosquitoes. The mosquitoes in turn increase the spread of malaria and thus strengthen selection for the *HbS* sickle cell allele, which confers some resistance to malaria in heterozygotes. To model such systems, one must take account of the frequency of the cultural trait, the effect of the trait on the environment, noncultural effects on the environment, and the effect of the environment on the spread of genetic and cultural traits. In the *HbS* example, the cultural trait of forest clearing formed a niche for the spread of malaria. Ihara and Feldman (2004) made the first model of purely cultural niche construction in which one cultural trait (e.g., education of women) forms a 'cultural niche' in which another culturally transmitted trait (e.g., preference for controlled fertility) may evolve. They showed that this kind of context dependence for cultural transmission can have profound effects on the dynamics of a cultural trait, and the demography of the population.

Simulation Approaches

Advances in the availability and power of computational resources including high-level agent-based modeling software packages have made the simulation studies of cultural evolution, gene–culture coevolution, and cultural niche

construction easier and more productive. It is now possible to use simulation to construct both agent-based models of cultural evolution and to use computationally intensive numerical methods to gain insight into models of cultural evolution that may be too complex to solve analytically.

Agent-based simulations have been extended to include spatial and demographic components that were previously difficult or impossible to investigate. One notable recent example is the Social Learning Strategies Tournament (SLST), which ran in 2010 and was designed by Luke Rendell and Kevin Laland at the University of St. Andrews (Rendell et al., 2010b). The tournament followed the example of Axelrod (1984) who ran the famous cooperation tournament. However, in the absence of an appropriately flexible social learning 'game,' the SLST used a multiarmed bandit structure. Participants were invited to suggest social learning strategies that would maximize the reproductive fitness of the individuals using their strategy. The winner out of 114 entries was Discount Machine, a strategy that relied heavily on social learning, innovating only when it was at the very start of a simulation round, and had no available role models to copy. Questions about the effect of these different social learning strategies on the characteristics of the cultures that emerged in the simulations were answered specifically by Rendell et al. (2011a). Smaller scale simulations have attempted to address similar questions, comparing a small number of social learning strategies in detail and assessing their comparative efficacy in an evolutionary framework (e.g., Kameda and Nakanishi, 2002; Rendell et al., 2010a), or testing typical assumptions, such as the faster rate of cultural evolution compared to genetic evolution, made in many analytical and simulation models (Franz and Nunn, 2009).

Geographic effects on models of cultural evolution and cultural niche construction have also been shown through simulation to be important. For example, Rendell et al. (2010a) found that spatial clustering allowed for the evolution of social learning even when this lowered the average fitness of the population, and following a simulation framework proposed by Silver and Di Paolo (2006), Rendell et al. (2011b) showed that spatial structure allowed for runaway cultural niche construction and secondary hitchhiking of costly traits where they would otherwise not occur. Agent-based simulations in this vein tend to invoke a grid of populations or individuals with wraparound boundary conditions. A different approach was taken by Shennan (2001) who, again borrowing from the literature on genetic evolution, assumed a simple vertical learning rule and investigated the effects of innovation and selection on the evolution of culture, an approach extended by Powell et al. (2009) to include the effects of demography and spatial structure.

Extensive computation of deterministic systems can also be used to explore the parameter space of complex transmission models. For example, Creanza et al. (2012) investigated over 25 million parameter combinations of transmission parameters and levels of cultural assortative mating in their model of cultural niche construction and found rare cultural polymorphisms that would have been otherwise difficult to find.

Abstract

Early conceptualizations of cultural geography by the Berkeley School tended to focus on the morphology of cultural landscapes. Cultural geography has since developed from being a subdiscipline into a dominant critical perspective within the social sciences. Developments in cultural geography in the 1990s focused on questioning various cultural representations (landscape as text). Subsequent work questioned the theoretical and political status of 'culture,' with the effect of blurring taken-for-granted distinctions between culture, nature, and economy. More recently, cultural geography has been developed further through an engagement with 'more-than representational' thinking and the 'mobilities' paradigm.

Cultural geography as a subdisciplinary category has been credited as being "perhaps the most ambiguous term in the discipline's lexicon" (Price and Lewis, 1993), for two reasons. Firstly, the term 'culture' is often not defined; there is simply an "easy coupling with geography in which both refer to a general sensitivity to issues of context, difference, and the local" (Barnett, 1998: 631). Secondly, there has been a proliferation of cultural geographical approaches since the 1980s: "the revival of cultural geography in a radically new form was one of the most striking [disciplinary] developments of the 1980s" (Gregory, 1994: 98).

Cultural geography has developed from being a subdiscipline into a dominant critical perspective within the social sciences. The Berkeley School, with its focus on the relationships between cultural groups and natural environments, dominated Anglo-American cultural geography until the 1980s. Developments in cultural geography in the 1990s focused on various cultural representations (landscape as text, or way of seeing) and on a variety of ways that cultural identities and places are intertwined. This work questioned the theoretical and political status of 'culture,' with the effect of blurring taken-for-granted distinctions between culture, nature, and economy. More recently, this work has been developed further through an engagement with 'ways of telling' in terms of a more narrative approach to landscape (Daniels and Lorimer, 2012) as well as through 'more-than representational' thinking and the emerging 'mobilities' paradigm (Sheller and Urry, 2006; Adey, 2009).

The Berkeley School

The term 'cultural geography' can be traced to nineteenth-century German scholarship, but is thought to have been introduced into American geography in the 1920s by Carl Sauer (Price and Lewis, 1993). Sauer, his colleagues in the geography department at Berkeley, and their students dominated American cultural geography until the 1980s. (This is not to say that this was the only strand of 'traditional' cultural geography. For an overview of a broader range of traditional cultural geographies, see Foote et al., 1994.) Sauer (1925) framed cultural geography in opposition to environmental determinism, which he criticized for subjecting the diversity of cultures to a monocausal, nomothetic theory. Sauer instead advocated historical synthetic accounts of human interaction with natural environments. For Sauer, landscape study was an exercise in historical reconstruction that sought to show how a particular cultural group, working on and through the natural landscape, enacted a cultural landscape. The relevant unit of observation was the cultural region, defined as an area over which a functionally coherent way of life dominated, echoing the French geographer Vidal de la Blache's perspectives on *genres de vie* (ways of life). Members of the Berkeley School explored a range of themes in mostly rural locations: the migration of human groups and the process of adaption of a familiar culture to a new land; the domestication of plants and animals; the development, intensification, and dispersion of agriculture; ancient cultivation systems; and the genesis and diffusion of cultural traits and material culture such as folk housing (for a review see Mathewson, 1998).

In the early 1980s, as new approaches to cultural geography were developed, a (contested) critique of the Berkeley School emerged. Berkeley School cultural geography was charged with conceiving cultural groups and regions as unities, and deploying a superorganic conceptualization of culture that invested agency in culture rather than individuals and ignored power relations (Shurmer-Smith and Hannam, 1994). However, there has been a renewed appreciation of the cultural ecology tradition that grew out of the Berkeley School (Willems-Braun, 1997). Crang (1998: 16) has drawn attention to the ways in which Sauer bound the material and social, viewing crop species and gene pools, for example, as the "material expression and embodiment of social processes and knowledge."

New Cultural Geographies

In the 1990s a new generation of cultural geographers began to engage with a diverse range of philosophical traditions, and social and cultural theories from cultural studies, anthropology, and sociology such that the subdisciplinary – indeed disciplinary – boundaries of cultural geography became blurred. The so-called 'linguistic' turn was felt throughout the social

sciences and humanities; in cultural geography it focused attention on the landscape as text and the politics of the representations that geographers produce with the publication of Peter Jackson's (1989) influential text *Maps of Meaning* and the subsequent establishment of new academic journals such as *Ecumene* which would later evolve into *Cultural Geographies* (Crang and Mitchell, 2002). As Crang and Mitchell (2000: 2) argued, this journal would illustrate research aimed at "the wider deployment and development of cultural geographic imaginations: as part of returns to the 'traditional' humanities – history, literature studies, art criticism and philosophy – and through the emergence of newer interdisciplinary fields of cultural, media, queer, postcolonial, gender, environmental, urban and science studies. It is these transdisciplinary shifts that are placing cultural geographies at the centre of a more extensive intellectual landscape." They then went on to argue that *Cultural Geographies* sought to map out "the intellectual field of cultural geography not in terms of opposing camps – such as 'new' cultural geography and 'old' cultural geography – but by bringing together concerns over the cultural geographies of knowledge, landscape, nature and environment, and space and place" (Crang and Mitchell, 2002: 1). This has been acknowledged as helping to theoretically invigorate cultural geography in the US (Olwig, 2010). It also heralded an emphasis in innovative qualitative methods in cultural geography (Shurmer-Smith, 2003, DeLyser and Rogers, 2010). Nevertheless, a continuing theme has been in terms of mapping and reading cultural landscapes in variously nuanced ways (Mathewson, 1998, 1999; Mitchell, 2002; Crang, 2003; Della Dora, 2009).

There has been a long tradition of 'reading' the landscape in cultural geography. Peirce Lewis (1979: 12), for example, described the landscape as 'our unwitting autobiography.' Since the 1980s, however, the metaphor of landscape as text has been pursued more rigorously through a fuller engagement with literary and cultural theory; for example, in Duncan's (1990) now-classic study of the Kandyan Kingdom in early nineteenth-century Sri Lanka, he describes how the king of Kandy concretized two intertwined discourses on kingship through a massive city-building program, in an attempt to secure his political power; this landscape transformation was then interpreted differently by the king, nobles, and peasants, through the lens of the two key texts. The story, then, is of intertextuality, of the interplay of discourses enacted in landscape and texts.

This textualization of landscape has itself been criticized, less in relation to Duncan's specific empirical application than as a general theory of landscape interpretation. It has been criticized for erasing process (Gregory, 1994), for overemphasizing the coherence of texts and landscapes, and for suppressing traces of nonhuman others: "it treats the landscape as a blank page that only human actors can read and write upon" (Demeritt, 1994: 170). Nevertheless, the metaphor has been reworked, for example, around the notion of theater and the script, to draw out the open, performative possibilities of text – partly structured and partly improvised. Gregory (1999), for example, analyzed the scripting of Egypt in the nineteenth century by a growing tourism industry. European tourists not only read voluminously when traveling down the Nile, the guidebooks also provided stage directions for transforming *dahabeeah* (floating barges) into 'secure viewing platforms' and the remains of ancient Egypt were literally and materially staged as an 'extended exhibition.' It is this attention to the materiality and spatiality of writing, in this case travel writing, that distinguishes the work of cultural geographers (Duncan and Gregory, 1999).

The humanistic geographers of the early 1980s were drawn to the textual metaphor; Cosgrove (1985) entreated them to pay closer attention to the visual, as a way of understanding one of their key, though untheorized, concepts, that of landscape. In Gregory's (1994: 98) assessment, this recognition of the 'conceptuality' of landscape was one of the 'cardinal achievements' of the revival of cultural geography in the 1980s. Cosgrove traced the emergence of landscape as a visual ideology, as a way of seeing, in fifteenth- and sixteenth-century Europe. The discovery of linear perspective enabled a realist illusion of space: "Landscape is thus a way of seeing, a composition and structuring of the world so that it may be appropriated by a detached individual spectator to whom an illusion of order and control is offered through the composition of space according to the certainties of geometry" (Cosgrove, 1985: 55). This way of seeing coincided with and supported a transition from feudalism to capitalism, and new social relations with nature, and land as property. What landscape paintings achieve aesthetically "maps, surveys, and ordnance charts achieve practically" (Cosgrove, 1985: 55); this recognition led to a critical reassessment of another of geographers' representational forms: the map. The assumed link between reality and representation has been broken, and maps are now read as "mechanisms for defining social relationships, sustaining social rules, and strengthening social values" (Harley, 1992: 237), as 'technologies of power' and as 'performances' (Pinder, 2007: 459). Kitchin and Dodge (2007: 331) take this a stage further and urge us to "rethink cartography as ontogenetic in nature; that is maps *emerge* through practices" such that "mapping is a process of constant reterritorialization."

Issues of power, politics, and performances have thus become central concerns for contemporary cultural geographers (Jackson, 1989; Shurmer-Smith and Hannam, 1994). Landscapes not only express social relations, they are also an important means of enacting them. And landscapes, like maps, are such effective technologies of power because they tend to naturalize these relations (Cresswell, 1996; Mitchell, 1996). Critical attention has also been given to the various cultural geographies that constitute colonial relations, in the past and in the 'colonial present' as well as with issues of racism, nationalism, identity, location, belonging, diaspora, and memory (Sidaway, 2000; Nash, 2002, 2003; Price, 2010; Tolia-Kelly, 2010).

Developing from this, cultural geographers have drawn from Bruno Latour and Donna Haraway to interrogate the assumed duality between nature and culture (Demeritt, 1994; Mitchell, 1995; Matless, 1996, 1997). There are two issues at stake. First, the division between nature and culture enforces the view that humans are the sole social agents. An artifactual understanding of nature pluralizes agency; cultural geographers are now willing to consider that we live in a livelier world in which nonhuman actors also have agency. The notion of agency has been reworked, away from that of a conscious and

controlling self, to one of having effects. Second, conceptualizing the boundary between nature and culture as a social construction has opened up a rich set of investigations around both the production of the boundary and slippages across it. In particular, Sarah Whatmore (2006) has been at the forefront of developing materialist concerns, which engage with science and technology studies and issues of performance (see below) to theorize a 'more-than-human world' in which nature and culture are articulated as 'lived.' She further argues that both 'old' and 'new' cultural geographies have sought to "cast the making of landscapes (whether worked or represented) as an exclusively human achievement in which the stuff of the world is so much putty in our hands" (Whatmore, 2006: 603). Instead, she argues drawing upon the philosopher Gilles Deleuze for conceptualizing nature and culture in terms of 'livingness.' Moreover, the lines between economy and culture are no less blurry particularly when we examine issues of consumption, urbanization, and the mobility of capital (Jackson, 2002; Castree, 2004; Gibson and Kong, 2005; Amin and Thrift, 2007; Thrift, 2012). Economic development is increasingly about culture, whether it be in the form of tourism or the redevelopment of urban areas for the purposes of spectacle and consumption. Access to jobs and job performances are increasingly interpreted as cultural phenomena and cultural geographers have begun to examine this in the context of hospitality work (Bell, 2007).

Performances and Performativities

More recently, cultural geographies have taken a particular interest in practices of tourism, which had previously been approached from either anthropological or managerial perspectives. Cultural geographers were at the forefront of the launch of more theoretically orientated and informed academic journals, such as *Tourist Studies* and *Tourism Geographies*, as well as with a more explicit engagement with theory in longer established journals such as *Annals of Tourism Research*. As Franklin and Crang (2001: 3) point out, "tourism has broken away from its beginnings as a relatively minor and ephemeral ritual of modern national life to become a significant modality through which transnational modern life is organized." Rather than analyzing aspects of cultural tourism per se as a somewhat elite activity, they have sought to challenge some of the taken-for-granted dualisms in the analysis of tourism such as the distinction between the everyday and the exotic (Hannam and Knox, 2010). The close ties and connections between what we do at home and what we do on holiday have been explored by Knox (2009) in an account of mass tourism in the Mediterranean. Gale (2009) further backs this up with his study of the 'Paris plage,' the synthetic beach located on the banks of the Seine in Paris on which office workers, tourists, and local leisure-seekers engage in a simulation of beach tourism in the heart of the city.

Latterly, and perhaps more importantly, this has focused attention on the theorization of various embodied practices and experiences, touristic, or otherwise. The classic Cartesian mind/body dualism led many thinkers to consider minds and bodies as separate entities rather than recognizing their interconnectedness in the experience of being human. It is no longer a question of human subjects being considered to be a mind within a body, but about thinking beyond that dualism to see humans as embodied beings. As an example, tourism offers a range of physical and sensual stimuli that reassert the embodied nature of human life: the warmth of the sun on the face, water lapping around your feet, the increased heart rate while riding the roller coaster, the discomfort of the long-haul flight, the upset stomach, the hotel massage, the feelings of being under the influence of alcohol, the bumps of a rickshaw, or even of dancing (Hannam and Knox, 2010).

Some aspects of, and kinds of tourism easily lend themselves to being described as performances. The notion of performance, however, has a much wider and more significant meaning in the social sciences than simply those times when people dress up in costumes and follow scripts, act on a stage, or sing and dance. However, tourism as an industry or cultural activity is however very much tied up with the presentation of place, culture, heritage, or events, and these presentations could be said to take place on stages that are created out of the interaction between destinations or attractions and their staff and visitors. Edensor (2001) took the metaphor of performance further by casting tourists, marketeers, attraction staff and managers, and tour guides as the playwrights, directors, and stage crew.

Building on the notion of performance, since the late 1990s a number of cultural geographers (Nash, 2000; Lorimer, 2008; Wylie, 2010) have sought to develop nonrepresentational forms of theorization by considering the notion of 'performativity.' Performativity is an attempt to "find a more embodied way of rethinking the relationships between determining social structures and personal agency" (Nash, 2000: 654). By nonrepresentational, these writers argue that researchers should not just focus on texts and reading or images and their processing, but also ways of trying to think about and write about physical or emotional behaviors that do not readily lend them to being written about. Nonrepresentational theories challenged the status of social constructionist understandings of the world by highlighting some of the limitations of the representational approaches to studying cultural landscapes outlined above.

Nigel Thrift (1997: 126–127) argues that nonrepresentational theory is about "practices, mundane everyday practices, that shape the conduct of human beings toward others and themselves at particular sites." It is a project not "concerned with representation and meaning, but with the performative 'presentations,' 'showings,' and 'manifestations' of everyday life." It seeks to appreciate the ways in which ordinary people appreciate "the skills and knowledges they get from being embodied beings." Drawing upon Thrift's work, Nash (2000: 655), meanwhile, argues that the notion of performativity "is concerned with practices through which we become 'subjects' decentred, affective, but embodied, relational, expressive and involved with others and objects in a world continually in process. … The emphasis is on practices that cannot adequately be spoken of, that words cannot capture, that texts cannot convey – on forms of experience and movement that are not only or never cognitive." This was further developed into what has been termed 'more-than representational' theory in order to incorporate the insights of landscape analysis with the new emphasis on embodied

encounters (Lorimer, 2005, 2008). Landscapes are retheorized from this perspective as 'traveling landscape-objects' (Della Dora, 2009). Cultural geographers have examined such embodied encounters through, for example, the analysis of nonrational spectro-geographies (Maddern and Adey, 2008), lethargy and tiredness (Bissell, 2009), and touristic activities in slum spaces (Diekmann and Hannam, 2012), but also through the diverse aeromobilities and automobilities discussed below.

Mobilities

Developing from the concern with embodied practices and recognizing that cultures are not static, cultural geographers have also been concerned with everyday practices of movement (Adey, 2009; Price, 2010) and have been active, along with sociologists and anthropologists, in the development of what has been termed the 'new mobilities paradigm' (Sheller and Urry, 2006). In short, proponents of the mobilities paradigm argue that the concept of mobilities is concerned with mapping and understanding both the large-scale movements of people, objects, capital, and information across the world, as well as the more local processes of daily transportation, movement through public space, and the travel of material things within everyday life simultaneously (Hannam et al., 2006).

A great deal of mobilities research has analyzed forms and experiences of so-called 'corporeal' travel. This involves the travel of people for work, leisure, family life, pleasure, migration, and escape, organized in terms of contrasting time–space modalities (ranging from daily commuting to once-in-a-lifetime exile). Using an explicit mobilities perspective, recent work has considered how the technologies of travel have led to new cultural forms, including new cultural identities and subjectivities (see Blunt, 2007). It is recognized that political, technological, financial, and transportational changes have been critical in significantly lowering the mobility barriers for many but not for all. Indeed immobilities become particularly apparent during times of crisis and disaster (Hannam et al., 2006) and social mobilities may be marked by inequalities and injustices (Cresswell, 2010).

The conceptualization of places is important for the study of mobilities in this context (Cresswell, 2004). Often a clear distinction is made between places and those traveling to places; pushing or pulling people to visit. The mobilities paradigm argues against the ontology of distinct 'places' and 'people' (Sheller and Urry, 2006). Rather there is a complex relationality of places and persons. Places are thus not so much fixed but are implicated within complex networks through which 'hosts, guests, buildings, objects, and machines' are contingently brought together to produce certain performances. Moreover, places are also "about proximities, about the bodily co-presence of people who happen to be in that place at that time, doing activities together, moments of physical proximity between people that make travel desirable or even obligatory for some" (Hannam et al., 2006: 13).

From this perspective, cultural geographies have also become concerned with aspects of transport, of mapping the various aeromobilities and automobilities of everyday life (Cresswell, 2010). The sociotechnical system of air travel that has been turned into a form of mass mobility requires an exceptionally extensive and immobile place, the airport city with tens of thousands of workers orchestrating the millions of air journeys taking place each day (Hannam et al., 2006). At airports, travelers have their bodies biometrically scanned or 'read' and are continually monitored on CCTV. That symbol of national allegiance and identity – the passport – is now 'chipped' and used by governments as a tool to monitor the population's movements. The objects people carry, too, are also subject to processes of control through X-rays and searches. Moreover, the very material and immaterial architecture of the modern airport is calculated to control the corporeal movements of the traveler (Adey et al., 2007; Adey, 2008). When this breaks down due to an unexpected environmental event such as the Icelandic ash cloud eruption the consequences can be extreme (Adey and Anderson, 2011).

Through the notion of automobility, personal vehicles may effectively offer the tourist freedom and flexibility other modes of travel do not (*see* Automobility). Cars enable people to tailor their own itineraries and allow them to control the routes they travel between destinations. They also permit the driver (and his or her passengers) to decide when and where to stop, and consequently allow direction and velocity to be controlled. As Urry (2000: 61) has noted, the road has the power to 'set people free' as drivers are offered a range of choices, inaccessible to those using public methods of transport. Cars are therefore identified as important tools that may permit adventure (Sheller and Urry, 2000, 2003; Featherstone, 2004; Huijbens and Benediktsson, 2007; Collin-Lange and Benediktsson, 2011; Butler and Hannam, 2012) and have consequently fostered a 'dynamic culture of individualism' (Jacobsen, 2004: 7) but with significant consequences for the global environment (Vanderheiden, 2006).

Phillip Crang (2010: 192) recently argued that "cultural geography is no longer fashionable" but remains lively, creative, and experimental as the above discussions illustrate. Cultural geography is currently extremely vibrant, no longer operating as a bounded subdiscipline concerned simply with landscapes but as a critical perspective on everyday life.

Cultural Heritage

Christoph Brumann, Max Planck Institute for Social Anthropology, Halle, Germany

Abstract

Cultural heritage includes the sites, things, and practices a society regards as old, important, and worthy of conservation. It is currently the subject of increasing popular and scholarly attention worldwide, and its conceptual scope is expanding. Most social scientists emphasize its functions for supporting ethnic, national, and elite interests but others point to its creative and counterhegemonic sides. The article reviews the relation of heritage with tourism and nostalgia, dissonant/negative heritage, heritage and religion, rural and urban heritage, and heritage institutions, in particular the United Nations Educational, Scientific and Cultural Organization and its conventions. People's personal attachments to heritage deserve further study.

Cultural heritage is usually taken to mean the sites, movable and immovable artifacts, practices, knowledge items, and other things that a group or society has identified as old, important, and therefore worthy of conscious conservation measures, often at the hands of specialized institutions. This invariably comprises only a selection of the total cultural repertory, much of which may not be perceived with similar consciousness. Such a use of 'heritage' is a relatively recent extension of the original lexical meaning of individual heirloom to a collective level, as is also true for corresponding terms in other languages such as 'patrimoine'/'patrimonio.' Cultural heritage overlaps with a number of other phenomena and terms, to the point of interchangeable usage, such as cultural property (which is often more clearly delimited and not always old), tradition (which more clearly points to collective practices and to informal modes of transmission, excluding, for example, the works of individual artists that might nonetheless be seen as heritage), social memory and sites of memory/'lieux de mémoire' (where the focus is on contemporary commemorative practices), and culture (which in its broad anthropological sense is not restricted to old and publicly recognized things). Tradition in the sense of public traditions is particularly close in meaning, and it appears that much that was discussed under this term in the 1980s is now coming back under a new label. In general, cultural heritage is less used as an analytic term in anthropology where alternatives such as culture, material culture, or performative culture are preferred; rather, it points to the public gaze on old cultural things that is of interest as a social phenomenon.

Attention for and reference to cultural heritage is growing, with many commentators diagnosing a 'heritage boom' or even a 'cult of heritage' in contemporary Western society from sometime around the 1960s on. This includes a conceptual expansion where things previously thought unworthy such as petrol stations, hay barns, or everyday dishes qualify for heritage status too. Intangible cultural heritage is establishing itself as a new category, including performances, crafts, and more ephemeral entities such as cultural spaces, and there is even talk of digital heritage now. Not only nation states, local communities, and civil-society organizations participate in this process but also international bodies such as the United Nations Educational, Scientific and Cultural Organization (UNESCO), and they have helped to spread heritage discourses and practices to all corners of the globe. Heritage conservation is universally acknowledged as a moral obligation, and the days when high modernism and socialist cultural revolutions aimed to wipe out large portions of the past in favor of a new society appear remote now.

The bulk of the total textual production on heritage is celebratory, and the bulk of academic research is still done in such fields as art history, architecture, and archaeology on the heritage items proper and on the practical problems of their conservation and presentation, such as restoration techniques, management questions, or juridical aspects. Museum studies have long established themselves as an independent domain. The social sciences contribute modestly to these applied fields, such as when investigating the social messages of museums and exhibitions, when estimating the monetary value of cultural goods, or indirectly when training museum and conservation practitioners (such as curators in ethnographic museums who have degrees in anthropology).

The remainder of this article, however, is concerned with the basic research done by anthropologists, sociologists, geographers, and modern historians on the social, political, and economic contexts of cultural heritage and its conservation *in situ*, which is outside an indoor museum or archival context. Corresponding to the general growth of attention, this is a burgeoning field, with new training centers and interdisciplinary programs in 'World Heritage Studies' and the like mushrooming and book series and journals such as the *International Journal of Heritage Studies* and the *International Journal of Cultural Property* blossoming. The founding conference of the Association of Critical Heritage Studies in Gothenburg (Sweden) in 2012, for instance, attracted 500 paper proposals – five times as many as expected – and a large majority did not employ a narrowly applied perspective.

Dominant in this new strand of research is a critical approach that for specific heritage items or 'heritagization' in general pinpoints the gaps between official, most often celebratory discourses, and the actual historical trajectories, selective amnesia, and true motives – often of commercialization and collective self-elevation – involved. Four common assumptions dominate these analyses, which the author has elsewhere called falsification, petrification, desubstantiation, and enclosure (Brumann, 2009). In an often taken-for-granted way, labeling places, things, or practices as cultural heritage is

assumed to falsify 'real' history; petrify what may no longer evolve as freely as more ordinary, unmarked culture; strip it of its original values and meanings, leaving only the heritage label; and claim it as the possession of a particular community, ethnic or religious group, class, or nation, thereby excluding other such groups. Such assumptions are shared by the founding figures of current critical heritage studies, such as geographer David Lowenthal (1985, 1996) or cultural historian Robert Hewison (1987). But they are also often present in a slightly older interest in the selective appropriation of traditions for contemporary purposes, traditions which in most cases just as well could be labeled heritage. Eric Hobsbawm and Terence Ranger's 'invention of tradition' approach (1983) has proved stimulating across the social sciences and humanities. In the most famous case study of the volume, historian Hugh Trevor-Roper dismantles the myths surrounding the kilt, showing how army regiments, nationalist urban intellectuals, a fraudulent brother pair, and a cloth manufacturer smelling business all contributed to transforming the eighteenth-century creation of an Englishman into the timeless emblem of Scottishness. In addition to Hobsbawm and Ranger's home discipline of history, anthropologists have been particularly receptive to this approach, providing scores of similar case studies. They have also been most active in dismantling the idea of true history lying beneath the beautification of official traditions, as inherent in Hobsbawm's distinction of 'custom' and 'genuine traditions' from the invented ones (1983: pp. 2–3, 8). Instead, Handler and Linnekin argue that "[t]he origin of cultural practices is largely irrelevant to the experience of tradition; authenticity is always defined in the present. It is not pastness or givenness that defines something as traditional. Rather, the latter is an arbitrary symbolic designation; an assigned meaning rather than an objective quality" (1984: p. 286). This leaves socially positioned claims about the past only. Particularly in indigenous rights claims, such a relativist position has proved quite challenging to sustain (cf. e.g., Clifford, 1988: pp. 277–346; Hanson, 1989, 1991).

The four common assumptions are also present in archaeologist Laurajane Smith's (2006) widely quoted formulation of the "authorized heritage discourse" or "AHD." She likewise argues that heritage is not simply there but constituted through social practice, and while the AHD and its claim of salvaging the past for the (nebulously defined) benefit of future generations serve the interests of the middle and upper classes and nationalist aspirations, their main function is to strengthen the control of professional experts and institutions over the heritage in question. This tendency often prevails even against these specialists' best intentions, and it tends to disregard the expertise and deny the rights of nonprofessional heritage carriers, especially subaltern ones such as the working class or indigenous peoples. Even more sinister is heritage in the cultural criticism formulated by British authors who see the boom as a sign of general malaise. "Worship of a bloated heritage invites passive reliance on received authority, imperils rational inquiry, replaces past realities with feel-good history, and saps creative innovation," writes David Lowenthal (1996: p. 12) and sees "[p]rejudiced pride in the past" as "not a sorry consequence of heritage; it is its essential purpose" (1996: p. 122). And archaeologist Kevin Walsh finds that "[h]eritage successfully mediates all our pasts as ephemeral snapshots exploited in the present … to guarantee the success of capital in its attempt to develop new superfluous markets" (1992: p. 149). Several commentators have seen such attacks as amounting to 'heritage-baiting' (Pickering and Keightley, 2006: p. 934; Samuel, 1994: p. 263).

Yet there are also more benign views of the social role of traditions and cultural heritage and caveats against a purely deconstructive analysis. Anthropologist Marshall Sahlins has charged the invention approach with being functionalist. Using the example of sumo wrestling, a famous piece of Japanese cultural heritage whose modern appearance is clearly a nineteenth-century creation, he questions whether the latter can be explained by "some group's quest for power, material gain, resistance or a need of identity" alone (1999: p. 407). He rather argues that "[m]odern sumo is clearly a permutation of older forms and relationships … That it might be suitably reinvented to fit the occasion might better be understood as a sign of vitality rather than of decadence" (1999: pp. 408–409). "[I]nventiveness of tradition" (1999: p. 408) is therefore the more apposite phrase, and Terence Ranger himself would prefer "invention by" – rather than "of" – tradition in hindsight (1993: p. 76). Such creativity itself may be an indicator of traditionality, as argued by anthropologist Christopher Tilley (1997) who, after thoroughly deconstructing a ritual performance that his Wala informants devised for a tourist audience, points out how this bricolage follows a very traditional Melanesian mode of recombining home-grown and imported cultural resources into new forms. The alleged political conservatism of cultural heritage has also been questioned. Historian Richard Samuel emphasizes that preservation is politically chameleonic, "subject to quite startling reversals over very limited periods of time" (1994: p. 303) and "[h]istorically … a cause which owes at least as much to the Left as to the Right" (1994: p. 288). The latter is certainly borne out by the experience of urban residents the world over in their uphill battles against hegemonic development interests transforming old neighborhoods (e.g., Brumann, 2012). All this speaks strongly for attention to the details.

There is, however, a considerable number of empirical studies now that implement such a program, dissecting the multiplicity of voices and interests surrounding cultural heritage and focusing not just on the official spokespeople and discourses but also laypeople's, nonofficial, and subaltern views. Anthropologists in particular have provided in-depth ethnographic studies. In his book on the Cretan town of Rethemnos (Rethymno), Herzfeld (1991) distinguishes between the 'monumental time' implicit in government protection of the medieval and early Renaissance architecture of the historic center, associated with the Venetians, and the 'social time' of the residents and their everyday lives. Conservation requirements imposed by external, mainly national, agencies and the manifold constraints on building alterations and extensions frustrate the residents. Yet in the course of time, many have also discovered the economic opportunities of tourism to the town, leaving them divided about the heritage regime. Joy (2011) describes the challenges that the World Heritage inscription of the mud architecture of the city of Djenné in Mali brings to its

residents. The legacy of French colonial romanticism and a national government intent on gaining a place on the global cultural map imposed a conservation regime that helps to attract foreign tourists as one of the few sources of income. Yet many citizens feel a heavy burden when the regular remudding of houses consumes more resources than the less 'authentic' tiling of facades and when in a poverty-stricken environment, basic amenities such as a canalization are still lacking. An uneven distribution of benefits is also apparent at Chichén Itzá in Mexico, as reported by Breglia (2006). While everyone is proud of the global recognition of the site, almost the entire profits from the intense tourism bypass the local residents, with the single exception of the family that still privately owns the land on which the famous buildings stand. A handful of Mayan families, however – often the descendants of the workers who once excavated the site – retain their moderate privileges as the employed guards and shopkeepers, even when due to the relocation of their houses outside the boundaries, some of their personal ties to heritage, such as their football matches beneath the Great Pyramid, have been cut. More broadly distributed are the benefits of heritage in the rediscovery of the courtyard houses in the old city of Damascus, as studied by Salamandra (2004) prior to the current civil war. Old families, often from the former professional and entrepreneurial elite, had left for the suburbs, renting out the subdivided houses to rural migrants, but now they reclaim their homes, converting them to new purposes such as shops, galleries, and restaurants. Salamandra sees them as asserting symbolic dominance over the new political leadership, which lacks a long-standing connection to the city.

In Damascus, the turn to heritage is mainly an inner-urban phenomenon but in Djenné, Chichén Itzá, and elsewhere, tourism is a major force in the political economy of cultural heritage and a key motive for the conscious rearrangement of cultural practices. In a study of Maasai and Samburu heritage performances and colonial-style high tea on carefully tended lawns at a ranch near Nairobi, Bruner and Kirshenblatt-Gimblett (1994) found that organizers, performers, and tourists, through their scripted interaction, collaborate in creating 'tourist realism.' Volkman (1990) has spoken of 'cultural editing' when analyzing the way Toraja funerary rituals on Sulawesi are shortened, brought into a neat sequence – complete with a running commentary – and cleansed of bloody animal sacrifices. Such modifications aside, however, the importance for status that is enhanced by the presence of domestic and foreign visitors continues to be the dominant factor. Playing to tourists' expectations may be a strategy to gain the resources needed for the continuation of traditional rituals deliberately kept from display, as Martinez reports for the Japanese pearl-divers' village of Kuzaki (1990). Moving beyond instrumental considerations, John and Jean Comaroff (2009) propose an entirely new take, showing how in a range of cases drawn from the indigenous United States and South Africa, commercialization and tourist display is precisely what convinces the protagonists of having an authentic and respectable cultural heritage in the first place. Tourists are not defenseless against the dominant narratives of heritage sites anyway, as Bruner (1994) demonstrates for the open-air museum of New Salem, Abraham Lincoln's erstwhile home. The visitors he talked to value a great variety of often unexpected qualities of the site and also engage with it in playful and ironic ways.

Several authors have identified nostalgia as a major force behind heritagization and heritage tourism, describing it as "an ambivalent longing to erase the temporal difference between subject and object of desire, shot through with not only the impossibility but also the ultimate unwillingness to reinstate what was lost" (Ivy, 1995: p. 10). Such sentiments and the associated visions of lost 'Gemeinschaft' wholeness are seen critically in the social sciences. Yet in a study of Stone Town, the historic center of Zanzibar City, and the range of nostalgias for different phases of the colonial and revolutionary past felt by the residents, Bissel acknowledges the possibility for these expressions to transcend a merely regressive mode (2005: p. 239). And Pickering and Keightley urge us to consider both the melancholic and the utopian potential of nostalgia, as it always entails a critique of current conditions (2006). To do so may presuppose a more fine-grained categorization such as that by Berliner (2012) who distinguishes 'endo-nostalgia' about an actually experienced past from the 'exo-nostalgia' of the Western tourists, conservation experts, and the UNESCO staff who all descend upon Luang Prabang and its Buddhist temples and colonial villas in recent years. He also emphasizes how much nostalgia is actually a transformative force in this former capital of the Lao kingdom, rather than conserving things.

Yet heritage conservation can also be motivated by the very opposite of nostalgia, a wish to preserve the memory of historical events and conditions in order to avoid their recurrence. Variously called dissonant, difficult, or negative heritage, such "places of pain and shame" (Logan and Reeves, 2008) occupy a growing portion of contemporary heritage regimes. UNESCO's World Heritage list, for example, features the Auschwitz concentration camp, the Hiroshima Peace Memorial, or the Bikini nuclear test site. Bruner (1996) studied African-American roots tourism to Elmina Castle in Ghana, the main entrepôt for the North American slave trade and itself a World Heritage site. The tourists' joint walk through the dungeons and the infamous 'door of no return' is an often overwhelming emotional experience, yet all the more disconcerting are encounters with the Ghanaians outside the castle for whom the guests are 'obruni' (whitemen) by virtue of their wealth, rather than long-last brothers and sisters returning 'home.' The meaning of such sites is often subject to constant negotiation, as Macdonald shows in her ethnography of the Nazi Party Rally Grounds in Nuremberg (2009). The site was locally downplayed in the immediate postwar period, not least because many in the (traditionally left-leaning) city felt that they were made to bear an unfair share of the Nazi legacy, but the tide changed around reunification when suspicions of negating the past became the least desirable option. Meskell (2002) has reflected on a special kind of ambiguous heritage, taking up public debates about how to interpret, preserve, and achieve 'past mastering' at Ground Zero and the empty Bamiyan Buddha niches, that is, sites of deliberate, public destruction. Aside from such signal acts, heritage may also provoke petty vandalism, such as in the 'heritage iconoclasm' Chalcraft (2012) observed in Tanzanian, Libyan, and Italian prehistoric

rock art sites and interprets as resistance to the neocolonial aspects of the heritage regime.

Such contestation may arise from the fact that the things and practices recognized as heritage retain their older meanings, contrary to what the assumption of 'desubstantiation' (see above) would let us expect. This may be an entirely harmonious cohabitation, such as in the case of Kyoto where the 'kyô-machiya' houses and the Gion matsuri festival have become celebrated cultural heritage but continue to attract people also as beautiful, atmospheric, and ecological dwellings and as occasions for festive fun, entertainment, and supernatural protection (Brumann, 2009). But there are often also tensions, particularly between heritagization and religious significance. The sacred grove of the Yoruba goddess Osun in Osogbo, Nigeria – the site of a major rejuvenation of religious sculpture in the postindependence period and of an internationally visited annual festival – has over the years strengthened its heritage status, all the way to World Heritage inscription (Probst, 2011). One supporting factor is that traditional political authorities see themselves challenged by devout Christians and Muslims when they side with pagan religion, rather than supporting an emblem of transnational Yoruba heritage. Such an uneasy balance is not always attained, as the 2001 blasting of the stone Buddhas in Bamiyan by the Taliban or the recent destructions of the World Heritage-listed sufi saints' tombs in Timbuktu attest to. Much as seeking the global stage was paramount for the perpetrators, they also challenged heritage primacy, insisting on applying a religious yardstick to what in certain fundamentalist interpretations are pagan and blasphemous sites.

The ramifications of cultural heritage, happy or sad, also depend on where exactly it is found or imagined to belong. In modern nations, the countryside, rural folk, and their traditional customs have often served as a projecting screen for – often themselves rather urban and intellectual – longings for primeval wholeness and uncontaminated values, as has been observed for a variety of countries. In my own work on Kyoto, I have ventured the hypothesis that urban cultural heritage is less easily hijacked by outsiders, given that wealth, power, and intellectual resources usually concentrate in cities, thus giving their inhabitants more defenses. Also, urban tastes for creative and cosmopolitan mixtures do not insist on presumably pristine representations of culture so much (Brumann, 2009, 2012).

Although overviews of the evolution of heritage conservation do exist (Jokilehto, 1999) and steps toward a critical social history of Western heritage institutions since their full-scale emergence in the nationalist 'long nineteenth century' have been taken (Hall, 2011; Swenson, 2013; Swenson and Mandler, 2013), a comprehensive analysis of the rise of modern institutional conservation and its key ideas, social organization, and wider contexts is still lacking. Some work on contemporary national heritage apparatuses has been done (e.g., Bendix et al., 2012; Hauser-Schäublin, 2011), notably on the Japanese system as the internationally most influential non-Western one (Brumann and Cox, 2010; Thornbury, 1997). Lynn Meskell (2012a) deconstructs the role of the governing institutions of Krueger National Park in South Africa, showing how neoliberal pressures and the hegemony of nature tourism and biodiversity lead to the neglect of the many archaeological and rock art sites in the park and also to a suppression of painful histories of racism and eviction. She is one among a growing number of practicing archaeologists who reflect in sensitive ways about the wider societal context of their own work and the involvement of heritage discourses (e.g., Karlström, 2009). Still, more studies like sociologist Nathalie Heinich's in-depth analysis of the organization, underlying values, and hidden logic of the French 'Inventaire' (2009) appear called for, given that the influence of such bodies as the Instituto Nacional de Antropología e Historia in Mexico or the Agency of Cultural Affairs (Bunkachô) in Japan is obvious from studies of cases under their governance (cf. Breglia, 2006; Brumann and Cox, 2010; Thornbury, 1997).

How exactly states deal with their cultural heritage depends increasingly on external actors. These include foundations such as the Getty Foundation, the Aga Khan Foundation, or the World Monuments Fund, the conventions and operations of international organizations such as the European Union, and the funding that bodies such as the World Bank or United Nations Development Programme provide. In particular, UNESCO with its portfolio of conventions is establishing itself as the supreme arbiter of global heritage standards and as an impetus for much national and regional regulation. Still best known and most coveted is the 'Convention Concerning the Protection of the World Cultural and Natural Heritage' adopted in 1972, which now aims to protect close to 1000 cultural and natural sites inscribed on its prestigious list – including many of the above-mentioned cases – as the shared inheritance of humanity. Charges of Eurocentrism have led to a greater receptiveness for vernacular architecture, cultural landscapes, or dissonant heritage and to a self-consciously 'anthropological' perspective. Dissatisfaction with the way the institution represents our world is growing, however, particularly among the heritage latecomers from the Global South that are now as adept at pushing their national interests in this forum as the Northern states (Brumann, 2011; Meskell, 2012b; Schmitt, 2009).

One consequence of this problem has been UNESCO initiatives to honor not only sites but also crafts, performative arts, and the like, first with proclamations of 'Masterpieces of the Oral and Intangible Heritage of Humanity' from 2001 on and then with the adoption of a full-fledged 'Convention for the Safeguarding of Intangible Cultural Heritage' in 2003. More so than World Heritage, which is widely regarded as the province of architects, art historians, and archaeologists, this process has involved anthropologists and folklorists on juries, advisory committees, and decision-making boards. Since national states are rushing to sign the treaty, this is replicated on the national level where the required institutional frameworks are currently taking shape. The governing organs of the new convention have likewise taken to listing, and what gets inscribed is partly informed by a rather conventional folkloristic perspective and partly very general – tango, the French gourmet meal, the Novruz festival. Contemporary anthropologists who are committed to more dynamic views of culture, which would see continuously evolving landscapes rather than neatly delimited and stable packages, have been skeptical of the intellectual merits of such an exercise (Kirshenblatt-Gimblett, 2004) but some also acknowledge the possibilities of

empowerment and improved preservation (e.g., Brown, 2005). Anthropologists, folklorists, and geographers pursue the institutional processes of the convention and their evolution (e.g., Bortolotto, 2010; Rudolff, 2010; Schmitt, 2008), some of them as full participants representing their countries in this arena (Hafstein, 2009; Kuutma, 2007). Several recent interdisciplinary collections attempt to take stock of the intangible cultural heritage (ICH) phenomenon too (Arizpe, 2011; Bortolotto, 2011; Smith and Akagawa, 2009). As this convention is still very much in the formative period, its further fate and growth curve will remain interesting to follow.

All global-level institutionalization and politicization aside, the fact remains that many people feel personally attached and committed to heritage things and practices. The label as such may have limited meaning for them, and their historicities may be alternative ones, such as those of festival participants in Kyoto who are less impressed by the documented great age of some of the paraphernalia but by being a link in a chain of transmission that reaches back centuries (Brumann, 2012: p. 239). Rarely are such attachments explored systematically at the individual level, although McCracken's sketch of a 'curatorial consumer' points the way (1988: pp. 44–56). Beyond all instrumentalization, things that last – resisting change and transcending our own life spans – inspire awe among many people in many societies. This throws up very basic philosophical questions about a panhuman "desire for grounded materiality" (Meskell, 2002: p. 559) and invites further studies relating heritage with the wider context of materiality, performativity, notions of (im)permanence (Karlström, 2009), and emotions in the specific cultural context. As for sentiments, critical heritage researchers may want to reflect on their own, including their positions in and funding by institutions premised on the very commitments to heritage they like to dissect.

Abstract

It is not easy to define 'cultural history.' The risk is great of failing to draw a clear distinction between cultural history and other histories, such as the history of ideas, the history of literature, the history of art, the history of education, the history of media, or the history of sciences. Should we, consequently, change perspectives and consider that all history, whatever its nature – economical or social, demographic or political – is cultural, insofar as the most objectively measurable phenomena are always the result of the meanings that individuals attribute to things, words, and behavior? In this fundamentally anthropological perspective, the problem is not so much to define the particular sphere of cultural history, differentiated from that of its neighbors, but rather avoid an imperialist definition of the category.

Between these two stumbling blocks, the road is narrow. The course followed in this article consists of marking the shifts that have characterized the historiographical practices designated, in their time or subsequently, as belonging to cultural history.

It is not easy to define 'cultural history' in its specificity. Should it be done by designating objects and practices whose study would constitute the very nature of this history? The risk is great, therefore, of failing to draw a definite and clear line between cultural history and other histories: for instance, the history of ideas, the history of literature, the history of art, the history of education, the history of media, or the history of sciences. Should we, consequently, change perspectives and consider that all history, whatever its nature – economical or social, demographic or political – is cultural, insofar as the most objectively measurable phenomena are always the result of the meanings that individuals attribute to things, words, and behavior? In this fundamentally anthropological perspective, the problem is not so much to define the particular sphere of cultural history, differentiated from that of its neighbors, but rather avoid an imperialist definition of the category.

Between these two stumbling blocks, the road is narrow. From there, the course followed in this article consists of marking the shifts that have characterized the historiographical practices designated, in their time or subsequently, as belonging to cultural history.

The History of Mentalities

The very lengthy genealogy of cultural history generally stops at a certain number of precursors: the historians of the nineteenth century (Michelet, Burckhardt), Voltaire's, *Siècle de Louis XIV*, the legal practitioners of the 'perfect history' during the sixteenth century, even Herodotus himself. The course is not without illusion, measuring the 'anticipations' of certain precursors according to a posterior state of historical science. So as to avoid this trap, it is preferable to limit the research to the twentieth century and to follow the different faces taken by the historiographical projects which intended to focus on the phenomena left aside by the classical forms of political, economical, or social history. The history of mentalities was the first among them.

The Founders of the Annales and the History of Mentalities

Unlike a given idea, the paternity of the category of the 'history of mentalities,' insofar as it indicates a particular area of history, is not to be attributed to the founders of the *Annales*, Lucien Febvre and Marc Bloch. It is the invention of Robert Mandrou and Georges Duby at the end of the 1950s. The expression appears for the first time in the title of a university course in 1956 with the election of Robert Mandrou in the Sixth Section of the Ecole Pratique des Hautes Études to the chair of 'Social History of Modern Mentalities,' while at the same time, Georges Duby was opening a seminar on 'medieval mentalities' at the University of Aix-en-Provence. In 1961, when Robert Mandrou published his book *Introduction à France, Modern*, he presented it as a response to the 'requests formerly made by Lucien Febvre in favor of the history of collective mentalities' (while using another notion as the subtitle of the study, 'psychological history' which was also dear to Febvre). Thus, designated as the inspirer of this new form of history, Lucien Febvre, in fact, had rarely used the exact term 'mentality,' preferring the adjective 'mental' added to words like 'equipment,' 'material,' but above all 'tool,' or even, in the plural form, 'habits' and 'needs.' In 1942, in the *Problème de l'incroyance au XVIe siècle: Religion de Rabelais*, he characterized the 'mental tools' by expressing two essential statements: that the ways to perceive and reason are neither invariable nor universal, and that there is no continuous and necessary progress in the succession of mental tools. The book makes an inventory of the instruments and conceptual categories which are the different supports for thinking: first, the state of language, with its vocabulary and syntactic particularities, the tools and the languages available in the operations of knowledge, and finally the value and the credit attributed to each sense. From there, the conclusion: "So close to us in appearance, the contemporaries of Rabelais are already distant by all their intellectual properties. And even their structure was not ours." Each time, the ways of thinking and feeling outline in a specific way, the limits between nature and the supernatural, or between what is possible and impossible.

Paradoxically, Lucien Febvre, taken to be the father of the history of mentalities, uses the term less often than Marc Bloch who uses it as much in the *Société féodale* (where we encounter 'mental atmosphere' or 'religious mentality') as in *Apologie pour l'histoire ou le métier d' historien*. He prefers 'sensitivity' that defines the subject of 'historical psychology' which seems for him the only capable way of avoiding the culpable anachronism which equips men and women of the past, not only with knowledge and conceptions which were impossible for them, but also with feelings and emotions that were unknown to them. Febvre stigmatizes such an error in *Amour sacré, amour profane: autour de l'Heptaméron* (1944) by concluding: "In fact, a man of the sixteenth century should be intelligible not in relation to us, but in relation to his contemporaries."

In his book of 1961, Robert Mandrou does not dissociate the study of the mental tool from that of sensations, emotions, and passions which make up the mentality. Without separating these two dimensions, he distinguishes the common elements to all men (and women) in a shared time and place and those that are particular to each generation, each profession, each social group, or each class. For him, "all historical psychology, all history of mentalities is social history." We should, therefore, once the common mental tool has been identified, describe 'the mental horizons which are characteristic of the different social groups.' The 'history of mentalities,' or of the 'visions of the world,' another term often used by Mandrou, was thus strongly anchored in the differences between social classes, defined more by the unity of lifestyle and the feeling of belonging than by a strict economical determination.

The Golden Age of the History of Mentalities

From the 1960s, the notion of mentality imposes itself to designate a history whose object is neither ideas nor socioeconomic realities. This 'French' history of mentalities reposes on a certain number of ideas more or less shared by those who practice it (see Le Goff, 1974). In the first instance, the object of the history of mentalities is defined by Le Goff as the opposite of that of classical intellectual history: "The level of the history of mentalities is that of everyday life and the automatic, which is what escapes individual subjects as it shows the impersonal content of their thoughts." These ideas, which result from the conscious elaboration of a singular spirit, are therefore opposed to mentality, always collective, which regulates, without them knowing, the immediate perceptions of social subjects. Such an expression is not very far off the definition of collective representations in the tradition of the sociology of Durkheim as the accent is placed on the contents or the methods of thinking which result from the unconscious incorporation of unknown determinations in each member of a community, which set up their common manner of classifying and judging. Now, the second characteristic underlined by Le Goff: the possibility that the history of mentalities or the historical psychology 'link themselves to another important trend of historical research today: quantitative history.' Having as subjects collective, automatic, and repetitive actions, the history of mentalities should and must be serial and statistical. It is part of the heritage of the history of economies, populations, and societies that, on the horizon of the major crisis of the 1930s, followed by the mutations after the war, constituted the most innovative field of historiography. When, in the 1960s, the history of mentalities and the historical psychology defined a new, promising, and original area of study, they did so often by recapitulating the methods which ensured the conquests of socioeconomical history: the techniques of regressive statistics and the mathematical analysis of series.

From the importance given to series, and therefore to the establishment and treatment of homogenous data, repeated and comparable at temporal regular intervals, two consequences follow. The first is the privilege given to massive sources, widely representative and available over a long period, for example, the inventories after death, wills, library catalogs, legal archives, etc. The second consists of the attempt to articulate, according the Braudelian model of different times (long term, conjuncture, event), the long period of mentalities which often resists to change, with the short period of brutal ruptures or of rapid transfers of belief and sensitivity.

The withdrawal of witchcraft as a criminal act in France during the seventeenth century (see Mandrou, 1968), the transfer of attitudes before childhood or death (see Ariès, 1964, 1977), or the de-Christianization of France during the second half of the eighteenth century (see Vovelle, 1973) illustrate the articulation of the different periods of the history of mentalities. In each case, the problem lies in understanding how, in the long-term stability of mental structure, an essential transfer occurs: thus, the transformation of the representations of the world in the milieu of magistrates, the invention of childhood, and the concealment of death, or the indifference toward devotion practices, moral injunctions, and catholic beliefs.

A third characteristic of the history of mentalities in its golden age lies in its ambiguous way of considering connection to society. The notion seems, in fact, dedicated to erasing the differences in order to find the categories shared by all the members of a same era. "The mentality of a historical individual, a great man, is exactly what he has in common with other men of his time" writes Le Goff (1974), adding, as examples, "it is what Caesar and the last soldier of his legions, Saint Louis and the peasant of his domains, Christopher Columbus and the sailor all have in common." Among all the practitioners of the history of mentalities, Philippe Ariès is no doubt the one who made the greatest attachment to such an identification of the notion as 'common feeling' or 'general feeling.' The recognition of the 'archetypes of civilization,' shared by a whole society, does certainly not signify the cancellation of all differences between social groups or between clerics and laymen. However, these differences are always considered inside a long-term process which produces representations and behavior which become common. Postulating the fundamental unity (at least tendentious) of the 'collective unconscious,' Philippe Ariès reads the texts and images, not like demonstrations of individual peculiarities, but in order to "decipher, beyond the will of authors or artists, the unconscious expression of collective sensitivity," or to "find, beneath the ecclesiastic language, the ordinary set of common representations which are obvious" (see Ariès, 1975). The sensitivity and the collective gestures which are disclosed should be understood at the crossroads of biology and the mental, and at the meeting point of demographic realities (birth, death, etc.) and psychological investments (the forms of self-consciousness, the representations of life

after death, the feeling of childhood, etc.). According to Philippe Ariès, mentality refers to 'currents of the deep' which govern, without them necessarily being aware of it, the most essential attitudes of men and women of the same period.

For other mentality historians, more directly located in the heritage of social history, the essential elements lie in the link between the differences between the ways of thinking and feeling and social differences. Such a perspective organizes the classification of mentality facts into divisions established by the analysis of society and then the superposition postulated as necessary between social boundaries that separate groups or classes and those which differentiate mentalities. This social cutting out is no doubt the most precise trace of the dependence of the 'history of mentalities' in relation to social history in French tradition. It was possible to understand it at a global and macroscopic level – and so in research aiming to characterize a mentality, a religion, or a 'popular' literature, opposed finally to that of the dominant or the elite – or in a more fragmented way, in reference to the hierarchy of conditions and professions. However, in both cases, the study of mental horizons reproduces the divisions proposed by the history of societies.

History of Mentalities or Historical Psychology?

Mentalities, sensitivities, visions of the world: the unstable plurality of vocabulary indicates, at the same time, both the difficulty in defining objects of a new historiographical approach and the will to link, in the same perspective, intellectual and psychological categories.

When Alphonse Dupront proposes, in 1960, at the International Congress of Historical Sciences at Stockholm, to constitute historical psychology as a whole discipline within human sciences, he gives it a maximal extension as it must be "the history of values, mentalities, forms, symbolics, myths." Such a definition reduced the distance established by the founders of *Annales* between mentality and ideas, as the latter participate fully in 'collective mentality' of men of a period. The ideas, perceived through the circulation of words which designate them, situated in their social rooting, considered in their affective and emotional load as much as in their intellectual content, therefore become, just like myths or values, one of those 'collective forces via which men live their time,' one of those elements which Dupront, in words borrowed from Jung, called 'collective psychic.' An expression exists there which, while claiming to be loyal to the project of the *Annales*, surpasses the old oppositions by giving a fundamental psychological definition of mentality and by reintroducing the ideas in the exploration of the collective mental.

Such a perspective (without the word 'mentality') appears in the work of Ignace Meyerson, whose importance, perhaps underestimated today, was central for the renewal of historical studies of antiquity – in particular his book *Les Fonctions psychologiques et les oeuvres* of 1948. A first relationship lies in the assertion of the fundamental historicity of mental categories and the psychological functions. It is this essential historicity of psychological objects which allows Meyerson to define it as a 'historical anthropology': "The psychological functions have a history and they have had different forms throughout this history. Time and memory have a history. Space has a history. Perception has a history. The person has a history." The work of historical psychology does not, therefore, consist of finding different modalities or expressions of functions considered as stable and universal. It attempts to understand, in their discontinuity and their singularity, the emergence and the economy of each of these functions. In this way, by applying the perspective of Meyerson to the question of the person in ancient Greece, Jean-Pierre Vernant writes: "There is not, there cannot be a model person, exterior throughout human history, with differences, variations according to places, transformations due to time. Research should therefore not establish if the person, in Greece, is or is not, but should research what the ancient Greek person is, how he is different, in the multiplicity of his features, of today's person" (see Vernant, 1965).

On the other hand, Ignace Meyerson radically modifies the location and comprehension of the mental and psychological categories. To their immediate, existentialist, phenomenological grasp, he opposes their knowledge based on symbolic forms, works, and acts in which they are objectivized. Analyzing psychological functions via productions (institutional, religious, legal, aesthetic, linguistic) allows for the rupture with the idea of universal and abstract men, and with the universalization of a particular form of the personality.

Success and Criticisms of the History of Mentalities

How can one explain the infatuation, of historians and readers, in France and outside of France, for the history of mentalities, whatever be the designation, in the 1970s and 1980s? No doubt because such an approach allowed for, in its very diversity, the introduction of a new balance between history and social sciences. Contested in its intellectual and institutional superiority by the development of psychology, sociology, and anthropology, history coped by annexing the topics of the discipline which questioned its domination. The focus then moved toward objects (systems of belief, collective attitudes, ritual forms, etc.) which, until then, belonged to the neighbors but which fully entered into the program of a history of collective mentalities.

Adapting to the approaches and analysis methods of socioeconomical history while transforming the historical questionnaire, the history of mentalities (in its widest definition) was able to occupy the front part of the historiographical scene and constitute an effective response to the challenge launched by social sciences.

However, there were many critics of its principles and methods. The first came from Italy. In 1970, Franco Venturi denounced the obliteration of the creative force of new ideas for the benefit of simple 'mental structures' 'lacking dynamism and originality' (see Venturi, 1970). Some years later, Carlo Ginzburg magnified the criticism (see Ginzburg, 1976). He refused the notion of 'mentality' for three reasons: first, for its exclusive insistence on 'elements which are inert, obscure, and unconscious of a determined vision of the world,' which lead to reducing the importance of rationally and consciously expressed ideas; second, for the 'interclass' character, which unduly assumes the sharing by the whole society of the same 'mental equipment'; and third, for the alliance with the

quantitative and serial approach, which, all together, reifies the contents of thought and attaches itself to the most repetitive expressions and ignores singularities. Historians were thus invited to privilege individual appropriations more than statistical distributions, to understand how an individual or a community interpreted, according to its own culture, ideas and beliefs, and texts and books circulating in their society.

In 1990, in the book with the provocative title, *Demystifying Mentalities*, Geoffrey Lloyd, historian of Greek philosophy and science, hardened the indictment once again. The criticism lies within the two essential principles of the 'history of mentalities': on the one hand, allocating to a whole society a stable and homogenous set of ideas and beliefs; on the other hand, considering that all thoughts and all conducts of an individual are governed by a unique mental structure. The two operations are the very condition allowing a mentality to be distinguished from another and permitting the identification within each individual of the mental tool shared with his contemporaries. However, such a way of thinking erases, in the repetitions of the collective, the originality of each singular expression and it encloses within an artificial coherence the plurality of belief systems and ways of reasoning that a same group or a same individual can successively mobilize.

Lloyd therefore proposed to substitute for the notion of 'mentality' that of 'styles of rationality' whose use depends directly on the contexts of discourse and the domains of experiences. Each of them lays down their own rules and conventions, defines a specific form of communication, and supposes particular expectations. This is why it is quite impossible to bring back the plurality of methods of thinking, knowing, and arguing to a homogenous and unique mentality.

The case was well pleaded but is it really justified? On the one hand, the history of mentalities did not only detain the single globalizing definition of the notion, as it inherited it from Lévy-Bruhl (1922), author of *La Mentalité primitive, ou des psychologues* (Charles Blondel, Jean Piaget, and Henri Wallon). If Lucien Febvre surely was tempted by the 'interclass' definition of mentality – in particular in *Le Problème de l'incroyance au XVIe siècle* – and Philippe Ariès after him, Marc Bloch and Robert Mandrou were very attentive to the social differences which command, in a same society, different ways of thinking and feeling, or diverse visions of the world.

On the other hand, French historians have not always ignored the possible presence, within the same individual, of several mentalities, distinct or even contradictory. Le Goff strongly expresses it: "The coexistence of several mentalities at a same time and in a same spirit is one of the delicate but essential elements of the history of mentalities. Louis XI, who, in politics, revealed a modern 'Machiavellian' mentality, in matters of religion revealed a very traditional superstitious mentality."

The critical examination of the contributions and limits of the 'history of mentalities' should neither reduce the diversity of it nor simplify the expressions of it.

From the History of Mentalities to Cultural History

The path of the history of mentalities is, therefore, made up of paradoxes. While it claimed to be clearly differentiated from other historical practices, it was never able to define clearly and unanimously its objects, methods, and concepts. It was during the years when it underwent the most criticism and when expression itself retreated for the benefit of other categories that the multiplication of works which explore the topics it designated were seen. It is no doubt due to the plasticity of its definition and the diversity of its uses that this history, omnipresent and inaccessible, was able to durably characterize a form of *historiographical* work. It is, therefore, no longer possible today, in a time when the notion of 'cultural history' has become dominant, even sometimes supreme. This is what must now be examined.

An Impossible Definition

The difficulty in defining cultural history lies fundamentally in the even larger difficulty in defining what the object 'culture' itself is. The innumerable meanings of the term can be diagrammatically distributed into two families of meaning: one which designates the works and gestures which, in a given society, avoid economical or symbolical urgencies of daily life and are submitted to an aesthetic or intellectual judgment, and one which aims at ordinary practices through which a community, whichever community it may be, lives and thinks out its relations to the world, to others, or to itself.

The first order of meanings leads to building the history of texts, works, and cultural practices like a history with two dimensions, as Schorske suggests: "The historian seeks to locate and interpret the artefact temporally in a field where two lines intersect. One line is vertical, or diachronic, by which he establishes the relation of a text or a system of thought to previous expressions in the same branch of cultural activity (painting, politics, etc). The other is horizontal, or synchronic; by it he assesses the relation of the content of the intellectual object to what is appearing in other branches or aspects of a culture at the same time" (Schorske, 1979). We must, therefore, consider each cultural production in the history of its genre, discipline, or field as well as in context of its relationships with the aesthetic or intellectual productions and the cultural practices which are contemporary to it.

The latter leads to the second family of definitions of culture. It strongly relies on the meaning that symbolical anthropology gives to notion – and in particular Geertz: "The culture concept to which I adhere […] denotes an historically transmitted pattern of meanings embodied in symbols, a system of inherited conceptions expressed in symbolic forms by means of which men communicate, perpetuate, and develop their knowledge about and attitudes towards life" (Geertz, 1973). It is, therefore, the entirety of languages and of the symbolical actions of a community which constitute its culture. From there, for historians, the attention is transferred to collective expressions where a cultural system is expressed in a paroxysmal way: rituals of violence, rituals of passages, carnivalesque festivals, etc. (Davis, 1975; Darnton, 1984).

What the different approaches try to consider today is the paradoxical articulation between a difference – the one by which all societies, in varying methods, separated a field characterized by particular experiences and delights – and subordination – those which make the aesthetic and

intellectual invention possible and intelligible by noting it in the social world and in the symbolical system particular to a time and a place.

Plurality of Practices, Common Questions

According to historiographical traditions and heritage, cultural history favored different objects, fields, and methods. Making an inventory of it is an impossible task – and partially futile as it would cause repetition of the assessments presented in the numerous articles of this encyclopedia. More significant, perhaps, is the pinpointing of the common questions to these very diverse approaches.

A first stake is the necessary articulation between singular works and common representations. There are several ways to conceive this: by concentrating on the particularities of each social space where works develop and circulate (guilds, the court, the academies, the market), by situating them in relation to texts and ordinary practices with which they are in 'negotiation' (to use a term which is dear to 'New Historicism'), or, using Elias's method, by understanding how aesthetic conventions refer to psychological economy and structure of personality in a time and a place.

A second question, very widely shared, lies in the relationships between popular and learned culture. The ways of perceiving them can be dealt with by using two large models of description and interpretation. The first, trying to abolish all forms of cultural ethnocentrism, treats popular culture as a coherent and independent symbolical system, which is organized according to irreducible to logic, that of well-read culture. The second, concerned remembering the existence of relationships of domination and inequalities of the social world, understands popular culture by its subordination and its weaknesses compared to the culture of the dominant. Therefore, on the one hand, popular culture is considered as a symbolical independent system, enclosed within itself, and on the other, it is entirely defined by its distance opposed to cultural legitimacy. For a long time, historians fluctuated between these two perspectives. Then, the work carried out on religion or literature treated as specifically popular and the construction of an opposition, repeated through time, between the golden age of a free and vigorous popular culture and the times of censorship and constraints which condemn it and dismantle it. Distinctions that are so clear are no longer accepted without doubts today, which leads us to consider all the mechanisms which cause internalization by the dominated to be of their own illegitimacy and expressions via which a dominated culture manages to save something of its symbolical coherence. The lesson is valuable for the confrontation between the elite and people in the old Europe (Ginzburg, 1966, 1976) and for the relationships between the dominated and the dominant in the colonial world (Gruzinski, 1988).

A final challenge for cultural history, whatever be the approaches and objects, lies in the articulation between practices and discourse. The questioning of ancient certainties took the form of a 'linguistic turn' which reposed on two essential ideas: (1) the language is a system of signs whose relationships themselves produce multiple and unstable meanings, beyond all intention or all subjective control; (2) 'reality' is not beyond discourse but is always built by discursive practices (Baker, 1990).

Opposed to such a position, numerous are the historians who, following the distinctions proposed by Foucault between 'discursive formations' and 'nondiscursive systems' (see Foucalt, 1969) or by Bourdieu between 'practical sense' and 'scholastic logic' (see Bourdieu, 1997), marked the difference between the logic of practices and that which governs the discursive production and which underlined the irreducibility between the reality which was (or is) and the discourse which intend to organize it, censure it, or represent it.

The fundamental object of a history attempting to recognize the way in which social actors give meaning to their practices and discourse is, therefore, found in the tension between the inventive capacities of individuals or communities and, on the other hand, the constraints and conventions which restrict – more or less tightly according to the position that they occupy in their domination relationships – what is possible for them to think, express, and do. The acknowledgment is valid for well-read works and aesthetic creations as well as for ordinary practices – which is another way of expressing the double definition of the objects of cultural history.

This article is a revision of the previous edition article by K. Takahashi, volume 5, pp. 3127–3130, © 2001, Elsevier Ltd.

Abstract

Individuals relate to others in ways that reflect the values, norms, beliefs, and practices of their cultures. This article provides an overview of research themes and findings on the role of culture in interpersonal relationships. This research is typically guided by theoretical frameworks focused on individualism (and independent selves), collectivism (and interdependent selves), or honor, and is also characterized by the use of multiple methodological approaches (e.g., emotional narratives, experiments, focus groups, surveys). The reviewed research reveals profound cultural differences in various aspects of interpersonal relationships, including beliefs about friends and enemies, relationship formation and dissolution, conflict, social support seeking, and the motivation to maintain a positive image in the eyes of close others.

Culture is a system of values, beliefs, norms, and practices that is shared and maintained by a group of individuals. Individuals form, develop, and dissolve relationships within the social contexts provided by their cultures. This cultural embeddedness of relationships implies that the ways individuals relate to other people reflect the shared values, beliefs, norms, and practices of their culture. Some cultures emphasize independence and autonomy, whereas other cultures emphasize connectedness and interdependence. Yet, other cultures value the protection of reputation and collective honor. Research in social and cultural psychology has systematically examined how culture shapes interpersonal relationships. This article identifies important research themes within the field of culture and interpersonal relationships and provides an overview of this research's most important findings.

Value Orientations and Models of Self and Relationships across Cultures

Research on culture and interpersonal relationships has typically compared individualistic and collectivistic cultures. Individualism and collectivism have been conceptualized as distinctive cultural value orientations (Hofstede, 2001; Kim et al., 1994). Although some of the earlier studies on culture measured individualism and collectivism as opposite ends of the same continuum, contemporary research generally treats them as independent value orientations. This methodological change is important as the latter approach provides a more complex and nuanced view of the influence of culture on interpersonal relationships. The implication of treating individualism and collectivism as opposite ends of the same continuum is that cultures can be either individualistic *or* collectivistic. However, aspects of individualism and collectivism can coexist within the same culture (Jansz, 1991). Individualism implies an independent model of self and relationships, whereas collectivism implies an *inter*dependent model of self and relationships. Independence and interdependence have been defined as distinctive sets of psychological tendencies to view oneself and one's social relationships (Markus and Kitayama, 1991). Cultural differences in independence and interdependence are conceptualized as relative, rather than absolute. In other words, the two models of self and relationships are not mutually exclusive. This means that individuals can endorse both cultural models as it is often the case with bicultural ethnic minorities (e.g., Latino as in the United States or Moroccan-Dutch in the Netherlands), or individuals who have been raised in both individualistic and collectivistic cultures.

Individuals who have a chronic interdependent self-concept (or interdependent selves) tend to define themselves in terms of their social roles (e.g., father, daughter, teacher) and relationships more than in terms of permanent and trans-situational traits (e.g., being extrovert or introvert). In contrast, individuals with a predominantly independent self-concept (or independent selves) tend to think of themselves as having distinct boundaries and traits that make them unique and different from other individuals. In addition, independence and interdependence involve distinctive motivational tendencies in interpersonal relationships (Markus and Kitayama, 1991; Heine and Butchel, 2009). In particular, independent selves are typically more motivated to maintain their individuality, autonomy, and uniqueness in relationships, whereas interdependent selves are typically more motivated to maintain connectedness, cooperation, and harmony in their relationships with others. Interestingly, a motivational emphasis on uniqueness among independent selves creates a psychological need for maintaining a positive view of the self in interpersonal relationships. For example, self-enhancement biases (e.g., engaging in downward comparisons to feel better about oneself) are more prevalent among independent than among interdependent selves. Interestingly, this cultural difference suggests that interdependent selves are likely to engage more freely in self-evaluation and self-improvement in interpersonal relationships.

Furthermore, there is an additional key difference in how independent and interdependent selves view interpersonal relationships. In particular, interdependent selves are more inclined to view relationships as ends in themselves. Thus, interdependent selves tend to have a more communal, collectivistic, or relational approach to interpersonal relationships compared to independent selves. For example, interdependent selves care more about preserving a good image in the eyes of others, being attentive to others' needs

and perspectives, and fulfilling social roles' expectations. In contrast, independent selves view relationships more as interpersonal spaces in which they can express their uniqueness and distinctiveness. As a consequence, independent selves view relationships as more transactional and less relational than interdependent selves.

Friendships and Culture

The Cultural Meaning of Friends and Enemies

Research by Adams and colleagues has revealed intriguing cultural differences in the meaning of friends and enemies. This research has compared European-American culture with Ghanaian culture. The former culture emphasizes individualism and an independent model of self and relationships, whereas the latter culture emphasizes collectivism and an interdependent model of self and relationships (Adams, 2005).

In one of their cross-cultural studies, Adams and Plaut (2003) interviewed European-American and Ghanaian student and nonstudent adults about friendship networks and the meaning of friends. Compared to Ghanaians, European-Americans reported a larger network of friends and emotional support as a key feature of friendships. Interestingly, Ghanaians more often reported that having too many friends could be problematic because friendships have both advantages and disadvantages. For example, Ghanaian participants more often reported that friends might reveal secrets or damage one's reputation. Taken together, these findings reveal three profound differences in the cultural meaning of friendships. First, European-Americans' larger friendship networks and Ghanaians' greater emphasis on the negative side of friendships suggest that European-Americans viewed friendships as less taxing and as involving less interpersonal obligations than Ghanaians did. Second, European-Americans' greater emphasis on emotional support suggests that they valued self-disclosure and self-expression in friendships more than Ghanaians did. Third, Ghanaians' greater emphasis on potential betrayals (e.g., friends revealing secrets) suggests that friends who may want to harm the self are a part of one's social network in Ghanaian culture. This cultural difference motivated Adam and colleagues' research on *enemyship* in interpersonal relationships.

Enemyship is defined by Adams (2005) as an interpersonal relationship marked by hatred and malice. In three studies using multiple methods, Adams (2005) showed that cultural differences in the relational proximity of enemies are grounded in independent and interdependent models of self and relationships. In the first study, Ghanaian and European-American nonstudent and student adults were interviewed about their conceptions of enemyship. Compared to European-American participants, Ghanaian participants reported having more enemies and being more often the target of enemyship. Moreover, Ghanaians described a person who claims to have no enemies as naïve, whereas European-Americans described a person who is suspicious about having enemies as abnormal (e.g., the person may be 'paranoid'). In addition, European-Americans more frequently mentioned that a person could *choose* whether they have enemies or not. These results were replicated in a second study using a survey methodology. In addition, a third experimental study among Ghanaian students examined the cause of Ghanaians' conception of enemyship. This study showed that Ghanaians' enemyship beliefs are based on an interdependent model that views enemies as an unavoidable aspect of interpersonal relationships.

Choice and Friendships: On Relational Mobility

The studies by Adams and colleagues (Adams, 2005; Adams and Plaut, 2003) showed that cultures differ in beliefs about choice in interpersonal relationships (e.g., how much a person can choose friends or enemies). These cultural differences have important implications for how interpersonal relationships are formed and dissolved. Research on relational mobility has examined the formation and dissolution of friendships across cultures.

Relational mobility has been defined as the number of available opportunities to form new relationships in a particular society (Schug et al., 2010). Research on relational mobility has typically examined differences between Japan and the US. Although US society is ethnically and culturally diverse, research on relational mobility has typically made predictions about relationship formation for US society as a whole, and not for specific cultural or ethnic groups within the United States (e.g., European-Americans, African-Americans, Latina/os). However, the majority of US participants in relational mobility studies are of European-American descent (Schug et al., 2009, 2010). US society is typically described as high on relational mobility due to its emphasis on an independent model of self and relationships. This cultural model facilitates the dissolution of friendships and the formation of new friendships because of its emphasis on personal choice. In contrast, Japanese society's emphasis on an interdependent model of self and relationships implies that individuals see friendships as more binding. Although relational mobility has been conceptualized as a characteristic of societies' social networks (i.e., number of available opportunities), it is typically measured as an individual difference variable, i.e., as the extent to which individuals *perceive* that their environment offers them opportunities to form new relationships (i.e., relational mobility scale by Schug et al., 2009).

Schug and colleagues have tested these predictions in several studies with Japanese and US student samples. For example, one study showed that US participants rated the similarity between themselves and their closest friend higher than Japanese participants did. Moreover, US participants also scored higher on relational mobility. In addition, the cultural difference in ratings of self–friend similarity was explained by cultural differences in relational mobility. In other words, US participants perceived a greater self–friend similarity than Japanese participants did because they believed that their society offers them more opportunities to form new relationships. According to Schug et al. (2009), this finding implies that US participants were able to choose friends who are more similar to them because their society is high on relational mobility. Although both Japanese and US participants preferred to have friends who are similar to them, Japanese participants could not realize their preference due to their society's low relational mobility.

In other studies, Schug et al. (2010) examined the relationship between relational mobility and self-disclosure in interpersonal relationships. Although there were no cultural differences in self-disclosure to family members, US participants reported disclosing vulnerable information about the self to friends (e.g., revealing one's greatest worry or secrets) more often than Japanese participants did. Furthermore, greater self-disclosure in friendships was positively associated with perceptions of high relational mobility in one's immediate environment (e.g., neighborhood, school). Moreover, these studies found that US participants – who perceived higher relational mobility in their immediate environments – self-disclosed more to friends because they believed that sharing vulnerable information about themselves would strengthen their friendships.

In sum, societal differences in relational mobility translate into differences in relationship formation and dissolution. In high-relational-mobility societies, friendships are seen as reflecting personal choice and individuals dissolve and form friendships more easily than in low-relational-mobility societies. According to Yuki and Schug (2012), friendships are more fragile in high-relational-mobility societies, which explains the strengthening function of self-disclosure to friends in this type of society. In low-relational-mobility societies, friendships are more stable and firmly embedded in individuals' social networks, which suggests fewer opportunities to form new friendships.

Face in Interpersonal Relationships across Cultures

Psychological research on face and culture is based on Ervin Goffman's seminal work on face (Goffman, 1959, 1967). Goffman was particularly interested in individuals' behavior when they "enter the presence of others" (Goffman, 1959: p. 1). Goffman defined face as how individuals want others to think of them in social interactions. When interacting with others, individuals typically want to maintain a positive face and one that is in line with the personal attributes that are valued in their culture. Face is therefore located in the moment-to-moment interactions between two or more individuals. This implies that face is an emergent and dynamic process in interpersonal relationships as the face that one wants to create, maintain, or protect may change across relationships (Goffman, 1959, 1967).

Importantly, Goffman did not conceptualize the maintenance or protection of face simply as a strategic form of impression management. On the contrary, individuals are attached to the face they wish to maintain or protect. For this reason, facework is necessary to prevent face loss. Goffman defined facework as an individual's verbal and nonverbal behaviors aimed at maintaining or protecting a particular face in a social interaction. According to Goffman, there are two facework orientations or perspectives: a *defensive* orientation focused on the protection of one's face and a *protective* orientation focused on the protection of another person's face. Although some interactions may be dominated by one of the two perspectives, Goffman expected individuals to often take both perspectives simultaneously in their social interactions. In cultural psychology, research based on Goffman's conceptualization of face has examined (1) the factors that affect the perception of face threats and (2) the face in the context of interpersonal conflict.

Threats to Face

The work by Lin and Yamaguchi most clearly follows Goffman's conceptualization of face as an emerging process of social interactions. Indeed, Lin and Yamaguchi defined face as the positive impressions that individuals want to "claim, maintain, or enhance in the presence of others" (2011a: p. 120). Their work provides an in-depth examination of the Japanese indigenous concept of '*mentsu*,' which can be translated as an individual's 'social images in public' (2011a: p. 121). For example, Lin and Yamaguchi recently examined the factors that influence individuals' perception of threats to '*mentsu*' (2011a). A first study among nonstudent and student adults collected 226 descriptions of threats to '*mentsu*.' Interestingly, 97.35% of the participants' narratives referred to others being present in the situations that threaten '*mentsu*.' In addition, 50.44% of the narratives also referred to the participants' failure to live up to social roles' expectations, this category being especially frequent in nonstudent adults' descriptions.

These results were replicated in a second experimental study that manipulated social role salience and publicity in a series of vignettes depicting threats to '*mentsu*.' In particular, a sample of Japanese nonstudent adults reported that the vignettes' protagonist would feel more face loss (1) in public situations and (2) in situations where the protagonist violated social role expectations. Taken together, these findings support Goffman's definition of face as a consequence of social interactions (i.e., public situations). Additionally, these studies show that face is strongly tied to social roles – an idea already advanced by Goffman (1967) – and suggest that this association becomes stronger or more important as individuals get older and acquire more social roles (e.g., when individuals enter the work force).

Furthermore, Lin and Yamaguchi have also examined the emotional consequences of face threats to self and others. In a diary study, they asked Japanese nonstudent adults to answer questions about events related to one's or others' face twice a week during a 10-week period (Lin and Yamaguchi, 2011b). Participants were asked to report how much their own and/or others' face was lost or maintained. Additionally, participants completed a measure of how they generally felt on the days they completed the survey (e.g., happy, upset). Lin and Yamaguchi (2011b) found that the maintenance of one's face in everyday social interactions was associated with more intense joy, increased self-esteem, and less intense feelings of depressiveness. What's more, participants also experienced increased joy when others' face was maintained in their everyday social interactions. Thus, individuals can care about the protection of others' face as much as they care about the protection of their own face.

In a cross-cultural study among Hong Kong Chinese and a diverse sample of US student adults, Liao and Bond (2011) examined the role of power distance in face threat perception (or face loss). Power distance is a cultural value orientation that refers to the extent to which hierarchy and power differences are accepted in a particular culture (Hofstede,

2001). Liao and Bond (2011) proposed that power distance shapes the meaning of perceived power differences in interpersonal relationships. In high-power-distance cultures, power in interpersonal relationships is likely to refer mainly to one's position and associated social role expectations in a relationship. By contrast, in low-power-distance cultures, power is more likely to be seen as reflecting each partner's agency and control in the relationship. These predictions were examined by asking participants to recall an event in which they were harmed by another person with whom they had an ongoing relationship (e.g., a friend). As expected, perceptions of relationship power played a different role in face loss among Hong Kong Chinese and US participants. In particular, US participants associated face loss with a perceived loss of power in the relationship with the person who harmed them to a greater extent than Hong Kong Chinese participants did. Hong Kong Chinese participants, in contrast, associated face loss with a perceived norm violation by the person who harmed them (i.e., this person did not act in accordance with what is expected of them) to a greater extent than US participants did. Thus, the cross-cultural study by Liao and Bond (2011) shows that the antecedents of face threat perception vary across cultures.

Face in Interpersonal Conflict

Research by Ting-Toomey, Oetzel, and colleagues has examined face loss in the context of interpersonal conflict. Based on the work by Goffman (1959, 1967), Ting-Toomey and colleagues developed face negotiation theory (Ting-Toomey and Oetzel, 2001). Although face negotiation theory distinguishes between concerns for one's face, others' face, and mutual face (i.e., a concern for protecting one's and others' face simultaneously, or the face of a relationship), the majority of research on face and conflict has focused to date on a concern for one's and others' face. Empirical studies based on face negotiation theory have typically examined face concerns and facework behavior in the context of autobiographically recalled experiences of interpersonal conflict, or in response to scenarios depicting interpersonal conflict situations with another person of the same biological sex and cultural background as the participant. On the basis of these studies, Oetzel, Ting-Toomey, and colleagues have identified 13 different types of facework behaviors that can be grouped into three types of conflict management styles: dominating (e.g., aggression, defend), integrating (e.g., apologize, respect, private discussion), and avoiding (e.g., avoid, pretend; Oetzel et al., 2000).

Furthermore, face negotiation research has shown that the intensity of a concern for one's face or others' face varies across individualistic and collectivistic cultures. In particular, a concern with the protection of one's face in interpersonal conflict has shown to be more intense among individualistic student adult samples (e.g., US participants, Germans), whereas a concern with the protection of others' face in interpersonal conflict has shown to be more intense among collectivistic student adult samples (e.g., Japanese, Chinese participants; Oetzel et al., 2008). Moreover, Ting-Toomey, Oetzel, and colleagues have also examined the role of face concerns and facework in conflicts with different relationship partners. For instance, Oetzel et al. (2003) examined the role of face concerns and facework in interpersonal conflicts with parents or siblings. Student adult samples from Germany, Japan, Mexico, and the United States (a diverse sample that included European-Americans, Latino/as, African-Americans, Asian-Americans, and Native Americans) were asked to recall a conflict with either a same sex parent or a same sex sibling. Interestingly, participants reported using different facework behaviors in conflicts with parents or siblings. Participants who described conflicts with a parent reported being more likely to be respectful and less likely to use aggression, pretense, and third party compared to participants who reported conflicts with siblings. In addition, this study showed that an independent self-concept was positively associated with a concern with one's face and dominating facework behavior whereas an interdependent self-concept was positively associated with a concern for others' face and integrating and avoiding facework behavior in conflicts with both parents and siblings.

The Cultural Meanings of Social Support

A concern for face has also been examined in the context of social support seeking in interpersonal relationships. This research, however, has not given a central place to face but has rather examined face as one of the variables that can explain cultural differences in *explicit* social support seeking. Explicit social support seeking refers to explicitly asking for advice, emotional comfort, or practical help when dealing with a stressor (Kim et al., 2008).

In a key series of studies, Kim and colleagues manipulated a focus on relationships versus a focus on the self to examine its effects on explicit social support seeking (Kim et al., 2006). Asian-American and European-American student adults were randomly allocated to a self-goals, in-group, out-group, or control condition. In-group and out-group were treated as proxies for close and distant relationships, respectively (Study 2; Kim et al., 2006). Depending on the condition, participants were asked to write about their goals, or the goals of an in-group or out-group. In addition, participants described the most important stressor they were facing and completed measures of coping strategies and expectations of a successful resolution of the stressor. The findings are intriguing. European-Americans sought social support and believed they would be successful in dealing with the stressor to the same extent across conditions. In contrast, Asian-Americans primed with in-group goals sought social support *less* and believed they would be less successful in dealing with the stressor than their counterparts in the self-goals and out-group conditions. A third experimental study replicated these findings and sought to explain these cultural differences. This third study also included a Latino/a student adult sample (Study 3; Kim et al., 2006). Importantly, this study showed that Latina/o and Asian-American participants sought social support less because they were more concerned than European-American participants were about the potential negative effects of seeking social support for their interpersonal relationships. For example, Latino/a and Asian-American participants reported a stronger motivation to

avoid face loss and preserve group harmony. Taken together, these findings indicate that explicit social support seeking has a more negative meaning in interpersonal relationships in collectivistic than in individualistic cultures.

Given the multiple benefits of social support (e.g., faster recovery from health problems, Kim et al., 2008), Taylor and colleagues have also examined the effectiveness of *implicit* social support seeking in collectivistic cultures. In a study among Asian-American and European-American student adults, they compared the effectiveness of explicit vs implicit social support in response to a stressful experimental task (e.g., arithmetic and preparation of a speech; Taylor et al., 2007). The implicit support prime consisted of writing about a group of people the participants felt close to, whereas the explicit support prime consisted of writing a letter to close others asking for advice and support for the stressful tasks. As expected, Asian-Americans in the implicit prime condition experienced less stress (as measured by self-report and cortisol levels) than their counterparts in the explicit prime condition. The reverse pattern of results was found for European-Americans. Thus, thinking about one's close relationships is psychologically and physiologically more beneficial than explicitly asking for support among Asian-Americans. These results therefore suggest that implicit social support seeking has a more positive meaning in interpersonal relationships in collectivistic than in individualistic cultures.

A study by Chang extends research on the cultural meaning of social support by examining differences *between* collectivistic cultures (Chang, 2014). Understanding how social support may be practiced differently in different collectivistic cultures is key to the development of theory on different forms of collectivism. Chang's work focuses on two specific forms of collectivism: familism and filial piety. Familism is a Latino/a value that emphasizes emotional closeness, joint decision making within the family, and loyalty toward family members. Filial piety is especially important among Asian-Americans. Caring and respecting one's elders and the protection of face are key cultural values associated with filial piety. On the basis of these different forms of collectivism, Chang (2014) advanced that self-disclosure of emotional distress may be seen as equally negative among Latino/as and Asian-Americans, but for different reasons. Asian-Americans may see self-disclosure as potentially leading to face loss as family members – especially elders – may form a negative impression of the self. In contrast, self-disclosure among Latino/as may be seen as being emotionally taxing for family members. Chang examined these hypotheses in a qualitative study using focus groups among Latina/o and Asian-American student adults.

In each focus group, the participants were asked to describe several topics related to social support (e.g., who they asked for social support when facing stressors; preferred coping strategies). Results revealed cultural similarities as well as culture-specific patterns of stressors and social support seeking. In terms of cultural similarities, academic problems were the most frequently mentioned stressors by all participants. With regards to cultural differences, both Asian-Americans and Latino/as preferred to be self-reliant than share problems with close others, but for different reasons. Asian-Americans indicated that they wanted to be self-reliant because of being worried about face loss, in particular, giving the impression of being weak and not capable of dealing with problems. Consistent with this finding, Asian-American participants also mentioned that their parents would expect them to show emotional restraint and endurance when dealing with stressors more frequently than Latina/o participants did. In contrast, Latina/o participants reported being self-reliant in the face of stressors because they wanted to maintain harmony and minimize worry within the family. Furthermore, Latina/o participants explicitly mentioned the protection of their family's honor as a reason for their self-reliance (i.e., not disclosing something about the self that may negatively affect the family's collective reputation). Chang's research demonstrates that the in-depth study of specific forms of collectivism provides a more comprehensive and nuanced view of how collectivism and interdependence are practiced in interpersonal relationships.

Honor in Interpersonal Relationships

Honor cultures represent a particular form of collectivism (Triandis, 1989) and are characterized by the existence of honor codes, which include values and norms about appropriate behavior in interpersonal relationships (Rodriguez Mosquera et al., 2012). In honor cultures, an individual has honor when she or he is *known by others* as behaving in accordance with the values and norms of four honor codes: morality-based honor, family honor, masculine honor, and feminine honor (Rodriguez Mosquera et al., 2012). Thus, reputation is a core concern in interpersonal relationships in honor cultures. Morality-based honor and family honor are important for both men's and women's honor, whereas feminine and masculine honor are gender-specific honor codes. Morality-based honor is about maintaining a reputation for being honest and trustworthy in interpersonal relationships. Family honor is about protecting the reputation of one's family. Masculine honor is about maintaining a reputation for being though and strong in interpersonal relationships. Feminine honor is about being known as having sexual propriety (e.g., chastity, modesty). Thus, honor is complex and multifaceted.

Research on honor in cultural and social psychology has shown honor to be important in a wide variety of sociopsychological processes (e.g., in-group relations, sexuality and gender, morality), and has also examined honor across a wide range of countries and cultures (e.g., Afghanistan, Brazil, Finland, Italy, Japan, New Zealand, Russia, United Kingdom; see Rodriguez Mosquera, 2013). In the context of interpersonal relationships, research on honor has mainly focused on the emotional and relational consequences of (threats to) reputation. For example, Cohen and colleagues have examined the protection of masculine honor in interpersonal relationships among White, non-Hispanic males from Southern and Northern regions of the United States. In a series of three experiments, Cohen and colleagues measured how White, non-Hispanic Southern and Northern male student adults responded to being insulted (or not) by a male confederate (Cohen et al., 1996). Results showed that Southern males were more reactive to insults than Northern

males were. In particular, observers rated Southern male participants as more angry and Northern male participants as more amused after being insulted (Study 1; Cohen et al., 1996). Furthermore, Southern male participants were more stressed (as shown by higher cortisol levels) and more prepared for aggression (as shown by increases in testosterone levels) than Northern male participants were after being insulted (Study 2; Cohen et al., 1996). Moreover, Southern males believed to a greater extent than Northern males did that their masculine honor (i.e., their reputation as manly, strong, and tough) was damaged after being insulted (Study 3; Cohen et al., 1996). In other studies, Cohen and colleagues have used other methods (e.g., archival data, survey research) to examine masculine honor's consequences in Southern US culture (for an overview, see Nisbett and Cohen, 1996).

Cohen and colleagues' research has shown masculine honor to have negative effects on interpersonal relationships in Southern US white, non-Hispanic male culture because of its potential association with male aggression and dominance. However, the maintenance of honor among men is not necessarily associated with aggression or dominance in social relationships. Indeed, Mandel and Litt's research has shown that men's behavior in relationships can also be motivated by morality-based honor. Mandel and Litt (2013) studied the relational consequences of honor among a large sample of mostly male Canadian Force members. The participants in this study rated their peers across different ranks on attributes that reflect morality-based honor, for example, integrity, dignity, and loyalty. Interestingly, high-ranking military members were rated as *less* honorable than lower ranking military members were by both low- and high-ranking participants. This result indicates that having high status does not necessarily translate into being seen as honorable in interpersonal relationships. Most importantly, the more the male participants perceived their peers as honorable, the more connected they felt with other members of their group and the more willing they were to engage in *helping behavior*. Thus, the maintenance of honor among men has different interpersonal consequences in different contexts and cultures.

A different line of research on honor in interpersonal relationships has compared emotional and behavioral responses to devaluation across cultures. Rodriguez Mosquera and colleagues collected 149 narratives about insults in interpersonal relationships in a field study among Moroccan-Dutch, Turkish-Dutch, and ethnic Dutch student and nonstudent adults (Rodriguez Mosquera et al., 2008). The protection of honor was more important for Moroccan- and Turkish-Dutch than for ethnic Dutch. Importantly, there were no cultural differences in the types of insult reported by participants (i.e., all cultural groups reported insults to one's competence, or insults to one's place in relationships), or in the person who delivered the insult (all cultural groups reported insults delivered by close others like friends or family members).

Furthermore, there were no cultural differences in feelings of anger about being insulted. In addition, feelings of anger were associated with a motivation to punish the close other who delivered the insult through verbal attack (e.g., criticizing) for all cultural groups. Interestingly, however, cultural differences emerged in the behaviors and motivations associated with feelings of shame. Shame was associated with social withdrawal among ethnic Dutch, whereas it was associated with verbal disapproval of the close other's behavior among Turkish- and Moroccan-Dutch. Most importantly, the study showed that Turkish- and Moroccan-Dutch used verbal disapproval as an attempt to restore a positive reputation (i.e., restore their honor) in their interpersonal relationships (for an overview of other studies on threats to reputation, see Rodriguez Mosquera et al., 2012). Furthermore, this heightened concern for reputation in honor cultures also influences the experience of positive emotions. In particular, the perception that one has a positive reputation in interpersonal relationships has been shown to be associated with increased well-being among honor-oriented Indian, Pakistani, and Bangladeshi student adults, but not among less honor-oriented White British and European-American student adults (Rodriguez Mosquera and Imada, 2013).

Further, two recent studies have revealed that members of honor cultures are also concerned about protecting the reputation of their families in interpersonal relationships. Rodriguez Mosquera et al. (2014) carried out two experimental studies among Pakistani and European-American student adults on emotional and behavioral responses to insults to one's family. Family honor creates a distinctive type of interdependence in interpersonal relationships, one based on shared social image. This type of interdependence implies that individual family members are responsible for protecting the family from potential threats, like insults. In line with their greater emphasis on the protection of family honor, Pakistani participants experienced more intense anger, shame, negative feelings about themselves, and worry about their reputation than European-American participants did in response to an insult to their families. Moreover, Pakistani participants reported that they distanced themselves *from a family member* who insulted the family more than European-American participants did (these cultural differences did not emerge when the person who delivered the insult was not a family member, e.g., a friend). This finding is important as it shows the profound effects that threats to family honor can have on close relationships.

In sum, honor is shared, negotiated, challenged, and maintained in interpersonal relationships. Due to this relational nature, honor is a powerful force in our relationships with others. For example, the reviewed studies show that those who value honor care deeply about their relatives' willingness to protect the family's honor, or about how friends think of them. Moreover, honor can strengthen interpersonal bonds and increase individuals' willingness to help others when relationship partners perceive each other as honorable.

Conclusions

The ways in which individuals relate to other people are grounded in culture. Relationships exist within the contexts and meanings provided by culture. The research reviewed in this article has revealed a great deal of cultural diversity in interpersonal relationships. Cultures differ, for example, in the size of friendship networks, beliefs about what makes a good friend, concerns and behaviors involved in interpersonal

conflict, relationship formation and dissolution, social support seeking, or the role of honor and reputation in relationships. Furthermore, the research reviewed in this article has used a variety of theoretical and methodological approaches – surveys, focus groups, (field) experiments, emotional narratives, diary studies – to examine the depth and breadth of culture's influences on interpersonal relationships. Furthermore, several different cultures have been included in this research. Yet, there are cultures that are still understudied in cross-cultural research on interpersonal relationships. The future of research on culture and interpersonal relationships lies in expanding its theories and methods to include these understudied cultures. Understanding cultural diversity in interpersonal relationships and other sociopsychological processes is key to the advancement of psychology as an inclusive discipline.

Cultural Intelligence and Competencies

Soon Ang, Thomas Rockstuhl, and Mei Ling Tan, Nanyang Technological University, Singapore

Abstract

With the continuing globalization of the workplace, it is critical to understand why some people excel in intercultural contexts whereas others do not. Cultural intelligence is a person's capability to function effectively in intercultural contexts. In this article, we take stock of the growing stream of research on cultural intelligence. In particular, we review the conceptualization, measurement, and empirical evidence for the nomological network of cultural intelligence. We conclude with an eye toward the future and suggest several exciting research directions to further advance our understanding of cultural intelligence.

Theoretical Conceptualization of Cultural Intelligence

Definition

Cultural intelligence (CQ) refers to a person's capability to function effectively in culturally diverse contexts (Ang and Van Dyne, 2008; Earley and Ang, 2003). This definition of cultural intelligence as a capability emphasizes a person's potential to be effective across a wide range of intercultural contexts. Cultural intelligence differs from the capability to function effectively in a specific culture. Instead, cultural intelligence reflects a general set of capabilities that facilitate one's effectiveness across different cultural environments. In this sense, cultural intelligence is culture-free.

Cultural intelligence also differs from cross-cultural views of intelligence that emphasize the relativity of intelligence definitions depending on particular cultural and ecological contexts (Berry, 1976; Sternberg, 2004). For example, hunter-gatherers require different intelligences than agriculturalists to survive in their respective ecological environments. Therefore, the meaning of intelligence varies in each culture depending on its unique ecological context. While cultural intelligence does not refer to these culturally bound notions of intelligence, knowledge of such culturally bound views of intelligence does reflect high-cultural intelligence (specifically, cognitive cultural intelligence, as we will describe below).

Cultural Intelligence as a Multidimensional Intelligence

The conceptualization of cultural intelligence draws upon the rich history of intelligence research. Cultural intelligence builds on insights from intelligence research suggesting that intelligence is multifaceted. Integrating myriad views on intelligence, Sternberg and Detterman (1986) proposed that intelligence resides in different loci within an individual: the biology, the cognition (including metacognition), the motivation, and the behaviors.

The cultural intelligence model (Earley and Ang, 2003) draws on Sternberg and Detterman's (1986) multiple-loci conceptualization of intelligence and comprises four factors: (1) metacognitive cultural intelligence, which reflects an individual's mental capability to acquire and understand cultural knowledge; (2) cognitive cultural intelligence, which reflects an individual's knowledge about cultures and cultural differences; (3) motivational cultural intelligence, which reflects an individual's capability to direct and sustain effort toward functioning in intercultural situations; and (4) behavioral cultural intelligence, which reflects an individual's capability for behavioral flexibility in cross-cultural interactions. While the initial conceptualization of cultural intelligence did not include biological aspects of intelligence, recent work on cultural intelligence has embraced biological foundations of cultural intelligence (Rockstuhl et al., 2010).

Cultural Intelligence and Other Forms of Intelligences

Cultural intelligence is similar to social and emotional intelligence in that cultural intelligence is a form of interpersonal intelligence. Social intelligence is a broader form of interpersonal or real-world intelligence that refers to the ability to understand and manage others. Emotional intelligence refers more specifically to the ability to deal with emotions of self and others. Cultural intelligence shares similarities with social and emotional intelligence in that cultural intelligence includes the abilities to understand and manage others, as well as to deal with their emotions. However, unlike social and emotional intelligence, cultural intelligence explicitly considers the intercultural context. Understanding culturally different others requires a distinct set of abilities because of cultural variations in how people from different parts of the world express themselves verbally and nonverbally. Hence, a person who is high in emotional intelligence or social intelligence is not necessarily high in cultural intelligence. Empirical studies have shown cultural intelligence to be distinct from emotional and social intelligence. Across multiple studies (for details, see Ang et al., in press), confirmatory factor analyses showed discriminant validity between cultural intelligence and emotional intelligence – correlations between cultural intelligence and emotional intelligence ranged from 0.26 (Ang et al., 2007) to 0.82 (Ward et al., 2009). In addition, one study found cultural intelligence to be discriminant from social intelligence, with the correlation between the two constructs at 0.42 (Crowne, 2009).

Cultural intelligence is also similar to but distinct from general cognitive ability. General cognitive ability is a key predictor of performance across jobs and settings. Similarly, cultural intelligence should predict performance but more specifically in intercultural contexts (Ang and Van Dyne, 2008).

Cultural intelligence is also distinct from general cognitive ability because the latter only includes the cognitive locus of intelligence and excludes the motivational, behavioral, and biological loci. Empirical studies show negative correlations between motivational cultural intelligence and general cognitive ability, and weak correlations ranging from 0.00 to 0.11 for the other three factors of cultural intelligence (Ang et al., 2007; Ward et al., 2009). Empirical evidence also indicates that cultural intelligence has a stronger correlation with task performance in intercultural contexts than does general cognitive ability. Hence, cultural intelligence incrementally predicts performance in intercultural situations beyond cognitive ability (Ang et al., 2007; Rockstuhl et al., 2011).

Cultural Intelligence and Personality Traits

Personality traits refer to stable personal characteristics that lead to consistent patterns of cross-situational behavior (Costa and McCrae, 1992). By contrast, cultural intelligence is a set of capabilities that determine what a person is capable of doing to be effective in culturally diverse settings. Hence, personality traits and cultural intelligence are conceptually distinct. However, given that personality traits affect a person's choice of behaviors and experiences, some personality traits might relate to cultural intelligence. In line with these conceptualizations, Ang et al. (2006) demonstrated discriminant validity between the four factors of cultural intelligence and the Big-Five personality traits. We will elaborate this point below (see Section on Antecedents of Cultural Intelligence).

Cultural Intelligence and Other Cultural Competencies

Cultural competencies are an umbrella term for concepts related to intercultural effectiveness. In a recent review of cultural competence models, Leung et al. (2014) identified more than 30 cultural competence models with over 300 concepts related to cultural competence. These 300 concepts cover a broad range of personal characteristics including intercultural personality traits, intercultural attitudes and worldviews, or intercultural capabilities. Intercultural personality traits describe what a person typically does in intercultural contexts. Examples include tolerance for ambiguity or cultural empathy. Intercultural attitudes and worldviews refer to how a person perceives and evaluates experiences with other cultures. Examples include ethnocentrism or ethnorelativism. Intercultural capabilities describe what a person can do to be effective in intercultural contexts. Examples of intercultural capabilities include self-awareness or global business savvy.

Cultural competence models differ in scope. Some models combine personality traits, attitudes and worldviews, and capabilities. Other models focus on unique domains of characteristics. For example, the cultural intelligence model concerns intercultural capabilities only, while the Global Mindset Inventory (Javidan and Teagarden, 2011) embraces personality traits, attitudes and worldviews, as well as capabilities (see Leung et al., 2014).

The range and scope of different content domains covered by cultural competence models raise questions about the structural relationships between these content domains. Theories of job performance suggest that distal constructs such as personality traits and attitudes exert their effects on job performance via more proximal capabilities (Campbell et al., 1993). Hence, intercultural capabilities are more proximal predictors of performance in intercultural contexts and mediate effects of intercultural personality traits and intercultural attitudes and worldviews.

Therefore, we focus on capability models and the cultural intelligence model in particular, for the remainder of this article. We highlight the cultural intelligence model as a theoretically coherent and parsimonious framework of intercultural capabilities. Based on the multiple-loci conceptualization of intelligence, the concept of cultural intelligence is theoretically precise about what is and is not part of its construct space. The cultural intelligence concept is parsimonious in that it focuses on only four abstract factors (e.g., metacognition) rather than a vast number of narrower dimensions (e.g., self-awareness, cognitive complexity, cognitive flexibility, perspective taking, planning, checking). Capabilities from other cultural competence models can be mapped onto the cultural intelligence model. However, other cultural competence models rarely consider all four factors simultaneously and thus lack the comprehensiveness offered by the cultural intelligence model for describing the capabilities domain.

Measurement of Cultural Intelligence

Individual differences in cultural intelligence are measured using diverse methods. These methods include self-reports, observer-reports, and performance-based measures.

Self-Reports of Cultural Intelligence

Self-reported measures of cultural intelligence present respondents with a list of statements relevant to multiple dimensions of cultural intelligence (e.g., "I check the accuracy of my cultural knowledge as I interact with people from different cultures"). Respondents then rate the extent of their agreement with each statement. As a measure of perceived capability, self-reported measures of cultural intelligence reflect one's self-efficacy in cultural intelligence.

To date, most empirical research uses the 20-item four-factor Cultural Intelligence Scale (CQS) introduced by Ang et al. (2007). Van de Vijver and Leung (2009) advise that measures for use in intercultural contexts should demonstrate both factor structure validity and cross-cultural measurement equivalence. The Cultural Intelligence Scale meets both criteria. Its four-factor structure generalizes across (1) multiple student and executive samples; (2) repeated measurements using time intervals of up to 4 months; (3) multiple countries, including South Korea, Switzerland, Singapore, Turkey, and the United States; (4) culturally diverse samples; or (5) members in multicultural teams (see Leung et al., 2014).

Observer-Reports of Cultural Intelligence

Observer-reports of cultural intelligence are a fundamental source of information about a person's external manifestation of cultural intelligence and reflect a person's cultural intelligence reputation. In observer-reports, acquaintances (e.g., friends,

peers, supervisors, subordinates) summarize their perceptions of someone's cultural intelligence reputation.

Van Dyne et al. (2008) developed an observer-reported measure of cultural intelligence based on the 20-item Cultural Intelligence Scale. In an initial validation study with 142 executive MBAs, these authors found evidence for the convergent validity between self-reported and observer-reported cultural intelligence. Kim and Van Dyne (2012) further supported the predictive validity of observer-reports of cultural intelligence. In a sample of 181 working adults, observer-reports of cultural intelligence from one group of observers predicted international leadership potential as rated by another group of observers.

Performance-Based Assessment of Cultural Intelligence

Ang et al. (2014a) introduced an intercultural situational judgment test (iSJT) to measure cultural intelligence. This test presents respondents with multimedia vignettes of challenging work-related intercultural situations and asks them how they would respond to that situation. Responses are then scored in terms of how effective they resolve the situation in the vignette. The primary appeal of using multimedia over text-based vignettes lies in their greater fidelity (i.e., correspondence to real situations) due to richer portrayals of detailed cultural information (e.g., nonverbal gestures). Rockstuhl et al. (2013b) showed that the iSJT predicted supervisor-rated task performance for offshoring professionals from the Philippines. In a related study, Rockstuhl et al. (2014) showed that the iSJT predicted peer-rated task performance and interpersonal organizational citizenship behavior (OCB) in multicultural teams.

Combining Complementary Measures of Cultural Intelligence

We suggest that different measures of cultural intelligence provide complementary information. In particular, divergence between different measures of the same construct more likely reflects different but theoretically meaningful aspects of a construct (i.e., self-efficacy for self-reports vs reputation for observer-reports) instead of mere bias.

If different measures of the same construct reflect theoretically meaningful aspects instead of bias, then different measures should predict outcomes incrementally over and above each other. Research shows consistently that self-reports predict performance over and above alternative measures of the same construct. For example, in the domain of general cognitive ability, self-reported intelligence predicts academic achievement even after controlling for standardized tests of intelligence (Chamorro-Premuzic et al., 2010). Similarly, meta-analyses show that self-reported emotional intelligence incrementally predicts job performance (Joseph and Newman, 2010) over and above ability-based tests of emotional intelligence. Even in the domain of attitudes, self-reported measures predict actual behavior over and above nonconscious tests of the same attitudes (Greenwald et al., 2009).

Measures of cultural intelligence appear to follow a similar pattern. For example, Rockstuhl et al. (2014) found that self-reported cultural intelligence incrementally predicted task performance in multicultural teams beyond a situational judgment test of cultural intelligence and other intelligence, personality, and experience predictors. This finding suggests that different measures of cultural intelligence reflect theoretically meaningful aspects of a person's cultural intelligence instead of mere bias. Hence, we propose that different measures of cultural intelligence should be used conjointly to provide a complete assessment of a person.

Nomological Network of Cultural Intelligence

The cultural intelligence construct has received worldwide interest. Empirical studies on cultural intelligence have been conducted in North America, South America, Europe, the Middle East, Asia, Australia, and New Zealand. Samples include expatriates, international business travelers, foreign laborers, global domestics, and international students. Altogether, cultural intelligence studies have sampled people from or working in at least 40 different countries.

Across these samples, scholars have studied (1) antecedents of cultural intelligence; (2) outcomes of cultural intelligence; (3) cultural intelligence as a mediator; (4) cultural intelligence as a moderator; and (5) boundary conditions of effects of cultural intelligence. To date, four major reviews have integrated empirical research on cultural intelligence (see Ang et al., 2011, in press; Leung et al., 2014; Ng et al., 2012). Below, we summarize empirical findings.

Antecedents of Cultural Intelligence

Research on antecedents of cultural intelligence has focused on personality traits and international experiences. As noted above, personality traits could relate to cultural intelligence because traits are broad and relatively stable individual differences that affect choices of behaviors and experiences, which in turn can influence the development of cultural intelligence. Among the Big-Five personality traits, openness to experience relates to all four cultural intelligence factors consistently across studies (see Ang et al., in press). Openness to experience refers to a person's tendency to be creative, imaginative, and adventurous (Costa and McCrae, 1992), thus pertaining to novel situations. Similarly, cultural intelligence is a set of capabilities targeted at novel and unfamiliar intercultural situations.

In contrast to the consistent findings for openness to experience, the findings for other Big-Five personality traits are more equivocal. For example, Şahin et al. (2013) found that extraversion was the second most important personality predictor of cultural intelligence, whereas Ang et al. (2007) found that conscientiousness was the second most important predictor of cultural intelligence.

Beyond the broad Big-Five personality traits, studies have also examined narrower traits as predictors of cultural intelligence. For example, of the six subfacets of openness to experience (i.e., intellectual efficiency, ingenuity, curiosity, aesthetics, tolerance, and depth), tolerance and curiosity were the strongest predictors of cultural intelligence (Oolders et al., 2008). Other narrow traits that research has linked to cultural intelligence include: (1) need for cognition and need for closure (Imai and Gelfand, 2010); (2) traits from the Multicultural Personality Questionnaire (i.e., emotional

stability, social initiative, open-mindedness, cultural empathy, and flexibility) (Ward et al., 2009); or (3) traits from the Cross-Cultural Adaptability Inventory (i.e., flexibility/openness, emotional resilience, perceptual acuity, and personal autonomy) (Ang et al., 2007).

Regarding international experiences, scholars have examined both work-related and nonwork-related international experiences. However, findings have not been consistent across the four cultural intelligence factors (for details, see Ng et al., 2012). In one study, the number of countries someone had previously worked in related positively to metacognitive and motivational cultural intelligence. In another study, the same measure of international experience related to metacognitive, cognitive, and behavioral cultural intelligence. Another study found that the length of international work experiences related to cognitive cultural intelligence only.

For nonwork-related international experiences, the number of countries visited related positively to all four cultural intelligence factors in one study, whereas the length of stay predicted metacognitive and cognitive cultural intelligence only. Another study found that the number of educational experiences abroad related positively to both cognitive and behavioral cultural intelligence, but the number of countries visited related only to motivational cultural intelligence.

Other studies have examined the effects of specific programs and interventions on the development of cultural intelligence. For example, participating in a 4-week virtual team project with team members from five countries increased team members' motivational-, metacognitive-, and behavioral-, but not cognitive, cultural intelligence (Shokef and Erez, 2008). Another program designed international experiences based on experiential learning and social contact principles (MacNab et al., 2012). In this program, the time spent interacting with culturally diverse others predicted increases in cultural intelligence for participants. Other studies have replicated the benefits of time spent interacting with culturally diverse others for the development of cultural intelligence (for details, see Ang et al., in press).

Besides personality traits and international experiences, few antecedents of cultural intelligence have been studied. Exceptions include foreign language skills and global identity – both of which relate positively to cultural intelligence.

Outcomes of Cultural Intelligence

Accumulating research shows that cultural intelligence relates to a wide range of cognitive, affective, and behavioral outcomes in intercultural contexts. Research shows that metacognitive and cognitive cultural intelligence predict cognitive outcomes stronger than motivational and behavioral cultural intelligence. An important cognitive outcome is cultural judgment and decision-making, which refers to the quality of decisions regarding intercultural interactions (Ang et al., 2007). Across multiple samples, metacognitive and cognitive cultural intelligence predicted better cultural judgment and decision-making (Ang et al., 2007). In a similar vein, metacognitive and cognitive cultural intelligence related positively with perceived cross-border environment uncertainty, and in turn the accuracy of risk assessments in international business ventures (Prado, 2006).

By contrast, motivational cultural intelligence is the most consistent predictor of affective outcomes in international contexts. To date, the most widely studied affective outcome has been cultural adjustment of sojourners and expatriates, which includes general adjustment (i.e., adjustment to general living conditions in a foreign culture), work adjustment (i.e., adjustment to work in a foreign culture), interactional adjustment (i.e., adjustment to socializing with locals in a foreign culture), psychological adjustment (i.e., feelings of well-being and satisfaction when living in a foreign culture), and sociocultural adjustment (i.e., being able to fit in or negotiate interactive aspects in a foreign culture).

Fourteen studies have examined these cultural adjustment outcomes (see Leung et al., 2014). These studies document consistently the benefits of high-cultural intelligence on all five forms of cultural adjustment. Across these studies, motivational cultural intelligence is the strongest predictor of cultural adjustment.

Beyond cultural adjustment, other studies show that people with higher cultural intelligence (1) experience less culture shock when living abroad (Chen et al., 2011); (2) experience less emotional exhaustion when traveling internationally for business (Tay et al., 2008); (3) report greater intention to complete their expatriate assignments (Wu and Ang, 2011); and (4) report greater satisfaction with their expatriate assignments (Huff, 2013).

Affective trust in culturally diverse others is another outcome that has received growing attention. Rockstuhl and Ng (2008) showed that people are more likely to trust culturally diverse others if (1) they have higher metacognitive cultural intelligence and (2) culturally diverse others have higher behavioral cultural intelligence. Notably, cultural intelligence influences affective trust only in culturally diverse but not in culturally homogeneous dyads. These findings highlight the unique relevance of cultural intelligence in intercultural contexts. At the team level, research also shows that multicultural teams with greater average team member cultural intelligence experience greater cohesion than teams with lower average cultural intelligence (Moynihan et al., 2006). A recent study sheds some light on possible mechanisms behind these effects. In particular, American working adults with greater metacognitive cultural intelligence had greater expectations of cooperative- or relationship-oriented goals – both for themselves and others – when preparing for an interaction with Chinese counterparts (Mor et al., 2013).

Finally, research has studied a wide range of behavioral outcomes of cultural intelligence. Many of these studies use multisource designs and control for a number of alternative predictors, such as general cognitive ability, emotional intelligence, Big-Five personality, and experience-based predictors. Based on levels of specificity, we classify these outcomes broadly into general job performance (including task performance, organizational citizenship behaviors, and adaptive performance), domain-specific performance (including global leadership and negotiation), and specific demonstrated behaviors.

Ten studies show that cultural intelligence predicts task performance in different work contexts, such as global work assignments and work in culturally diverse domestic settings (for details, see Leung et al., 2014). Across these studies,

metacognitive and behavioral cultural intelligence appear to be stronger predictors of task performance than motivational and cognitive cultural intelligence. These studies use self-reported measures of cultural intelligence. Two recent studies show that a situational judgment test of cultural intelligence likewise predicts task performance (Rockstuhl et al., 2013b, 2014). While task performance remains the most widely studied performance outcome to date, studies have also shown that cultural intelligence predicts citizenship behaviors (Rockstuhl et al., 2014; Wu and Ang, 2011) as well as adaptive performance (Oolders et al., 2008). At the team level, empirical evidence suggests that average team members' cultural intelligence predicts performance of multicultural teams (Groves and Feyerherm, 2011) and creative performance both in intercultural dyads (Chua et al., 2012) and multicultural teams (Crotty and Brett, 2012).

A number of studies have related cultural intelligence to global leadership. Several qualitative studies highlight the crucial role that cultural intelligence plays in managing subordinates and offshoring vendors from different cultural backgrounds. Quantitative studies confirm the importance of cultural intelligence for global leaders. Specifically, studies show that cultural intelligence predicts (1) subordinate-rated leader performance in multicultural teams (Groves and Feyerherm, 2011); (2) peer-rated leadership emergence in multicultural teams (Rockstuhl et al., 2013a); (3) peer-rated cross-border leadership effectiveness (Rockstuhl et al., 2011); and (4) peer-rated international leadership potential (Kim and Van Dyne, 2012). At the dyadic level, cultural intelligence of the lower of two intercultural negotiation partners predicts joint profits (Imai and Gelfand, 2010).

Recent studies have also begun to illuminate more specific or proximal behaviors that culturally intelligent people exhibit. For example, nonnative English speakers with higher cultural intelligence tend to interact more frequently with native English speakers, even after controlling for the ability to speak multiple languages (Beyene, 2007). Other studies show that individuals with high rather than low metacognitive cultural intelligence more frequently engage in (1) information sharing with culturally diverse others (Chua et al., 2012), and (2) more cooperative behaviors with culturally diverse others in mixed motive or prisoner's dilemmas (Mor et al., 2013). Similarly, individuals with higher cultural intelligence engage in more information sharing and cooperative-/relationship-management behaviors in intercultural negotiations (Imai and Gelfand, 2010). Perhaps as a result of such communicative and cooperative behaviors, people with higher cultural intelligence also tend to develop larger and more culturally diverse social networks than people with lower cultural intelligence. Mirroring these individual-level results, cultural intelligence at the team-level promotes fusion teamwork behaviors, i.e., teamwork behaviors that encourage meaningful participation and coexistence of different cultures (Crotty and Brett, 2012).

Cultural Intelligence as a Mediator

As noted above, personality and international experience are widely studied antecedents of cultural intelligence. Consequently, research has tested cultural intelligence as a mediator of the effects of these distal predictors on outcomes such as cultural adjustment, job performance, and global leadership (for details, see Ang et al., in press). Empirical studies show that cultural intelligence mediates the effects of personality traits. For example, cultural intelligence mediated the effects of Multicultural Personality traits on general adjustment in a sample of international students in New Zealand. In other studies, cultural intelligence mediated the effect of openness to experience on (1) job performance of expatriates in Malaysia and (2) adaptive performance of undergraduate exchange students in New Zealand.

Cultural intelligence also mediates effects of international experience. In a study of South Korean expatriates, cultural intelligence mediated the effects of previous international experience and predeparture cross-cultural training on cross-cultural adjustment. In a study of culturally diverse MBA students, cultural intelligence also mediated the effects of international experience on international leadership potential.

Finally, one study showed that cultural intelligence mediated the effects of a three-way interaction between home-country identity, host-country identity, and global identity on leadership emergence in multicultural teams.

Cultural Intelligence as a Moderator

Two studies have examined cultural intelligence as a moderator. In a study of senior expatriate leaders in various European countries, higher leader cultural intelligence strengthened the positive relationship between leader's transformational leadership style and organizational innovation (Elenkev and Manev, 2009).

Another study found that cultural intelligence moderated the effects of perceived cultural diversity on voice instrumentality (i.e., perceptions that voicing behaviors will lead to desired organizational changes), which in turn affected actual voice behaviors (Ng et al., 2011). In particular, although cultural diversity lowered voice instrumentality for individuals with low-cultural intelligence, it increased voice instrumentality for individuals with high-cultural intelligence.

Boundary Conditions of the Effects of Cultural Intelligence

More recent studies refine theoretical arguments about effects of cultural intelligence and examine their boundary conditions. Such studies have examined boundary conditions both for effects of international experience on cultural intelligence and for effects of cultural intelligence on outcomes.

In light of the inconsistent effects of international experience on cultural intelligence, scholars have advanced a number of boundary conditions of these effects (for details, see Ang et al., in press). One study found that positive effects of work-related international experience on cultural intelligence were stronger for people with a divergent rather than a convergent learning style. Similarly, another study found that positive effects of nonwork international experiences were strongest when people had high mastery-goal orientations and low performance-avoidance orientations in intercultural contexts. Other studies have found that effects of intercultural contact on cultural intelligence were stronger for (1) people with greater self-efficacy; (2) majority rather than minority members; and (3) people who had their first rather than subsequent intercultural service learning experiences.

Recent research also demonstrates the crucial role of cultural capital (i.e., international education and international experiences of one's parents) in fostering positive relationships between international experience and cultural intelligence. Two related studies found that cultural capital strengthened the indirect effects of international experience on global leadership via cultural intelligence. In particular, international experience related positively to cultural intelligence only when cultural capital was high. Cultural intelligence in turn predicted (1) supervisor-rated international military officer potential, and (2) peer-rated leadership emergence in multicultural teams.

Research on boundary conditions of the effects of cultural intelligence on outcomes has hypothesized and tested moderators that both attenuate and strengthen effects of motivational cultural intelligence. For example, G. Chen et al. (2010) found that subsidiary support (i.e., the extent to which the subsidiary helps expatriates adapt to their assignments and provides them with career and financial support) weakened the effect of motivational cultural intelligence on work adjustment and subsequently performance. Likewise, cultural distance (i.e., the extent to which the culture of the host country of the subsidiary is novel or different from expatriates' home countries) attenuated the effects of motivational cultural intelligence on work adjustment and performance.

By contrast, X.P. Chen et al. (2012) focused on contextual variables that strengthen the effects of individual motivational cultural intelligence. These authors showed that the effect of motivational cultural intelligence on cultural sales (number of sales transactions involving clients from cultures different from the employee's own) was stronger (1) when firm diversity climate (i.e., employees' shared perceptions of the extent to which their firm values diversity within the firm) was stronger; and (2) when firm motivational cultural intelligence (i.e., the firm's capacity to direct attention and energy toward learning about and functioning effectively in cross-cultural situations) was higher. Together, these studies begin to illuminate crucial contextual boundary conditions of the effects of cultural intelligence.

Conclusion and Future Research

Cultural intelligence refers to the capability or potential to function effectively across varying cultural contexts. Cultural intelligence research has demonstrated that cultural intelligence is a distinct capability that accounts for significant performance variance in intercultural contexts. Future research needs to validate recent theoretical extensions, in particular, the subdimensions of cultural intelligence (Van Dyne et al., 2012), neurological correlates of cultural intelligence (Rockstuhl et al., 2010), as well as organizational-level conceptualizations of cultural intelligence (Ang and Inkpen, 2008; Moon, 2010). We also expect to see an increasing diversity in the measurement of cultural intelligence. One such direction includes the development of direct behavioral assessments of cultural intelligence, such as assessment centers. Finally, we note that studies of team-level cultural intelligence remain rare and require more conceptual and empirical work. For example, future work could explore team composition models of cultural intelligence (i.e., how should cultural intelligence within a team be distributed?), as well as processes and norms associated with high team cultural intelligence.

Cultural Mediators and Gatekeepers

This article is a revision of the previous edition article by H. Verdaasdonk, volume 20, pp. 13295–13299, © 2001, Elsevier Ltd.

Abstract

The shaping influence of cultural mediators, in particular their legitimizing power, has led cultural scholars to coin them 'tastemakers,' 'gatekeepers,' 'surrogate consumers,' 'reputational entrepreneurs,' or even 'coproducers' of the work of art. Yet, in practice, mediators perform highly different and often distinct activities according to their particular contributions in the (increasingly) vertically differentiated process of cultural production. This article discusses the various roles and activities of cultural mediators, followed by a review of the role and impact of critics and other mediators in the production and consumption of culture.

Introduction

Cultural gatekeepers and mediators – such as publishers, film studios, gallery owners, critics, or reviewers – can be defined as those involved in the mediation between the production of cultural goods and the production of consumer tastes (Bourdieu, 1984).

With the rise of the market as the most important structure for cultural production and distribution, institutions and agents who are in effect mediators have taken on an increasingly crucial role in the development of artistic careers and reputations as well as the formation of cultural tastes and consumption patterns. Cultural mediators became vital agents to artists, not only with respect to the immediate problem of economic survival and reaching an audience, but also for the valuation of their work and the establishment of their reputations.

The formative role of cultural mediators is not limited to traditional 'high' arts worlds by any means. They play an equally important part in the cultural industries, scouting and selecting creative talent (Caves, 2000; Hesmondhalgh, 2012) and determining what creations are turned into marketable commodities and what products eventually reach audiences (Debenedetti, 2006; Hirsch, 1972).

This article reviews key concepts, findings, and developments in the social scientific study of the role and impact of critics and other mediators in the production and consumption of culture. While we start with providing an overview of the various roles and activities of cultural mediators, which are discerned in the literature, our main focus will be on how mediators – in particular reviewers and critics – affect symbolic production in the cultural field (e.g., reputations of artists, legitimacy of genres). Cultural mediators add symbolic value to culture, whether they are involved in the material production (e.g., publishers), distribution (e.g., art galleries), or evaluation (e.g., critics) of culture. Through their selective and evaluative activities they contribute to the "production of the value of the work or, what amounts to the same thing, of the belief in the value of the work" (Bourdieu, 1996: p. 229) by virtue of the symbolic capital or prestige they have acquired as cultural experts. For other work on cultural mediators such as organizational studies or macro-level analyses of power relations in the cultural industries, (see Globalization and World Culture).

We draw liberally upon work inspired by various research perspectives that have been developed by empirically oriented cultural scholars from the 1970s onwards, including the production-of-culture perspective (Peterson and Anand, 2004); art world research (Becker, 1982); field theory (Bourdieu, 1984, 1996; Van Rees and Dorleijn, 2001); artistic classification systems theory (DiMaggio, 1987); and neo-institutional theory (Dowd, 2011). Although these approaches have different points of departure, employ different concepts and methodologies, and focus on different aspects of cultural production and consumption, no clear-cut divisions exist between them. Many individual researchers and studies, with good reason, can be viewed as representative of more than one approach. It lies outside the scope of this article to detail similarities and differences among them.

It is most important in this context that they all have illuminated, in one way or another, the thoroughly social nature of cultural production. This refers not only to the way in which a variety of people are actually involved in the production of a work itself (Becker, 1982), but also to the underlying processes and conditions that make the production possible and those, which determine its subsequent course.

Role of Cultural Mediators in the Lifecycle of Cultural Products

Most studies on cultural mediators have focused on how they impact artistic careers and reputations or influence the preferences and tastes of cultural consumers. The modus operandi of cultural mediators themselves has received somewhat less attention. Cultural mediators generally operate in fields characterized by turbulence, a huge supply of cultural offerings and aspiring artists, (demand) uncertainty, and a lack of unequivocal quality standards. In order to understand how they cope with these challenges and constraints we need to consider the organizational and institutional settings in which they perform their various mediating activities.

The past decades witnessed a flood of research on how mediators in the field of art and culture shape individual works and whole careers. The shaping influence of cultural mediators, in particular their legitimizing power, has led sociologists to coin them 'tastemakers,' 'gatekeepers,' 'surrogate consumers,'

'reputational entrepreneurs,' or even 'coproducers' of the work of art. Yet, in reality mediators perform highly different and often distinct activities according to their particular contributions in the (increasingly) vertically differentiated process of cultural production. Taking the production cycle of cultural products as a starting point, we can distinguish (at least) seven widespread mediating practices, which substantially inform the modus operandi of cultural mediators.

Selecting from the Supply (Gatekeeping)

One of the most studied aspects in the work of cultural mediators relates to what constitutes an essential dilemma in cultural production: of all the artists who turn to cultural organizations or sponsors to seek financial help in getting their products to an audience, only a limited number can actually receive such sponsorship. Agents such as publishers, Artists and repertoire (A&R) staff of record companies, or museum curators are responsible for making a first selection from the artists who are deemed worthy of being produced: they are the gatekeepers of the artistic field.

The term 'gatekeeping' has been applied when the focus is on judgments whether to admit persons or works into a cultural field; it has to do with accepting or rejecting works or their creators and the consequences of these choices for subsequent works and creators. Driving forces behind gatekeepers' decisions range from political and moral concerns, commercial interests, to 'purely' aesthetic motives. In most cases, they consist of a mixture of these.

The concept originates primarily from research into news production (Shoemaker and Vos, 2009), but it can be applied more or less equally to other areas of cultural production.

Gatekeeping refers to the capacity of mediators to exclude or promote. However, cultural industries from book publishing to television regularly make decisions other than choose/reject, altering or recontextualizing works at different stages of the production process. When the focus is on the way that works are changed as they move from being ideas to being finished products, the term decision making is more appropriate (Peterson and Anand, 2004). In the music industry, the original ideas of songwriters are filtered through music publishers' ideas concerning presentation (especially artist and style), which then play a part in promoting the product in several different markets. Processing takes place on the basis of a prediction about what the next 'gatekeeper' in the chain will think, the key being the overall product image.

It should be noted that most 'gatekeepers' are not passively waiting for new talents to submit their work. Research into the literary field has for instance shown how acquisition editors at publishing houses employ various search strategies (e.g., befriended foreign colleagues, agents, scouts, book auctions) to find the authors they want to publish (Franssen and Kuipers, 2013; Thompson, 2010). Similarly, in the music industries A&R managers or talent buyers in the live music scene actively scout for talent (Foster et al., 2011; Negus, 1999).

Cocreating/Editing

The next step in the production cycle is 'cocreating' or 'editing,' all the activities and feedbacks that mediators provide to artists to meet standards of artistic conventions or commercial expectations. These practices generally receive much less academic attention than gatekeeping. One reason is that, as the previous examples showed, the boundaries between gatekeeping and cocreating are often diffuse. As 'coproducers' many gatekeepers guide artists through the production process, shaping the content of cultural products (Becker, 1982; Peterson and Anand, 2004). Another reason, however, appears to be persistent influence of what Bourdieu called the 'charismatic ideology': the tendency to interpret all works of art as outbursts of individual creativity thereby downplaying the contributions of relevant others. Still, most cultural fields contain some form of cocreation: the sound of music records is adapted by producers and technicians, literary texts are fine-tuned by editors or translated by translators, and in film and television, producers and directors exert their influence on various levels: script, actors, photography, special effects, etc.

Connecting/Networking

Within a sector that is as strongly dependent on collaboration as the cultural sector (Becker, 1982), mediators are almost by definition connectors. The gatekeepers who scout for talent via their networks (see above) provide an obvious example. Yet some studies have highlighted how certain cultural mediators are specialized in connecting. We mention some examples. Literary agents have become powerful players in the field of fiction book publishing (Thompson, 2010). They negotiate the deals that authors make with publishers, but at the same time also actively manage their portfolio of author clients to establish their own reputation. This form of cultural brokerage – matching authors and publishers of similar standing – ultimately influences which type of authors are being published in the field (not unlike the influence of song-pluggers in the music industry).

Art dealers, gallery owners, auctioneers, and curators play a similar part in the visual arts, determining which works, artists, and schools come before the public as well as urging artists to produce certain types of work (Moulin, 1987; Quemin, 1997; Velthuis, 2005). Like independent agents spanning organizational boundaries in the recording industry, dealers seek artistic 'talent' in one group and corresponding buyers in a different group. Successful artists are those who recognize the privileged 'entrepreneurial' position of their dealers and listen to their feedback about clients' aesthetic sensibilities.

Selling/Marketing

In the final stage of the production process we find mediators who sell or market the products, and thus establish the contact with the audience. Production organizations in the cultural industries, such as publishing, music, or movie companies, depend for the successful dissemination of their products on media gatekeepers whose 'free publicity' is often more effective than advertising because of its alleged objectivity. Typical strategies to cope with constraints posed by media gatekeepers include the employment of specialized promotion and public relations personnel, overproduction, differential promotion of new products, and cooptation of media gatekeepers (Hirsch, 1972). The latter strategy is often at odds with the interests of media organizations, which are supposed to deploy

independent standards in their selection and assessment of cultural products (rather than promoting items which cultural organization put forward), while at the same time they have to attune their coverage to the target audiences of their advertisers. Hence, the efforts of cultural organizations to influence media gatekeepers vary to the extent that media coverage is vital for generating consumer demand.

Distributing

In most cultural fields, distribution comprises a form of mediation situated outside production. A number of research themes have emerged in the literature. First of all, the continuing competition between producers and distributors for economic dominance due to their interdependence – producers need the network to bring their products to the audience; distributors need attractive products to offer the audience. Fluctuations in the market power of these institutions inform takeovers and subsequent vertical integration. Another, more micro-oriented approach focuses on how distributors shape the production of culture. Thompson (2010), for instance, showed how the rise of book retailers changed the practices of publishers and ultimately the books that are released. Of course, distribution has become an even more timely research theme for mass-produced products as a consequence of digitalization (see later).

Whereas cultural industries studies routinely refer to distribution as the process of bringing products into circulation for sale (e.g., stores, galleries), display (film exhibitors), or performance (theaters), some institutions primarily seek to make culture more accessible (e.g., libraries and art loan organizations). Other ways of disseminating culture impact symbolic production. Festivals and biennales have become events where like-minded audiences gather to experience a special selection of products generally in a relaxed setting with food, drinks, and other entertainment, but whose most successful exponents propel high status (e.g., Cannes film festival or the Venice Biennale).

One can also think of educational institutions and art histories that mediate the relationship between artists and audiences. Curricula and cultural encyclopedias emphasize some works to such an extent that they become institutionalized as canonical art. Schoolbooks tell students whom to read and what kinds of things to say about literary texts. Meanwhile, educators' book orders help to determine which books remain available and enjoy regular updates.

Evaluating, Classifying, and Meaning Making

Many agents and organizations in the cultural field have no immediate interest in the artistic or commercial success of cultural products, but aim to judge the value and/or meaning of cultural endeavors. Most of these mediators (e.g., reviewers, critics, scholars) are situated in the field of media and academia. While Kees Van Rees (1983, 1989) was one of the first to analyze the three-step procedure of critics – description, interpretation, evaluation – and its problematic connection to 'critic's connoisseurship,' many researchers since have been working on cultural evaluation.

We will discuss the work of reviewers and critics in more detail in our Section The Impact of Critics and Other Mediators on Symbolic Production, but would like to point out some other adjacent roads this research has taken. For instance, the traditionally humanistic take on how art can be described and interpreted has been rephrased and readdressed using entirely different methodologies, as the study of cultural meaning by cultural sociologists such as John Mohr (*see* Formal Methods of Cultural Analysis) and Wendy Griswold. Griswold has demonstrated in various publications how mediators in the literary field 'fabricate' cultural meaning from socially shaped presuppositions in close dialogue with the particular characteristics of the cultural object. Another strand of research addresses cultural classification systems. Inspired by the work of Paul DiMaggio (1987) and others, scholars have started to unravel how mediators create, negotiate, and transform genre classifications, thereby impacting audience perceptions and market success (e.g., Zuckerman and Tai-Young Kim, 2003; *see* Classifications in Popular Music).

Censoring, Protecting, and Supporting

An entirely different type of mediating concerns censoring and other policy-related instruments. Political and legal constraints on artists' work and careers belong to the pervasive themes in the sociology of the arts (Alexander and Rueschemeyer, 2005; Peterson and Anand, 2004). Government bodies and laws, either through the carrot of support or the stick of censorship, accomplish exclusion and channeling in the visual arts, literature, and other cultural domains. Many studies have focused on how censorship operates to reduce freedom of expression, but censorship may also provide the stimulus for more complex symbol expression, illusion, euphemism, analogies, and the like.

Policy agents can also protect and support particular types of artists and products. In recent decades, three important research themes received attention. First, cultural globalization studies have highlighted how countries differ in taking legislative measures to protect local artists from competition from foreign artists. Examples are the installment of quota for national music to be played on the radio, or the subsidizing of the national film industry. Second emerging theme, which is directly related to changing patterns in cultural consumption, concerns the tension between highbrow and popular arts. Whereas highbrow art forms such as classical music and theater generally receive the bulk of governmental support, it is increasingly signaled in the media that their audience generally represents just a small, relatively affluent portion of society. A third much debated policy issue is how to retain a meaningful copyright system that protects artists and producers from the unlawful reproduction or distribution of their works while at the same time preserving the innovative power of the Internet and the free flow of information.

The Impact of Critics and Other Mediators on Symbolic Production

Institutional Context of Cultural Evaluation

Cultural mediators are also confronted with challenges and risks of a different nature, which have to do with the institutional setting in which they perform their selective and evaluative

tasks. Their selections and evaluations do not only affect the reputations of cultural products and their makers, but also their own status and authority ('their symbolic capital') in the field.

This applies to all professional experts involved in the selection and valuation of cultural products – talent scouts, agents, publishers, film or music producers, curators, theater programmers, etc. – but it holds a fortiori for critics and reviewers whose selections and evaluations are made publicly available. As Bourdieu (1983: p. 317) points out: "Every critical affirmation contains, on the one hand, a recognition of the value of the work which occasions it, which is thus designated as worthy object of legitimate discourse (…), and, on the other hand, an affirmation of its own legitimacy. Every critic declares not only his judgment of the work, but also his claim to the right to talk about it and judge it."

Like all cultural experts, critics need to gain recognition as connoisseur and to inspire confidence in their capacity to assess the properties and value of a work. However, critics lack a reliable instrument to assess aesthetic qualities in an unequivocal way and no objective agency or procedure can prove their evaluations true or false (Van Rees, 1989). Moreover, they have to perform their job in a context of numerous cultural offerings and limited media space, keeping in mind the audience their media is supposed to serve.

That is why critics take into account various institutional quality indicators in their selection and assessment of new cultural products (Janssen, 1997). Particularly, they consider the reputation of the cultural organization (e.g., the publisher, film company, music label, theater, or gallery) that brings a work or artist on the market and previous critical assessments of an artist's work (i.e., the artist's reputation). They also take due note of the cultural coverage of other media outlets, notably those which are active in the same market segment. Moreover, they strongly rely on genre classifications and genre conventions (Glynn and Lounsbury, 2005; Zuckerman and Tai-Young Kim, 2003), as well as on 'background' and 'inside' information they receive through their contacts with representatives of cultural organizations, peers, and other experts in their professional networks (Bielby and Bielby, 1994).

In considering the institutional 'clues' provided by established reputations, peer opinions, genre distinctions, competitors, and professional networks, critics reduce the uncertainty as to which works deserve their attention and how to express this attention. In doing so, they enhance the odds that their assessments will be taken seriously or even get adopted by their fellow critics and other experts. Ultimately, the authority of critics and other mediators depends on the credits they have earned by making 'successful' evaluations, i.e., evaluations that were adopted by other experts in the field and are trusted by the audiences they serve. This does not imply that critics should always comply with their peers. On the contrary, they have to distinguish themselves in order to gain prestige as a connoisseur. By developing perspectives, which qualify previous critical tenets or by deviating in their evaluations or their choice of works for discussion critics may make their mark as 'independent' experts. However, the institutional framework within which they function poses limits to the scope for dissent (Janssen, 1997; Van Rees, 1989).

The above strategies to minimize uncertainties and risks in critic's assessment of cultural products are also omnipresent in the decision-making processes of other cultural mediators. Like critics, other mediators base their selections and decisions to a large extent on the institutional knowledge and contextual information they have about cultural products and their creators, including their classification into particular genres; the recognition creators have are thus far received from various actors in the field; the reputations of their organizational sponsors; the choices made by competitors; and the information and opinions of members of their professional networks.

Reputation Making and Cultural Consecration

Critics and other experts play a crucial role in the establishment and survival of artistic reputations. Artists and their critic-advocates seeking recognition make claims of creativity, quality, innovativeness, excellence – that is 'talent' or 'genius.' While sociological theory and method are not very useful in identifying 'talent' or 'genius' in works or their makers, they have proved very helpful in demystifying canon formation, the processes by which claims of 'genius' or 'quality' come to be agreed upon and reputations established (Menger, 2014).

Art critics, curators, and gallery owners appear to 'discover' new artistic geniuses all the time in a promotional role that plays a crucial part in the distribution of paintings to sophisticated buyers who would not dream of being influenced by advertising (Moulin, 1987). Studies of the contemporary art market (Velthuis, 2005) underline the promotional capacity of art experts as well as their key role in the construction of artistic value.

How the value and nature of literary works come to be agreed upon by critics and writers' reputations established is illuminated in many studies (Berkers et al., 2014; Janssen, 1997; Van Rees and Dorleijn, 2001). Van Rees (1983), for example, details how the complementary activity reviewers, essayists, and academic critics determine to a great extent which texts are regarded as legitimate forms of fiction; what rank they are supposed to occupy within the hierarchy of literary works; and what statements count as proper and relevant ways of characterizing these texts.

Critics are also key agents in acts and processes of cultural 'consecration,' whereby a few artists and works are identified and set apart from others in their field as exceptionally valuable and gain an exemplary and celebrated status. Cultural consecration refers to the establishment of a 'magical division' between the 'pure' and 'sacred' cultural offerings, on the one side, and the 'facile' or "profane" products on the other (Bourdieu, 1984). Critical attention, peer recognition, and public acclaim all affect the odds that some artists or works are eventually counted among the 'greatest of all time.' Cultural scholars have examined acts and processes of consecration in a variety of cultural fields including literature (Van Rees and Dorleijn, 2001), film (Allen and Lincoln, 2004), visual arts (Ginsburgh and Weyers, 2006), classical music (Dowd, 2011), and popular music (Bennett, 2009). This research has shown that critical recognition is especially important in the consecration of cultural producers and their works.

Cultural Legitimation

'Retrospective' consecration of some works and artists also takes place because art world members seek to raise the prestige of their field by highlighting "elements of their pasts which are most clearly artistic, while suppressing less desirable ancestors" (Becker, 1982: p. 339). In rewriting the history of their field, critics and other experts try to show it has always generated artistically valuable work. Thus retrospective cultural consecration not merely singles out the greatest works or artists in a field but is also a means of bestowing legitimacy upon an entire field of cultural production.

The processes and mechanisms through which cultural forms attain artistic legitimacy have garnered much attention over the past decades. Cultural and organizational scholars have highlighted the role of social change in creating an 'opportunity space' for ascendant art forms (Baumann, 2007; DiMaggio, 1992). Claims of cultural value emerge in a wider social context, which may change over time in terms of the degree of competition, the availability of alternatives or substitutes, public interest, etc., and as such affect whether particular products and genres will gain cultural legitimacy. Cultural legitimation is also contingent upon the institutional and organizational resources (e.g., money, labor, knowledge, networks) that art world members manage to mobilize (Baumann, 2007; Becker, 1982).

A third key factor in processes of cultural legitimation is the development of a legitimating ideology that substantiates claims to artistic value and lends symbolic prestige to a cultural field (Baumann, 2007; Becker, 1982; Bourdieu, 1984; Van Rees, 1983). Artistic value attribution calls for *an explanation* of why particular cultural objects or genres can be deemed artistically important (Baumann, 2007). Media critics and reviewers – drawing on academic criticism – play a central role in developing and disseminating such explanations of artistic worth and are thus crucial agents in elevating the status of cultural forms and genres.

The impact of critics and reviewers may appear more salient in traditional high art worlds where their expert status is institutionally embedded and reinforced through academic programmes and educationally curricula (Baumann, 2007; Bourdieu, 1984; Van Rees and Dorleijn, 2001). However, the impact of media attention and critical discourse is also crucial in the valorization and aesthetic mobility of a variety of popular cultural forms.

Baumann (2007) demonstrates how the intellectualizing discourse of film critics, who over the years increasingly employed terminology (e.g., art, genius) and reviewing techniques (e.g., mentions and comparisons of directors) associated with high culture, contributed to the cultural legitimation of film in the United States. The development of this 'high art discourse' in film reviewing paved the way for the wider acceptance of film as art as it resonated with the cultural capital of higher educated audiences, peer critics and other members of the field. Critics and reviewers have been found to play a similar role in the valorization of a variety of other cultural forms (Janssen et al., 2011), including jazz, popular music, television, and fashion.

Meanwhile, the past decades also witnessed the rise of alternative, 'popular' forms of critical discourse, albeit often in less prestigious settings. Pop music reviews, for example, are often characterized by a popular aesthetic discourse, in which functionality, entertainment and other more audience oriented criteria prevail over high arts standards (Van Venrooij and Schmutz, 2010). Likewise, Kersten and Bielby (2012) find that contemporary film reviews "incorporate aesthetic elements drawn from popular interests as well as elite art considerations, thereby complicating critics' aesthetic systems and analysts' classificatory schemes."

Impact on Cultural Tastes, Consumer Behavior, Commercial Success

Many studies have found an influence of media critics and reviewers on consumer preferences and the commercial performance of cultural products, notably in the field of film and the performing arts (Debenedetti, 2006). When the supply is large, time is scarce, and markets are flooded with commercial information, consumers can draw on critical evaluations to simplify the decision-making process and reduce the basic uncertainty associated with experiential products of which the quality is hard to assess prior to consumption. Nonetheless, whether critics' opinions influence the commercial success of products remains contested and seems to depend on specific features of the product and/or the specific audience at which the product is targeted (Gemser et al., 2007). Individual audience characteristics also play a part. Cultural participants who are more involved or have more expertise are more likely to use reviews than others.

The correlation between critical evaluation and commercial success has been found to be particularly strong for cultural products that have weak signaling properties for the general public (e.g., lack a high-profile cast, special effects, exotic locations, and/or elaborate sets), low-budget works that cannot rely heavily on promotional devices (such as previews, trailers and advertisements) to shape consumer preferences and belong to unfamiliar genres (Debenedetti, 2006).

For blockbuster movies targeting large audiences, the amount of media coverage has a stronger impact on box office performance than whether reviews contain positive evaluations. However, in the case of art house movies and other films that cater for artistically oriented audiences, critical evaluations and recommendations have positive effects on commercial success (Gemser et al., 2007). Thus, whereas 'art' films need positive reviews to gain industry recognition, the commercial success of mainstream films depends on being noticed and creating a 'buzz' (Holbrook and Addis, 2008).

These findings agree with socially embedded patterns of media use and cultural tastes, as well as with the institutional embeddedness of critics. A preference for cultural products of a particular degree of legitimacy often coincides with using media enjoying a similar degree of legitimacy (Bennett et al., 2009; Bourdieu, 1984). The influence of a review thus depends on the critic's or medium's social and cultural proximity to the reader. Cultural participants who have a taste for 'highbrow' cultural products often read the print media in which such products receive extensive coverage, (e.g., 'quality' newspapers) and via processes of self-selection they are (thus) likely to take critics' judgments into consideration (Janssen et al., 2011; Verboord, 2013).

Cross-Cultural Exchange

Cultural mediators are also important when it comes to the international mobility, visibility, and reception of cultural products (Crane et al., 2002). Griswold (1987) considers the export of meaning beyond national borders and the transformations of meaning, which occur through this process. Comparing American, British, and West Indian reviews of the work of the Barbadian novelist George Lamming, she finds stunning cross-cultural divergences. Race is highlighted in American reviews of Lamming's novels, yet virtually ignored in British discussions, which focus instead on the novels' language and literary qualities.

In spite of ongoing 'cultural globalization,' and in contrast to the so-called 'contra-flow' argument, coverage of foreign culture in the European and US elite newspapers has not become much more global between 1955 and 2005 (Berkers et al., 2011; Janssen et al., 2008). The global diversity of cultural coverage has increased, but international art coverage has remained largely confined to a select group of countries belonging to the core of the cultural world system, while domestic cultural products continue to be prominently featured in the cultural coverage of elite newspapers. These findings, which are in line with those of many other empirical studies, underscore how cultural mediators, can enhance the enduring imbalances in international cultural exchanges, and, may promote and sustain local cultural production.

Of course, they can also serve as 'gatemakers' pushing the boundaries of international cultural traffic, as is evidenced, for example, by the foreign literature series that French publishers developed with the help of the French ministry of culture in the 2000s, featuring translations from more than 30 small and peripheral languages into French (Sapiro, 2010). Similarly, Kuipers (2011) shows how television buyers who mediate and maintain relations between the national and transnational television field, play an important role in the diffusion of quality standards, practices, and programs into national fields of television production, and, from there, to consumers.

Developments Impacting the Role and Authority of Cultural Mediators

Increasing globalization has enhanced the risks and uncertainties inherent in the work of cultural mediators, such as publishers, curators, festival programmers, casting agencies, music producers, and television broadcasters. In addition to an already huge supply of domestic products, cultural mediators are confronted with an overwhelming abundance and diversity of foreign cultural offerings, for which the audience interest, market potential, and artistic merits are difficult to assess.

At the same time, due to the advancing commercialization of cultural production fields, cultural mediators face heightened competition, both in national cultural fields and the fast-paced, highly competitive transnational cultural arenas in which the odds of success and recognition are very unequal for players from different countries and places.

The intensified use and increased interactivity of the Internet have transformed the ways in which cultural information is being searched, created, and valued (*see* Internet and Culture). In recent years, cultural consumers across the globe have increasingly turned toward the web: to purchase cultural products at online shops; download and upload music, videos, films, and other content; rate and review cultural products; get advice and recommendations from other consumers; and engage in debates and discussions on social network sites. Many cultural websites prosper through participatory practices by audiences. Peer-to-peer communication enables audiences to create, share and evaluate user-generated content and actively participate in cultural opinion making.

Increasingly, Internet users thus seem to be moving away from institutional gatekeepers and experts and instead refer to information provided by other Internet users. This trend does not merely undermine the authority of these cultural mediators, but also appears to erode the entire underlying system in which institutionally embedded experts decide on the value and legitimacy of cultural artifacts in society (Verboord, 2013). 'Bottom-up' practices of selecting and evaluating culture challenge the existent 'hierarchical' model of cultural valorization, in which critics and other mediators play a pivotal role by legitimizing the culture from the higher status groups through their cultural authority.

However, this development is not just caused by the rise of new media technologies and associated opportunities and practices for cultural consumers, but is deeply rooted in wider societal and cultural changes that occurred since the 1960s in Western societies. The democratization of higher education, the emancipation of minorities (women, youngsters, ethnic, racial, and sexual minorities), increased social mobility and heterogeneity contributed to the erosion of traditional cultural hierarchies and the rise of omnivorous taste patterns, while it also enabled social climbers and minorities to 'import' their tastes into higher circles and to bestow prestige upon their preferred genres. Processes of individualization have made people less prone to subscribe to traditional cultural hierarchies, collective taste patterns, and the judgments of cultural experts, but, instead, increasingly require them to choose individually and to show individual authenticity in their expression of taste (Janssen et al., 2011).

These developments profoundly affect the work of critics and other cultural mediators. As the institutional consensus and institutionally embedded authority through which they used to operate declines, their position becomes more dependent on the uncertainties and vagaries of the market, requiring them to stay more closely attuned to or follow audience interests and consumer preferences.

Future Research

Many avenues for further research relate to the fast changing cultural landscape in which mediators maneuver. One obvious subject for future research already mentioned concerns the rise of the Internet. Many forms of mediating appear to become obsolete as technologies enable artists to bypass mediators. Publishers, record companies, book stores, record stores, newspapers: they are all under pressure, and how their possible disappearance would impact the way culture, and cultural value, is being produced is far from clear.

How increased globalization and the emergence of transnational cultural fields transform the role and practices of cultural mediators, and how this plays out, at the local and transnational level, for agents from different countries and places across the globe, are other issues which definitely call for further research.

Yet also other developments deserve attention: the increasing segmentation and differentiation of cultural work (e.g., the rise of live music industries; literary agents), the advance of oligopolies (in music and film production) and monopolies (online: Google, Amazon; offline: LiveNation), and the decreasing support for the arts among general populations, which impacts not only the work and careers of artists but also the professional lives of the manifold mediators who contribute to the highly differentiated processes of cultural production and distribution.

Abstract

This article focuses on trends in cultural participation. How have the extent and the way in which people consume culture changed? Research shows that participation in highbrow culture remains relatively stable, whereas the consumption of popular, commercial culture has increased since the 1970s. A number of societal developments drive these evolutions in cultural participation. Sociodemographic changes, most notably educational expansion, as well as the rise of the entertainment industry and the Internet boom, greatly affect the field of artistic production, mediation, and consumption. These changes result in the shifting, or, as some argue, the erosion of esthetic boundaries, and the rise of the cultural omnivore – someone who participates in a variety of cultural activities – as provisional endpoints.

Introduction

In this study of trends in cultural participation, we focus on how cultural practices have changed over the past few decades and on how the relationship between practices and position in the social hierarchy has evolved. Our research perspective owes a great deal to Pierre Bourdieu's research on cultural fields, cultural participation, distinction, cultural capital, and education. Bourdieu's work builds on Max Weber's idea of status cultures and on the distinction Durkheim makes between the sacred and the profane. Cultural participation ranges from high to low, from arts participation and consumption of highbrow cultural products (e.g., visiting museums, attending the opera, and reading books) to consumption of lowbrow products (e.g., listening to rock music or going to the movies). Since the publication of Bourdieu's *La Distinction* (1979), research on cultural participation has thrived, and empirical studies have shown recurring patterns across nations and times. Results consistently show that arts participation – defined here as the consumption of highbrow symbolic, artistic goods in the public and/or private sphere – is predominantly situated among the highly educated and the upper and middle classes. In the Bourdieusian paradigm, cultural participation is regarded as a manifestation of cultural capital, as a means of maximizing life chances and opportunities by accumulating and monopolizing scarce economic, social, and cultural resources (Bourdieu, 1986).

Since the 1960s – both in the United States and Europe – a number of evolutions have challenged the monopoly that arts participation has held as a means of ensuring and proclaiming a dominant social position. These include changes in the field of cultural production with the entertainment industry's rise, the advent of television, and the Internet's boom. Now, individuals have unprecedented access to a huge and varied supply of cultural experiences. Changes in cultural supply are paralleled by changes in the field of consumption. Large sociodemographic changes, such as educational expansion/democratization, the increase in women's labor force participation, and the aging of the population have placed additional strain on the monopoly and legitimacy of the prestigious highbrow arts as an essential part of an individual's *Bildung* – the idea that familiarity with the *beaux arts* is essential to a person's upbringing. The deinstitutionalization of high culture (DiMaggio, 1987, 1991), in addition to the waning of cultural hierarchies, may have reinforced these trends. Studying trends in cultural participation is relevant for two reasons. It makes it possible (1) to document how the constitution of cultural capital may have changed, and (2) to probe the implications of this change for the dynamics of social reproduction and inequality.

Trends in Participation: Facts and Figures

How has the frequency of cultural participation evolved over time and can changes be detected in audience composition? Rather unfortunately, one characteristic of research on trends in cultural participation is the scarcity of available data. Notable exceptions to this are found in the Netherlands, where the Social and Cultural Planning Office (SCP) has conducted the Aanvullend Voorzieningengebruik Onderzoek ("Amenities and Services Utilization Survey") every 4 years since 1979; in Denmark (Danish National Centre for Social Research 1975, 1987, 1993, 1998, 2004), and in the United States (Survey of Public Participation in the Arts (SPPA) 1982, 1992, 2002, 2008; and the General Social Survey (GSS) 1993, 2002, 2010). Moreover, the activities recorded in most of these surveys are biased toward legitimate, highbrow genres, especially in the first waves. Additionally, it is unclear to what extent the categories used in questionnaires vary over time and across geographic boundaries (Marsden and Swingle, 1994; Peterson, 2005).

We present trends for four forms of cultural participation: attending classical concerts, visiting museums, reading books, and going to the movies. For Europe we use data on the Netherlands (**Table 1**). Data for the United States are shown in **Table 2**. The figures cannot accurately portray the complexities and specificities of all developments in the different genres. For a more and detailed discussion, we refer to Van Eijck and Knulst (2005) and to DiMaggio and Mukhtar (2004).

The Dutch data reveal three parallel evolutions (Knulst and Kraaykamp, 1998; Van Eijck et al., 2002; Van Eijck and Knulst, 2005). First, the data show that, in general, participation in highbrow cultural activities has not decreased dramatically and that evolutions in participation depend on the particular

[a]Not available in the 1982 and 1985 waves.
Survey of Public Participation in the Arts 1982, 1985, 1992, 2002, 2008.

cultural genre or domain. Attending classical concerts and going to the opera (not shown), for example, remain stable at around 12 and 5%, respectively, whereas reading books has decreased over the last few decades. Since the 1970s, visiting rates for museums have risen from 26% in 1979 to 41% in 2007. Second, evolutions differ between generations: younger generations, aged 45 or younger, show a decreased participation in these forms of highbrow culture. In particular, reading books declines steeply, although it remains stable in older generations. And third, in addition to these trends in arts participation, participation in the popular, commercial culture in the Netherlands has increased over time, both for younger and older generations. The proportion of those going to the movies has been rising since the 1990s, from 45% in 1991 to 56% in 2007. This trend is corroborated by data from Denmark where participation in popular, lowbrow public culture – such as attending pop concerts and going to the movies – has increased since 1975 (Jæger and Katz-Gerro, 2010; Katz-Gerro and Jæger, 2011).

In the United States, DiMaggio and Mukhtar (2004), using SPPA data (1982, 1992, 2002), show similar evolutions. Participation in highbrow culture has declined since 1982 (see Table 2). This general decline is more substantial among younger cohorts and among highly educated groups in society. Table 2 shows that in 1982, 13% of the US population younger than 45 attended a classical concert the past year, compared with 8% in 2008. Comparable numbers for US citizens aged 45 or older are 13% in 1982 versus 11% in 2008. Two types of cultural participation – visiting art museums and attending jazz concerts – deviate from this general pattern as attendance of

these public practices has either remained stable or increased since 1982. The observation that museum attendance follows a distinct trend compared with other forms of cultural participation parallels findings in Europe, where Knulst has observed increased museum attendance since the 1950s in the Netherlands (Knulst, 1993; see also **Table 1**). DiMaggio and Mukhtar (2004) consider the increased popularity of art museums and jazz to be an indication of the rise of the omnivore, a type of cultural consumer that has eclectic, inclusive tastes and shows interest in a broad variety of cultural practices, mixing lowbrow and highbrow cultural genres.

In the 1990s, Richard Peterson and his colleagues published a series of papers in which they show a marked shift in the cultural preferences of younger generations (Peterson, 1992; Peterson and Kern, 1996; Peterson and Simkus, 1992). Between 1982 and 1992 the preference for folk and pop music increased for people who also enjoy classical music genres. This change is most evident in the younger cohorts. Peterson's thesis on omnivorousness has spurred researchers all over the world to empirically test this supposed shift from snob to omnivore, and that research has met with great success – omnivores are present in the United States, Canada, Europe, and Australia (e.g., Bryson, 1996, 1997; Coulangeon, 2005; Emmison, 2003; Erickson, 1996; Van Eijck, 1999). The cultural omnivore is generally young, highly educated, and from the middle and/or upper middle classes.

Interpretations of Trends in Cultural Participation

To explain these trends, some scholars highlight the importance of changes in the field of cultural production and mediation, the degree of institutionalization of the arts in the educational system and state-subsidized cultural organizations. Other researchers focus on socioeconomic and cultural factors affecting the behavior of cultural participants. Given the macrosociological nature of most of these trends, many of these studies lack decisive or conclusive empirical evidence for most of their hypotheses. The insights presented in the overview therefore remain tentative and explorative.

Changes Affecting the Field of Cultural Production and Mediation

The Rise of the Entertainment Industry

The first and most obvious evolution in the field of cultural production since the 1960s is the spectacular growth of commercial popular culture and the entertainment industry (Turow, 1992). Commercial cultural offerings have become so widespread and pervasive that they challenge the relative share of the arts in people's leisure activity patterns. The fine arts and their nonprofit institutions must compete with offerings from a wide array of commercial music, films, and books produced by a booming industry, and many find it difficult to maintain their cultural centrality and the position as institutionalized cultural products that had been taken for granted in the past (Warde et al., 1999). The competition between the arts and commercial symbolic goods has become acute as the penetration rates of television rise. For example, television programs offer easily accessible at-home entertainment that – given a certain time budget – are able to successfully compete with the entertainment literature for audiences (Knulst, 1991; Van Eijck and Van Rees, 2000; Weibull, 1992). This competition has intensified with the rise of the Internet, which enables producers to constantly offer products in people's homes on demand. This creates a context of cultural abundance both for the general public and niche market audiences (Wright, 2011). Television and the new media also enable previously local cultural products to reach audiences scattered around the globe. Studies of local scenes (e.g., Cohen, 1991; Shank, 1994) show that music-making activities in a small region may spill across regional boundaries and become a translocal or even a global phenomenon (Bennett and Peterson, 2004).

Changing Cultural Hierarchies

A second trend that is inherently related to the first is the deinstitutionalization of highbrow culture (DiMaggio, 1987, 1991). Deinstitutionalization refers to the process whereby social practices formerly taken for granted and formalized in organizations are contested. In this case, the hegemonic position of the fine arts in the cultural hierarchy is being successfully challenged, paradoxically, by artists and by highly educated people themselves. Since the 1960s, the exclusive focus on highbrow arts in school curricula has dwindled; state support for culture is no longer restricted to consecrated genres or organizations staging classical music, opera, or theater. Boundaries between highbrow and lowbrow, between serious art and popular culture, are being challenged and the apparent prestige formerly attached to highbrow culture is now being questioned. The fine arts are further desacralized in postmodern artistic practices that often combine serious art with popular elements, downplaying the artistic aura that institutionalized works of art often have (Schaeffer, 1992). The attention for poetry in mass media has declined whereas the space allocated to pop music in the popular press has increased to the level of classical music. These findings are symptomatic of the change in the institutionalization of the arts and of a redefinition of cultural hierarchies (see, e.g., Janssen, 1999: pp. 337–339). In addition, culture that used to be characterized as commercial or lowbrow is now being taught at colleges and universities and/or being staged in state-subsidized art houses. This institutionalization of nonhighbrow arts further undermines the presence of a strong, universal cultural hierarchy that champions highbrow cultural participation.

Evolutions Affecting the Field of Cultural Consumption

Democratization of Education

A number of social and societal trends related to the field of cultural consumption have also shaped the evolution of cultural participation over the years. The first trend is remarkably paradoxical. Numerous empirical studies have shown a close relationship between an individual's educational level and his arts participation (e.g., DiMaggio, 1996). And yet, despite the significant increase in the overall schooling level – as well as the average level of economic prosperity – of West European and North American populations over the past

decades, levels of arts participation have not increased accordingly. The younger cohorts, especially, benefited from the democratization of education, but their higher educational levels did not lead to higher participation levels. On the contrary, in the 1960s and 1970s, the people who participated most in highbrow arts were in their 30s, whereas in the 1990s the most ardent participants in the arts were between 45 and 54 years of age. By 2000, participation peaked for people aged 55 to 64 (Van Eijck and Knulst, 2005: p. 514). This paradox can be partly explained by the change in the content of school curricula, and hence, by the type of educational regime that no longer champions the supremacy of white, Western elite highbrow culture. Instead, other forms of cultural expression – such as low- and middlebrow cultural products – also find their way into educational practices that increasingly focus on the life-worlds of adolescents, offering pupil-oriented, 'out-of-school' literacies that fall outside of traditionally canonized authors and texts (Vacca, 2002). For example, in literary education, more popular literary genres like thrillers or crime fiction are being incorporated into courses and school curricula. Therefore, educational expansion – the growing number of people with a college or university degree and the inclusion of middle- and lowbrow culture in the curriculum – erodes the rigidity of the cultural stratification system (cf Verboord and Van Rees, 2008).

Increased Rates of Mobility

A parallel evolution that is partly a consequence of educational expansion is the steady increase in rates of social mobility. Upward social mobility, especially, has a profound effect on arts participation and, more importantly, on the symbolic value attached to the arts. When the higher social strata are infused with lowbrow tastes, there are consequences to upward social mobility on both the individual and the aggregate level. On the individual level, upwardly mobile individuals are confronted with the tension between the practices and tastes of their newly acquired social position and the cultural preferences they grew up with. Whereas mobile individuals adapt their cultural behavior to their new social environment, they do not completely dismiss the activities they grew up with (e.g., Daenekindt and Roose, 2013, 2014). On the aggregate level, social mobility causes an influx of individuals originating from different social backgrounds, each with their own characteristic cultural practices. Because of the disproportionally high rates of upward social mobility – compared with downward mobility – this mingling of cultural and artistic tastes is especially tangible among the upper middle classes. The same patterns can be seen in geographical mobility, which mixes individuals from different cultural backgrounds and brings them into contact with a wide variety of formerly local symbolic goods. In that way, the consequences of globalization are tangible in both the field of cultural consumption and the field of cultural production.

The Rise of the Cultural Omnivore

As the rigidity of both the cultural and social stratification system erodes, cosmopolitan values such as being tolerant of diversity and openness are gaining ground (Inglehart, 1990). It is in this context that the cultural omnivore is introduced as a new type of cultural consumer who – in contrast to the snob typical of Bourdieu's Paris in the 1960s – crosses the boundaries between different cultural schemes (Peterson and Kern, 1996). The idea of omnivorousness suggests that cultural capital – and the prestige associated with it – relates to practices from both sides of the symbolic boundary between highbrow and lowbrow practices. The historic shift from snobbishness to omnivorousness, or the rise of the omnivore, is considered to have taken place in the 1970s and 1980s (Peterson, 1992; Peterson and Kern, 1996).

The concept of omnivorousness – and the lack of clarity surrounding the concept, especially – has generated many questions about what it actually means and how it should be measured (Peterson, 2005). This has motivated researchers to make distinctions between different forms of omnivorousness. The best known is the distinction between omnivorousness in composition – which centers on whether or not boundaries between different cultural schemes are crossed – and omnivorousness in volume – which refers simply to the breadth of taste and not the crossing of boundaries per se (Warde et al., 2008). Another question is whether omnivorousness should be studied in a single cultural sector – for example, by focusing on the variety of preferred musical genres – or whether omnivorousness should be considered across different cultural sectors, including preferences in music, films, books, clothing style, food preferences, and so forth (Van Rees et al., 1999).

These theoretical questions pertaining to the conceptual core of omnivorousness obviously have implications for its measurement in empirical research. There is also considerable debate at the methodological level about the ways omnivorousness should be measured. For example, omnivorousness has often been operationalized as a count variable by simply summing the different preferences of respondents (Peterson, 2005). This is especially problematic considering the bias toward highbrow cultural genres in most standardized surveys. If, compared with less legitimate forms, more legitimate forms of cultural participation are characterized by a greater differentiation, it is hardly surprising that individuals from higher social strata are more omnivorous than individuals from a lower social strata. Indeed, the idea that omnivorousness is exclusively situated in the upper middle classes is being contested. Most cultural sociological studies situate omnivorousness among the highly educated, upper middle classes. However, some authors – most notably Bernard Lahire (2004) – argue that omnivorousness is present in every social stratum. His argument draws on the ideas of Berger and colleagues who argue that individuals in contemporary society are subjected to heterogeneity of socializing experiences (Berger et al., 1974; Lahire, 2011 [2001]). Because of the highly differentiated character of contemporary societies, different life-worlds of individuals are now less unified than in the past. This allows individuals to be influenced by different socializing forces. This pluralization of social life-worlds is further reinforced by the eroding rigidity of the social stratification system. Thus, the individual experience of social mobility, parental/partner heterogamy, and so forth also presents the

individual with new forms of cultural activities and preferences.

Moreover, even the depiction of the rise of the omnivore as a recent historic shift has not remained unchallenged. Trends in cultural participation reveal that the presence of the cultural omnivore is actually not that recent. Cultural omnivores were already present in the Netherlands in the mid-1950s. They increased in number until 1983, but have not increased since then (Van Eijck et al., 2002: p. 156). Also, data from Denmark reveal the existence of omnivores in the 1970s (Jæger and Katz-Gerro, 2010; Katz-Gerro and Jæger, 2011). The idea of omnivorousness as a recent phenomenon is further challenged by Lahire (2004), who argues that cultural omnivorousness – or cultural dissonance, as he calls it – is already present in Bourdieu's sample of Parisians in the 1960s. Lahire thus argues that the depiction of the rise of the omnivore as a recent historic shift "confuses a change in the model of reality (the scientific point of view on the world) with a historic change of reality itself" (Lahire, 2008: p. 182).

Implications: Current and Emerging Trends in Theory and Research

What are the implications for sociological thinking of the decreasing centrality of highbrow cultural participation and the rising importance of popular cultural goods in young people's leisure time activity patterns? Certainly, from a practical point of view, if there is a decline in arts participation in younger generations, arts organizations will have to invest in marketing-the-arts strategies to replace existing audiences. Otherwise, the audience for certain performing arts, such as classical concerts, may shrink or even disappear within a couple of decades (Kolb, 2001). Further research is needed to assess why some of the arts are holding firm despite serious competition from commercial cultural goods and why others are losing ground as a form of cultural capital among the younger generations. Is it because some forms of cultural participation – for instance, visiting art museums – appeal to the more cosmopolitan dispositions of open-minded individuals seeking intellectual stimulation more than other forms, such as classical music? Does increased competition with more home-bound, web-related activities keep youth away from ballet and classical concerts? Or are other outdoor activities such as sports and attending pop/rock concerts responsible for this shift? One thing is clear – the arts have to compete with an unprecedentedly large array of other cultural goods and leisure activities; this obviously has implications for the position of arts in society and for the symbolic value or prestige associated with them.

The Remaking of Cultural Capital

The trends outlined above do not, however, indicate that class distinctions in cultural participation are waning, and that we are entering a time of individualism in which the social hierarchy no longer structures cultural practices. Empirical research on cultural participation shows repeatedly that cultural practices are still very much socially structured, and that Bourdieu's original empirical conception of the social space needs to be updated in view of recent societal developments. Bourdieu's stress on the importance of *beaux arts* and participation in highbrow culture as essential to cultural capital may have been overstated and was limited to France in the 1960s. Recently observed patterns and trends suggest that the composition of cultural capital is being remade (Bennet et al., 2009; Hanquinet et al., 2014), and that the distinctive social force of cultural capital is increasingly made up of a passing knowledge of many cultural domains – from film to literature to sports – and of cultural schemes that range from highbrow to lowbrow. *Multicultural capital* is perhaps a more accurate term, as it signals the change from the rather one-sided dependence on the highbrow arts to a broader, more inclusive approach (Bryson, 1997). Perhaps, to differing degrees and within and across different cultural sectors, everybody is becoming omnivorous. This does not falsify Bourdieu's analytic framework as presented in *La Distinction*, as Chan and Goldthorpe (2007), for example, have suggested. Instead, this perspective downplays the role of more snobbish, exclusive forms of cultural participation as socially distinctive and meaningful resources and favors a more open, inclusive, and multicultural attitude toward cultural goods. Some studies are now finding that it is precisely the variety of tastes – instead of an exclusive interest in the arts – and the heterogeneous networks associated with that variety that are related to different life chances, such as the chance of finding a job (Lizardo, 2013). Another related issue that needs further inquiry pertains to the significance of omnivorousness. Does omnivorous taste among highly educated youth indicate a more open and cosmopolitan attitude, as some researchers have suggested (Bryson, 1997; Bryson and DiMaggio, 2000)? Or is omnivorousness only one of the many manifestations – for the young and highly educated – of the underlying trait, openness – manifestations that otherwise vary according to the period one is socialized in (see Roose et al., 2012)?

Symbolic Boundaries and Social Inequality

Future empirical research may focus on whether cultural hierarchies are actually shared between different social groups, as most empirical studies implicitly assume. However, it should also consider whether there are variations. For example, how are competing hierarchies mobilized by various groups in social conflicts and under what conditions are they being institutionalized in the educational system, for example? It is in such institutional contexts especially that symbolic violence is exerted and translated into the perpetuation of social inequality: students whose cultural participation coincides with practices from the top of the cultural hierarchy have a greater chance of educational success (see, e.g., DiMaggio, 1982). If symbolic boundaries between different forms of cultural participation are indeed waning, and if this process is reflected in institutions such as the educational system, the relationship between cultural participation and status boundaries may change. Thus, research on trends in cultural participation sheds a light on the cultural dimension of social stratification.

Cultural Policies in East Asia

Nobuko Kawashima, Doshisha University, Kyoto, Japan

© 2015 Elsevier Ltd. All rights reserved.

Abstract

Cultural policy research is a relatively new, emerging discipline of academic studies, which has particularly suffered from the lack of literature in the English language in the Asian region. This article discusses some of the common or different trajectories of cultural policy development in East Asian countries, including China, Japan, Taiwan, South Korea, and Singapore, on a few selected issues that are relatively well documented in English. It pays attention to the influence of the economic development style commonly seen in the region on the development of cultural policy in each country. Differences in political histories have also had implications for cultural policy development, particularly at the initial stage. In recent years, the creative and cultural industries policies are similarly pursued across the countries. The transnational flow of popular and media culture in the region is also highlighted. Questions for more research are suggested for future research.

Introduction

Cultural policy research is a relatively new, emerging discipline of academic studies. Although it is still debatable whether cultural policy research is a discrete area of study or a unifying theme of various disciplines, the growth of interest in this area among researchers from a wide range of disciplines such as sociology, history, and economics is manifest in many occasions. To provide concrete examples, the International Journal of Cultural Policy (IJCP) has produced 18 volumes so far, and the number of issues per volume has gradually increased from two to five in response to the growth of submissions. Associated with the above journal is an international conference called the International Conference on Cultural Policy Research (ICCPR). Since 2000, this biannual meeting has been held seven times in various places in the world. Participants get to know about it somehow and travel far for intellectual stimulation and heated discussion during the conference period of 4 days. This is quite an achievement considering that the term (and the concept) cultural policy does not sit particularly well in the English language.

It must be noted, however, that cultural policy research has been so far largely dominated by Anglophone and European thinking, with relatively little involvement of the Asian region. I myself have been one of the few contributors to IJCP from this region, but I must admit that the majority of the papers I have published are on British or Euro-oriented issues (as my postgraduate learning and early career in academia is owed to British universities). ICCPR likewise has attracted very limited numbers of participants from countries in Asia. When we do see people 'originally' from Asia, they often discuss issues of European or American cultural policy.

It is possible to suspect that one major reason why such underrepresentation of Asia in cultural policy studies has continued is related to the lack of source material and research publications accessible in the English language. There might well be cultural policy research developed in their own languages, be it in Japanese, Chinese, or Korean. This may well be the case for Spanish, French, and German as well, so we should not assume that the lack of literature available in English alone means lack of interest or the inactivity of researchers. However, there also is a feeling that Asians do not know enough about each other's cultural policies. It often happens that cultural policy researchers in South Korea are very familiar with, for example, the American way of funding for the arts and that their counterparts in Japan are knowledgeable about different models of cultural policy in Europe but know virtually nothing about cultural policy in Taiwan. In the meantime, however, cultural flows between different nations in Asia are rapidly increasing while researchers of cultural exchange pay little attention to the policies of each country in the production and distribution of culture. Such a state of the study on, and in, Asia is becoming an urgent issue. Nowadays, we may encounter speculative and sporadic comments on some specific aspect of cultural policy of a nation in the region on an ad hoc basis, but they have not yet been established as a systematic, common knowledge.

Given such a state of research, the present article on cultural policies in East Asia cannot be overambitious. It will discuss some of the common or different trajectories of cultural policy development in East Asian countries on a few selected issues that are relatively well documented in English (and in Japanese). However, for the reasons of the limited space and resources to draw on, it will not be able to suggest any analytical 'regime(s)' of the cultural policies in the region. In this way, it will be a very modest contribution of a preliminary nature to the study of cultural policy research with a geographical focus on East Asia.

A few caveats must be noted here. The article will not be able to provide country-by-country descriptions of cultural policy due to the lack of necessary data. It will not be a comprehensive overview of the countries included in the study on specific issues, either. Rather, it will be a discussion of commonalities and general trends with references to information which I have managed to gather. The countries included are Japan, China, South Korea, Taiwan, and Singapore. Geographically, Singapore is a little far from the others and could raise a question of qualification. However, for the purposes of this article, given the relative ease of access to information on Singapore and considering the similarity of economic development patterns and standards of living between Singapore and the other countries (except China), it

makes more sense for the city-state to be included. It is assumed that the similarities in economic and political structures between them will have more implications to cultural policy formation and development than geographical proximity alone.

In the following, the first part will provide some basic facts and backgrounds to cultural policies in East Asian countries. Similar features as well as differences will be discussed. The article proceeds to the second part to discuss developments of cultural policies in these countries over the years with particular attention to rationales of governments' involvement in the area of the arts and culture. The third part of the article will focus on the recent emergence of the creative industries policy. Finally, the fourth part will discuss exchange and flow of media and popular culture in the recent decades among East Asian countries and its implications for cultural policies.

Brief Description of Countries in East Asia

The five countries dealt within this article are widely different in terms of territorial size, ranging from the vast giant China to the smallest 'city-state' Singapore. The same is true of population size, ranging from 1340 million Chinese (even excluding those in Hong Kong and Macau) to a mere 5 million Singaporeans. Such differences in size are well reflected in the size of the economies, with China having recently ascended to the second largest in the world in terms of gross domestic product (GDP) overtaking Japan, and with Singapore for the smallest GDP of the five. A comparison of GDP per capita, however, will show that China lags far behind the rest, with Singapore and Japan forming the wealthy group and South Korea and Taiwan following them (**Table 1**). Overall, however, these nations boast the strongest economic successes and industrial bases in the Asian region as a whole (see Vogel, 1991 on the 'four little dragons' – South Korea, Taiwan, Singapore, and Hong Kong)

What characterizes these countries in terms of economic development is that all of them developed in a relatively short period of time. Japan, as the first of these, turned from an agricultural feudal state to a modern, industrialized economy at around the turn of the nineteenth century. After the loss of World War II, very rapid development occurred again from the 1950s to 1970s to achieve the current state of economic power. South Korea and Taiwan were former Japanese colonies, as was Singapore of Britain. After independence from the 1940s to 1960s, however, these three nations have developed industries and economies, in only three to four decades, transformed from poor, agricultural lands to globally competitive nations of wealth with a large role played by government to guide the development of the economies, and presented a miracle story to the rest of the world. The recent rise of China to the world top league of economic power is a very different story, consisting of a major transformation from a Socialist economy to a more liberal, open economy. The speed of this process is equally short, spanning from the late 1970s to today.

Table 1 Population (2010) and economy size of the five East Asian countries (2011)

Country	*Population (million, 2010)*	*GDP nominal (billion USD, 2011)*	*GDP per capita (USD, 2011)*
China	1341	5739	5 417
Japan	127	5459	45 870
South Korea	48	1014	24 900
Taiwan	23	466	20 083
Singapore	5	334	49 271

World Population Prospects: The 2010 Revision, The United Nations; World Economic Outlook Database 2012, The International Monetary Fund.

Also common to these countries is that they have been situated in the sphere of Chinese civilization and culture for centuries. China has often been a threat to the neighboring countries, who however have historically learned a great deal of civilization from mainland China. Confucian philosophy and values coming from China underline the cultures of these five nations. In turn, the people in these nations are generally characterized as self-disciplined, hard working (not minding working long hours), valuing education for children, meritocracy, and collectivism. These traits, no doubt, have contributed to the state-initiated programmes of industrialization and economic development described above.

Development of Cultural Policy

What relevance and implications do this economic transformation and the general culture of the nations described above have for cultural policy development in these states? One might guess that modernization generally results in an influx of Western culture and causes concerns for the states that their own cultures were under threat. This may well lead to speculation that economic achievements lead to ample funding for the preservation of traditional culture in response to 'over-Westernization.'

To some extent, such an imagined scenario of cultural policy development is reasonable, but the reality is far more mixed. At one extreme is China, with its strong, typically Socialist/Communist cultural policy, whereby art and literature in particular can be produced and supported only when it meets the state's political will and vision. Culture in China, in other words, has been much repressed and survived when it served the ideological cohesion of the party state (Tong and Hung, 2012). In other countries, however, the perceived threat was not unitary, while Western influences were not necessarily viewed with alarm. In Taiwan, for example, the Japanese colonial period (1895–1945) has left a major cultural influence in a wide variety of ways. While some resent it, the Japanese rule is often (and paradoxically) recalled with nostalgia, seen as a productive influence for paving the way for the postwar development that was spurred with American aid. At the same time, the elite class of the Taiwanese are migrants from mainland China who came to Taiwan with the KMT Party in the late 1940s (called the Mainlanders), who do not associate with the legacy of Japanese influence. However, their political relevance to mainland China is complex, prohibiting them from excessively asserting their Chineseness.

Such difficulty in finding a core national identity in Taiwan to develop cultural policy around is no less troubling than the experience of European cultural policy, which was generally

developed around the traditional, White, European culture. Since the 1970s, however, other cultures have started to contest this structure and claimed their places in cultural policy, too. In Taiwan, the Chinese Cultural Revitalization Committee was set up in the 1950s, but it does not seem to have been really about cultural development or Chinese values. Rather, it looks to be for the promotion of nationalistic ideology against the Communism that was sweeping throughout mainland China and for legitimizing the authoritarian rule of Taiwan that continued until 1987 (Chung, 2012: p. 341). In recent years, multiculturalism, or equal treatment of minority cultures, namely, those of the indigenous Taiwanese aborigines (perhaps of Malayo-Polynesian origin) and the Hakka people (minority Chinese who fled to Taiwan around the seventeenth and eighteenth centuries) have seen some development. Although attention to such cultural diversity is laudable, cultural policy is still struggling to ease tensions between diversity and a national identity and to respond to a growing recognition that cultural diversity itself is in constant change (Wang, 2004).

In South Korea, the colonial period (1910–45) has been remembered with hatred, indignation, and deep anger, because of the repressive nature of Japanese dominance and inhumane treatment of Koreans in Japan during and after the war. Thus, the elimination and exclusion of Japanese cultural influence has been one important aspect of cultural policy development in Korea since its independence. For example, Japanese popular culture (e.g., films, popular music, comic books, etc.) was banned in Korea until 1998 when the ban started to be lifted incrementally. Other factors that have shaped Korean cultural policy include the disruption of traditional culture by colonization and rapid Westernization, which has led the Korean government to keenly revitalize it. The cultural policy of South Korea has also developed, particularly in the years after the North–South division of 1945, as a means of building the unified nation against the Communist North Korea (Yim, 2002). More broadly, the authoritarian and militarian rule that remained until 1987 had also created a strong presence of government in the national life of culture.

In Singapore and Japan, in the early decades of struggles to move from the state of poverty (the 1950s in Japan and the 1960s in Singapore), support for the arts and culture was never on the agenda of policy makers. The national preoccupation in both countries was first and foremost to raise the standard of living for citizens by increasing the national wealth and by building the necessary infrastructure for transport, energy production and transmission, communications, and much more. Among welfare state measures, education, housing, and health care were given sufficient attention, as they would serve the quality of labor force necessary for economic development. Quality of life, distinct from the standard of living that suggests physical conditions rather than personal happiness and well being, has come onto the agenda only in the late 1980s in both countries when they acquired confidence and satisfaction with their economic achievements.

A major difference between Singapore and Japan in this context, however, is that Singapore had to build a 'nation,' which was possible with the vision of the charismatic leader Lee Kuan Yew about what the national culture must be like. Singapore as a country played down its link to Chinese culture to keep a distance from mainland China, and instead emphasized the 'local' arts and culture, hoping that cultural policy would nurture patriotism. Not to emphasize Chineseness is related to the multiethnic composition of the nation as well. The country did not choose a free enterprise economy in the Hong Kong style, but followed the course of a 'developmental state,' where strategic industrial policy is vigorously pursued by constraining and harnessing market forces by the state (Öniş, 1991), while a major concern of cultural policy has continued to be the harmonization of different ethnic groups as a nation.

In the case of Japan, similarly, economic objectives were given a high priority supplemented by state welfare only to the extent necessary to achieve these objectives. It had, however, had no need to deliberately define or fabricate national identity, as a relatively homogeneous nation and the project of nation building was finished in the late nineteenth century. The fact that the Japanese have keenly embraced American culture, values, institutions, and lifestyle, shows that there has been little fear that the American influence would destroy or taint the Japanese culture, despite the result of the war fought. Moreover, unlike Taiwan, South Korea, and Singapore, any hint of patriotism has been avoided in Japan in an effort to eradicate the remains of the authoritarian rule of the pre- and interwar years and build a democratic, free country. This was a major policy of the American occupation of Japan postwar years. Thus, whereas Singapore still has measures to monitor the 'appropriateness' of culture of citizens (see Lim, 2012 for the use of a major arts festival in Singapore) and retains censorship, Japan has had no hesitation to sign up for Western ideals and values such as freedom of expression. With little perceived danger of cultural imperialism from the West, Japan has also had the basic attitude of *laissez-faire* for the sphere of culture, a factor that in fact contributed to the weak basis of cultural policy development in the following decades.

Contemporary cultural policies of these countries, however, have tried to follow the European style, with government funding for cultural and artistic institutions such as museums, concert halls, theaters for Western classical arts (such as opera, classical music, and ballet). Issues that have been debated in European cultural policy such as multiculturalism, improving access to culture, and audience development are more or less shared by the East Asians of today, too. It is typical of East Asian nations (except China) to keenly learn from advanced nations of relevance and form similar institutions for economic, political, or social development. Japan, for example, historically (although intermittently) has sent engineers and scholars to China up to the seventeenth century or invited experts from Europe and the United States in the nineteenth and twentieth centuries for her modernization project (Kawashima, 2012: p. 295). However, simplistic emulation or importation of cultural policy from Europe has often failed to work, not necessarily because of a shallow understanding of the model but rather due to the lack of genuine commitment to the purpose of learning, namely, cultural development.

For example, South Korea has recently set up a 'British style' arts council with the aim of instigating cultural policy making at an arm's length. The new institution, however, has failed to create a public funding system independent of political interference. It has been shaped merely as a grant-making organization but its policy-making capacity has been limited

(Lee, 2012). The notion of an arts council (which could actually be anything) has attracted attention in Japan as well. The positive aspects of the British arts council have been introduced for about 20 years to policy makers by cultural policy researchers who advocate for an independent, specialist-led way of cultural policy making. Nonetheless, what has happened in the end (only in 2012) is the introduction of a few 'programme directors' and 'programme officers' (neither of which job titles has been familiar to the Japanese) in a public organization, the largest of its kind in Japan, that provides funds to performing arts organizations. The newly appointed directors and officers are expected to contribute to a strategic, specialist kind of cultural policy making, going beyond the bureaucratic, mechanical allocation of funds.

As another example, cultural policy in Japan has been developed in the late 1980s through the 1990s as an effort to improve her national image in the international arena, changing from the aggressive business people to a respectable nation with sophisticated culture and tradition. The imitation of European-style cultural policy has, however, been only superficial, as investment has heavily been skewed toward capital work, namely, the construction of cultural facilities such as museums and theaters, particularly by local government expenditure. In fact, it can be seen as a policy for public construction work, leaving very little money for creative activities and artists. Even worse, many of the personnel seconded from local authorities to these facilities knew little about the arts or had any skills required of arts management. Thus, although first class, flagship facilities for culture have been constructed all over the country in the two decades, it cannot be said that artistic performances and exhibitions made by professionals have accordingly blossomed. Unfortunately, it cannot be said either that many grass roots activities by local residents have taken place at these venues and significantly contributed to community development (Kawashima, 2012: pp. 301–302).

Recent Trend – Cultural and Creative Industries Policy

With globalization progressing in the economy, technology, information, and culture, despite differences in developments and current forms of policy making amongst themselves and from the Western models (on which cultural policy literature has focused), cultural policies of the East Asian nations have picked up a major trend of cultural policy elsewhere: the cultural and creative industries policy. This is not surprising, considering the transition of their economic bases from manufacturing and service to value added, knowledge creation sectors. As the countries prosper, their labor costs increase and they inevitably lose manufacturing bases to neighboring, developing economies such as Thailand, Malaysia, and Vietnam. Interest in the notion of the creative economy, creative cities, and the creative industries has been shown in policy discourse as well as in academia.

Singapore is also at the forefront of this policy direction. Being close to Australia and internationally minded with good English widely spoken, Singapore seems to be more flexible and quick in adapting to the global trend in policy. It has been very explicit about its ambition to become a global city, in which the cultural and creative industries are given a high profile. In fact, it has a relatively long history of having a cultural policy aligned with the development of tourism (thus economic) as well as cultural policy for noneconomic purposes like creating political unity. More concretely, during the 1980s and 1990s, sizable public funding has gone into the construction of flagship arts venues and museums, with the supporting slogan of Singapore as a global (or at least regional) hub for the arts and culture (Kwok and Low, 2001; Kong, 2012: p. 282). Located at the crossroads of the Southeast, East, and South Asian regions and in close proximity to Australasia, the slogan has not been unrealistic. As an example, long-run musicals 'imported' from Broadway and the West End are sustainable and thriving in Singapore. Together with good restaurants and countless shopping malls, Singapore can attract upper-middle classes and expatriates living in the Philippines, Thailand, and Vietnam for safe, clean, urban, and entertaining weekends. These people obviously go to Hong Kong as well for roughly the same purpose or to Macau for casinos, but Singapore competes with more contemporary artistic events of various kinds throughout the year.

Singapore in the 2000s has gone beyond this stage and articulated a policy for the creative industries with clear targets and implementation plans. Three areas have been identified as the focal sectors of the creative industries policy, namely, arts and culture, media, and design. In order to increase the contribution of these industries to the national GDP from 3% in 2004 to 6% by 2012, a number of measures have also been announced, such as attracting investment and talent to these industries both domestically and from abroad. Enhancement of creative activities in education for children and young people to nurture future creators for long-term development has also been a priority of cultural policy (Kong, 2012).

Likewise, Taiwan, in the 2000s, has been very active in promoting the cultural and creative industries (including fine arts, traditional folk arts, broadcasting and the media, fashion design, video game software as well as advertising, and so on, similar to those conceived as the creative industries by the United Kingdom government since 1997). The rationale is the same as that in Singapore: the need to convert the industrial economy that has imported electronics parts to major American and Japanese companies to a knowledge economy whereby Taiwan is no longer a downstream factory for foreign businesses. The cultural and creative industries policy is thus firmly situated alongside the biotechnology and digital content industries in the overall, long-term plan of economic transformation set out by government in 2002, and furthered in 2008 with another plan called Creative Taiwan. More concretely, the policies have emphasized the development of creative clusters and 'cultural and creative parks' (like Science Parks where research institutes of industries are clustered upon the receipt of financial incentives for relocation). Such vigorous efforts to promote the cultural and creative industries have culminated in the enactment of the Cultural and Creative Industries Development Act of 2010. Cultural policy in Taiwan in this regard, thus, has gone beyond the cabinet-level Council for Cultural Affairs (CCA) and involved ministries for economic affairs, education, transport, and much more (Chung, 2012). In the meantime, the CCA was upgraded to a Ministry of Culture

in 2012, accelerating the government's efforts to make Taiwan competitive in the world of the creative economy.

It is interesting to note that although East Asia may have been late and slow in developing cultural policy, in today's global world, the development of the creative industries policy has been parallel to that in Europe and elsewhere. Creative as an adjective modifying the name of a country or a city has been already repeated everywhere, and the same policy discourse has been heard in the international arena such as UNESCO, European Union (EU), and even in United Nations Conference on Trade and Development (UNCTAD). Despite the common policy discourse, however, there are conflicts and tensions between different interests that have varied from country to country.

In Singapore, artists are dissatisfied and see the government's slogan as being only superficial in light of the paternalistic and restrictive mode of governance in general. The practice of censorship in particular is seen to hamper individual creativity, hence the city-state's vibrancy may well be found only in a bounded, government-controlled territory (Ooi, 2010). The high expectations generally held in Singapore of efficient and quick success with measurable outputs, a feature which one may argue has helped Singapore to achieve economic success so far, may not work in the same way for the creative industries (Kong, 2012: p. 291). Another issue, which then can be linked to cultural policy for social development, is the lack of 'milieu' for cultural debates in Singapore (Kong, 2012: p. 291). It is all very well to count numbers of visitors and arts consumers (many of whom may well be from overseas) at events and celebrate their increases, but what counts in the end is that citizens of Singapore access these cultural events and exchange their views and opinions, admire or criticize the works they see. Arts, in other words, are not just to be consumed, but to be used for self-expression and social development. Such a view of cultural policy is only just emerging in Singapore, but can easily be eclipsed by preoccupation with the economic aspect of cultural policy.

In Taiwan, the cultural and creative industries policy, while predominantly economic in outlook, has started to assume cultural and social aspects as well. As a result, ironically, tension has arisen between the policy for the local and that for the global. In other words, what culture the government should promote has become a more prominent issue over the years in Taiwan with mainland China emerging as a major economic power. On one hand, more emphasis should be given to Taiwan's originality and local creativity that derive from her ethnic and cultural diversity. On the other hand, it seems that opportunities are there for the construction of a greater Chinese culture whereby Taiwanese creative industries can take advantage of the size of the Chinese supply and demand in the market of the Asian cultural economy (Chung, 2012).

While South Korea and China have also been proactive and officially proclaimed their emphasis on the cultural and creative industries policy (see Keane, 2004 on China), Japan is perhaps the least interested in or committed to this area. Like other countries in East Asia, Japan, too, has recognized the potential of the creative industries with regard to their contribution to the national economy and export and in relation to the side effects of their activities such as attracting tourists and producing positive images of the country. Japan has undoubtedly been successful particularly in animation, comic books, and video game industries on a global scale. *Animé*, the Japanese shorthand of the English word animation, has already been established as an English word in its own right, so is *manga* when referring to comic books. For example, the Japan Expo, held annually in a convention center in peripheral Paris, draws over 200 000 visitors over a period of 4 days. Mostly young people, some with their parents, would come and do 'cosplay' (again a Japanese word shortening costume play), being dressed like their favourite animé characters, buying figurines and other goods related to animé and manga, listening to famous creators from Japan talk about their works, and so on. However, the big event, which has been in existence for 13 years attracting people from whole Europe, is a private, commercial venture, and has no particular backing from the Japanese government.

The rhetoric of the creative city, which is the cousin of the creative industries policy, has gained some prominence in Japan among city and prefectural governments. This is because they have increasingly faced financial difficulties as a result of decline in traditional manufacturing and also because of political decentralization whereby local authorities are expected to find their own ways of survival without waiting for subsidies to come from the center. One solution in this context has been the policy of making cities more creative not just in abstract terms but by promoting a range of cultural activities, of not-for-profit and for-profit natures (as the boundary is unclear anyway) and leveraging such creativity for revitalizing the local economy in a sustainable manner and toward the liveability of the places.

However, when it comes to the national level of policy for the cultural and creative industries, it is outside the jurisdiction of the central Agency for Cultural Affairs, whose responsibilities include preservation of heritage, some funding for performing arts, language policy, copyright policy, and matters related to religion. The economic and industrial promotion of the cultural industries has thus largely fallen into the realm of the Ministry of Economy, Trade and Industry (METI) and to a smaller extent among other ministries and departments for local governance, communications, tourism, and the Cabinet Office. Although this is a new area for METI, officials of the Ministry have swiftly come to understand the economic features of the creative industries and identified issues for long-term development. For example, the lack of good business managers with expertise in financing, knowledge of legal matters, and skills in global marketing has been identified as a key issue. However, most of such issues are to be tackled over the long term and are not necessarily amenable to policy intervention of a short-term nature. The projects under the Cool Japan banner are in fact eclectic and arbitrary, ranging from a show of Japanese fashion in Singapore to a promotional event of Japanese food and cuisine in Mumbai (METI, 2012). Although the METI's grasp of the issues involved in the development of the cultural and creative industries is generally sound and good, the policy of Japan for the cultural and creative industries has recently waned, devoid of sustained commitment and seriousness.

Flows of Culture within the East Asia Region

Although there has been little concerted policy of promoting the cultural and creative industries in Japan domestically as well as internationally for export as described above, Japanese

popular culture, including music, television drama, consumer fashion, magazines, animé, and manga, has been widely accepted in East Asian countries, particularly in Taiwan and South Korea despite their official ban in the past in Korea. It must be noted that not all cultural products moving national borders from Japan are through official, lawful distribution. Due largely to the complexity of copyright (and neighboring right), Japanese television programmes are not easy for secondary use, including export. Rights' clearance takes a long time before the programmes from Japan can be aired by overseas television stations. In the meantime, in response to urgent demands for Japanese products by local consumers, unlawful acquisition of the Japanese programmes has been widespread, aided by the development of digital technologies (see Hu, 2004; Davis and Yeh, 2004 on VCD, the media technology widely utilized in Asian nations except Japan).

The background to such a trend toward the expansion of potential markets for Japanese popular culture is the growth in income and rise in educational levels in East Asian countries and the demand of savvy consumers for different cultures. Deregulation of content and transmission as well as technological developments in media have undoubtedly contributed to the increase in transnational flow of culture in Asia. The consumers' desire for imported products of culture has been accompanied by the urban and cosmopolitan lifestyle shared by major cities across the region so that the relatively affluent, elite class, regardless of nationalities, can easily identify with cultural products that they see as interesting and well crafted. Japan in this regard has been advantageous and successful in a wide range of cultural sectors, but since the mid-1990s, South Korea, and China and Taiwan to a smaller extent, have also emerged as cultural exporters for East Asia. At the same time, coproduction of films for theater and television is increasing between Taiwan, Korea, Japan, and China. As a result, the flow of culture within the region is now much more multidirectional, interactive, and intersecting (Iwabuchi, 2011).

Hallyu (Hanryu), or the Korean Wave, has been a successful export from South Korea to Asian countries (and beyond) of television drama and pop music. In Japan, too, starting with the success of *Winter Sonata* (a TV drama), the boom of Hallyu has been phenomenal and surprising, given that one of the most disliked nations for the Japanese has been the Koreans for decades (and vice versa). The Korean government's emphasis on their creative and cultural industries policy is often thought to be a major contributing factor to this rise in export, but there are more reasons for the sudden surge (Choi, 2008). One reason is the restructuring of the invested capital and new talents since the major economic crisis of East Asia in 1997. The lower price of programmes from Korea for importing countries like China than those from Japan and the United States has been another reason. The antagonism of China to capitalistic culture represented by that of the United States and Japan has put Korean products in a privileged position, too.

While such a transregional traffic of cultural products is, in principle, celebrated, it will be important to question whether the flow has contributed to a mutual understanding of different nations and cultures. With the rise of Hallyu, for the first time in postwar Japan interest in and respect for Korean culture is blossoming. There is some evidence as well to suggest that younger Koreans who are big fans of Japanese popular culture have positive images of Japan. Nonetheless, social discrimination against resident Koreans, who were brought to Japan in the war years and their descendants born and raised in Japan, persists. Hallyu thus even bothers people of Korean origin permanently residing in Japan who see the Korean Wave in Japan as being only superficial in the confines of commercial media culture (Iwabuchi, 2011: pp. 270–271; see also Jung, 2009 on Korean popular culture in Asia and the United States). Conventional cultural policy measures for international exchange and mutual understanding have been, however, largely separated from media and commercial culture.

It is possible to speculate on the existence of similar issues of cultural politics elsewhere, complicated by the increased flow of media culture in the East Asia region. As has been mentioned, Taiwan and mainland China experience conflicts over legitimate Chineseness. Within China alone, while her cultural policy emphasizes the promotion of traditional Chinese culture to enhance her image abroad, domestically, it has also made heavy investment into the preservation of cultural traditions of ethnic minorities. The latter policy of cultural preservation has included publishing folk songs, mythologies, and local histories as well as the renovation of architectural symbols of ethnic minorities around the country (Tong and Hung, 2012: pp. 274–275), inviting a criticism from abroad that this policy is only to build theme parks of culture without genuine commitment to and recognition of cultural diversity within the vast land.

Conclusion

This article has explored differences and similarities of cultural policies in East Asian countries. I have discussed the quick development of economies in the 'developmental state' style commonly seen in this region, which has largely left the development of cultural policy behind. The need for nation building, however, has provided a strong basis for cultural policy emergence particularly in Singapore and South Korea, but much less in Japan. Taiwan will need a little more time to work out her policy on cultural diversity while aiming to become a major player in the region's cultural economy. The influence of and historical link to China of the other nations has had different implications for cultural policy development. Taiwan and Singapore at the beginning buried their Chineseness, but the recent rise of China as an economic power is tempting these countries to forge new links with her so as to enlarge their market for the creative industries. The countries in East Asia today pursue the policy to promote the creative and cultural industries, although the degree of commitment and public investment varies. Japan is perhaps the least serious about the value of these industries, but has been very successful in exporting Japanese popular culture to the countries in East Asia. In recent years, however, the transnational flow of cultural products is no longer only from Japan, but multisectional in accordance with cultural, economic, and social globalization in general and in response to the opportunities provided by media deregulation.

As was mentioned at the beginning, given the insufficiency of descriptive data and research material to draw on, the article has only been exploratory and preliminary, leaving much to be developed for more analytical and theoretical research.

Numerous questions remain to be asked. In what ways have non-Western, traditional cultures of the region impacted upon the development of cultural polices? Does the relationship between social class and consumption of culture in East Asian countries, generally different from that of the West, have any bearing on their cultural policies? Is there an East Asian cultural policy model distinctive from those of Europe and the United States that have been much discussed in existing research? What lessons can we learn from East Asia particularly for other countries in Asia? There will be much more work to be undertaken, but all of these questions would help to advance cultural policy research, and further challenge some of the arguments in the literature on global culture that has also been dominated largely by researchers from the West. It may take a while for emerging research to mature, but promisingly, researchers from these countries are beginning to form networks for furthering East Asian cultural policy research.

Cultural Policy Regimes in Western Europe

Vincent Dubois, Université de Strasbourg, Strasbourg cedex, France

© 2015 Elsevier Ltd. All rights reserved.

Abstract

European countries have built cultural policy regimes, which reflect the patterns of national political histories and national cultural fields. These models consist in various ways of establishing culture as a policy domain, in the definition of cultural policy rationales, and in modes of organization and governance compatible with democratic standards. This triple specification process has never been fully achieved. It is being challenged in a way that questions these policy regimes and the notion of cultural policy they had defined.

Introduction

Cultural policy regimes reflect the histories of nation and state building, the institutional configurations, and the modes of government specific to each country. The cultural policy programs that most western European governments have elaborated during the second half of the twentieth century were based on the legacy of the plurisecular history of the relationships between the state and the arts, and between politics and culture. They were also linked with the general renewal of state intervention that consisted in the making of democratic welfare states after World War II. In that sense, contemporary cultural policies cannot be reduced to state patronage of the arts. They have defined their specific rationales, practices, and modes of organization, according to the national political and institutional patterns, and following their changes through time. Cultural policy regimes also reflect the patterns of the national cultural fields, that is to say their socioeconomic structure, their internal hierarchies, and the conceptions of art and culture that prevail within them. The respective importance of heritage and of the cultural industries, the polycentric or centralized organization of the arts, and the social distribution of tastes and cultural participation are part of the evolutive factors that shape specific national cultural policies which, in turn, impact them.

The evolutions of cultural policies result from the interaction between these two levels, the political and the cultural one. They mostly consist in adding new layers of institutions, orientations, and discourses rather than in radical changes, in a way that contemporary cultural policies can be viewed as the sedimentation of previous ones. As a result, a national cultural policy encapsulates the main features of the national political and cultural histories. This is the reason why cultural policy is a fascinating topic for an international comparison that brings together political, cultural, and social aspects. But this sedimentation and multidimensional aspects also complicate a cross-national perspective. Three series of questions help to identify the principles of differentiation between the various cultural policy regimes and to account for their evolution. How is cultural policy defined as a specific policy domain, and what are the issues at stake in this definitional process? What are the main rationales for cultural policy? Finally, what is the relationship between the organizational structure of cultural policy and the cultural and political issues it raises? By addressing these questions, we will shed light on the process of making a specifically 'cultural' policy and see how it is being increasingly challenged by ongoing political and cultural changes in Europe.

Defining Cultural Policy

Historical Legacies

The political uses of the arts as symbols of power are the most common features of the protohistory of modern cultural policies in Europe. Princes, lords, and monarchs all over the continent have commissioned and accumulated works of art; decorated palaces; supported artists; and funded music, theater, and festivals in order to assert their grandeur. During the Renaissance, when the private fortune of the ruling king or queen was distinguished from the public possessions of the state, this personal and private patronage progressively turned into a state affair. Specific services were created to administrate the arts. Beyond the individual pleasures and fame of the monarch, the magnificence, prestige, and moral authority of the state, in competition with the church, was from henceforth at stake.

If they share this common legacy, cultural policy regimes differ according to the various national histories of nation-building and of the making of the modern state. In countries which saw early unification of the nation and building of a powerful state, the arts and culture were directly related to these processes. France certainly is the most obvious example of this link. Linguistic unification was a means to exert power throughout the national territory, and also the condition for the early invention of a national literature, which, in return, contributed to the adhesion to a unified politico-cultural community. In that sense, the creation of the French Academy (*Académie française*) in 1635 was both a literary and linguistic contribution to the making of the French nation-state, and a political contribution to the formation of the national literary field. More generally, political and cultural centralization were joint processes. As a result, a unified state, a national culture, and the subsequent link between state and culture were historically made self-evident. On the contrary, the history of nation and state building in more recently unified countries leads to totally different consequences in terms of cultural policy regime. The history of the relationship between the arts and politics in Italy, for instance, has been the history of

 http://dx.doi.org/10.1016/B978-0-08-097086-8.10419-2

the competition between cities for several centuries (Castelnuovo and Ginzburg, 2009). The political and artistic polycentrism of the peninsula rooted in the Italian Renaissance has had long-lasting effects in terms of cultural policy. In other cases, such as Finland, the relationship between culture and politics was defined in the scope of a late and impeded nation-building, in order to promote a nationally representative art after 1860, and in order to create a sense of national community during the first decades of the twentieth century (Sokka and Kangas, 2007).

The political uses of culture can also result in illegitimate legacies that have hindered the founding of cultural policy regimes in the contemporary era. This has occurred in countries in which authoritarian and fascist regimes have manipulated the arts and culture. The main example is Nazi Germany, during which arts censorship and political propaganda through culture was stronger than anywhere else in Western Europe, with a direct impact in terms of reluctance toward a state-driven cultural policy in West Germany after World War II. To a lesser extent, a negative cultural legacy has impeded the making of democratic cultural policies after authoritarian regimes in Italy, Spain, and Portugal. Contemporary cultural policy regimes result from these various national histories, which have led to various notions of viewing culture and its political aspects, and provided various legacies in terms of institutions, types of funding, and modes of organization.

Specifying a Policy Domain

The definition of a cultural policy does not, however, only consist in these historical legacies. Besides 'implicit' cultural policies, namely the wide set of public decisions and programs which have cultural impacts even if they are not conceived and presented as pursuing cultural goals (Ahearne, 2009), explicit and specific cultural policies have been defined as such, in most European countries, from the 1960s onward. National and local governments have created a new policy category (Dubois, 2012), bringing together new functions, previous forms of public support for the arts, and closely related policy domains. However, the idea that culture is per se a legitimate field for public policy is still diversely appreciated from one context to another. If the term 'cultural policy' itself is common in the French political discourse since the 1960s, it has rarely been used at the European Union level, for instance.

What cultural policy includes is also variable in time, and from one country to another. The core commonly includes historical heritage, support of professional artists, and traditional cultural institutions such as libraries, museums, theaters, and concert halls. Quite a few other sectors or issues variably complement it, such as popular, regional, or migrant cultures, language, sports, media, leisure, after school and social activities, cultural education, or the amateur arts. What cultural policy includes or excludes in a specific national and historic context is not only a matter of bureaucratic organization, it partly reflects the boundaries of the legitimate domain for public intervention in a given society. It also reflects the definition of culture which prevails and which is promoted by public authorities.

Cultural public policy participates in the classification process that separates art from nonart, or at least valuable from less valuable art (DiMaggio, 1987). As Heikkinen shows in the case of Northern Europe, the administrative categories used to classify art and artists vary from one country to another according to the interaction between the state and the artistic field specific to each national context (Heikkinen, 2005). The extent to which public authorities determine these classifications or simply follow those defined by the art market is a good indicator of a cultural policy regime, since it reveals the relative weight and symbolic authority of the state and of the market in cultural affairs. With strong national differences, European cultural states gained power in this respect from the 1960s to the 1980s, but the market has become dominant again in the following period.

Beyond classification in art, the definition of culture in cultural policy plays a more general symbolic role in society. The core of the cultural policy domain basically corresponds to the legitimate definition of culture, that is to say the culture of the elite (Bourdieu, 1984). The extension of this domain then consists in the inclusion of the culture of other social groups, which raises the issue of their symbolic status. We can think here of three main cases. In Western Europe, as opposed to the Eastern part of the continent, the culture of the working class has generally been initially excluded from the field of state cultural policy, but promoted by social movements and political organizations, such as the Communist party. Declining traditional aspects from working class cultures have later been taken into consideration, mainly in the perspective of preserving their heritage (Dubois, 2011a). Regional and local subcultures are a second example. They have long been promoted in federalist and highly decentralized countries, where they represent the cultural counterparts of political claims toward the national level. Their partial recognition participates in the highly debated symbolic redefinition of the nation in unitary nation states. The third and currently prominent example concerns the cultures of immigrants. The inclusion of these cultures in the field of public policy serves as a symbolic tool for the inclusion of immigrants in society. This, again, is highly debated in many countries, including Germany, where the *multikulti* orientation of *soziokultur* programs, initially promoted by activists at the local level, has been included in official national policies from the 1980s onward. It is also debated in France, where the reticence emanating from the tradition of a unified Republican political and cultural model limits the development of such programs (Kiwan, 2007).

An Increasingly Uncertain Domain

Although the borders of cultural policies have not been strictly defined in the past, they are probably even less so today. The specification of culture as a policy domain currently faces three principal challenges. The first one is not entirely new and concerns the redefinition of culture. As long as a restrictive and elite notion of culture prevails, the outlines of cultural policy remain quite easy to draw. They broadly correspond to the field of art and heritage, to which are added educational and social aspects. But the invention of new artistic genres or disciplines (such as video art or street art, for instance) and the questioning of the notion of art by postmodern artists resulted in the constant redefinition of the borders of art itself. In addition and sometimes in relation to these redefinitions, the narrow

perimeter of culture as legitimate art and the elitist conception it entails has been contested at least since the end of the 1960s. The spreading of a more comprehensive and anthropological notion of culture and the claims for cultural recognition by minority groups have participated in making the definition of culture (and then of cultural policy) problematic from a social and political point of view. A second challenge results from the changes in the access to culture. As long as this access was mainly provided by institutions, such as theaters, or by media that could be directly regulated by public agencies, such as radio and television, the territory of cultural policy could correspond to the addition of these institutions and media. The advent of the Internet, which now plays a major role in the diffusion of cultural goods, and is far more difficult to regulate, leads to the fact that a substantial part of culture now is out of reach from traditional cultural policies. Finally, new ways of considering the borders of the cultural field have challenged the definition of cultural policy. Since the 1990s, the idea of creative industries and of a creative economy has emerged in the Anglophone world and has experienced a great success in Europe, starting with the United Kingdom (Hughson and Inglis, 2001). The notion of creative industries overlaps with the notion of cultural industries, although it is definitely a broader one. It adds design, advertising, fashion, software, computer games, etc., to the more traditional sectors of publishing, television, film, or performing arts. The notion of creativity tends to replace the notion of arts and culture in policy discourses, at the EU level and to a lesser extent in national and local governments. This evolution tends to replace cultural policy as a specific domain with a policy promoting the new model of a creative economy, in which culture is included, but diluted.

Specifying Cultural Policy Rationales

The Original Trilogy: Heritage, Artistic Creation, and Access

Cultural policy regimes in Western Europe have been built on three principal shared policy rationales. The first one pertains to the preservation of artistic and historic heritage. This is basically acknowledged as a legitimate state function, even in noninterventionist liberal contexts. In most European countries, heritage is generally regarded as national heritage, which is closely related to the national history and identity. Heritage protection corresponds to the model of a regulatory state, which establishes legal rules in order to prevent the loss of what is defined as public goods. It is an example of the previously mentioned classificatory role of cultural policy. In addition to legal protection, costly heritage maintenance requires funding that private individuals or organizations generally cannot afford by themselves. This financial issue has justified public expenses for culture over the two last centuries. In countries such as Italy, for instance, private foundations have nevertheless traditionally played a key role in the preservation of heritage. This is now a general trend in European heritage policies which questions the oldest legitimate basis for the intervention of public authorities in cultural affairs.

A second basic rationale for contemporary public policy is support for artistic creation. Even though there are similarities and continuity between the two, this support differs from the ancient model of state patronage. The manipulation of the arts as symbols of political power is no longer the major aspect of commissioning and subsidizing artists. This support is primarily based on the idea according to which the market is not sufficient to promote artistic creation and innovation. In contemporary visual arts or in literature, we could say that public support of creation is currently ancillary to the art or the publishing markets. But in contemporary art (i.e., experimental music) or to a lesser extent in theater, private demand and consumption could not suffice to fund creation. Cultural policy then aims to provide the conditions for this creation to exist. It can more ambitiously aim at preserving part of the field of artistic creation from the necessity of profitability, which in other words means enabling the implementation of the specific 'rules of art' in lieu of letting the economy rule the art (Bourdieu, 1995). This ambitious rationale for cultural policy raises, however, the issue of the extent to which public bodies should make artistic choices and, by doing so, should promote certain aesthetic and moral values above others. In order to avoid the specter of 'official art,' democratic cultural policy regimes have created forms of delegation of artistic judgment, through experts, commissions, and cultural organizations comanaged by officials and artists. This delegation of judgment is a major distinctive feature of these regimes.

The relationship between democracy and culture is also central to the third main rationale for contemporary European cultural policies, that is, equal access to culture (Vestheim, 2012). The idea of the necessity for the people to access education, arts, and culture so as to gain individual autonomy and to become able to exert citizenship dates back to the Age of Enlightenment. It was translated into a policy goal and has become a guiding principle for cultural policy in the postwar period. We could say that it was the cultural component of the making of European welfare states, which added cultural entitlements to social rights to achieve a more equal and inclusive society. The notions of cultural democratization and equal access to the arts were all the more successful insofar as they could easily bring politicians and cultural actors to a common ground. They were consequently central in the legitimization of modern public cultural policies differentiated from past forms of public support to the arts, with some exceptions such as Greece, where cultural policy focused on heritage and disregarded the democracy dimensions (Zorba, 2009).

These general notions, however, comprehend various if not contradictory orientations. The civic perspective of autonomous individuals able to participate in community life thanks to culture meets educational policies. The humanist and somewhat paternalistic perspective of pushing the lower classes toward greater participation in highbrow culture pertains to a paradoxical form of elitism grounded on the idea that only the upper educated echelon knows what is real culture and what is good for the people. Conversely to this top-down approach, the claim for cultural democracy consists in the desacralization of elite culture and in the achievement of cultural diversity forms that envision democratization from a bottom-up perspective (Bonet and Négrier, 2011; de Jong, 1998; Saukkonen and Pyykkönen, 2008). The balance and combinations between these orientations varies in time and space. A legitimist and elitist approach to the dissemination of

culture in society prevailed until the late 1960s. From then on, this model has been contested, but it has not been entirely replaced by an alternative model. Current cultural democratization policies and discourses actually articulate different strata that may be logically incompatible but are combined in practice. Generally speaking, the legitimist approach remains important, as it reflects the predominance of elite cultural institutions in European cultural policies, but is nuanced by programs that are conceived in a more participatory way, or more oriented toward the promotion of cultural diversity.

From the Diversification of Goals to the Noncultural Rationales of Cultural Policy

This original trilogy sets the basis for policy objectives proper to cultural policy and that aim at specifically cultural purposes. This should not, though, be taken for granted. First, these core rationales have always been combined with other policy goals (Gray, 2009). The search for national prestige and influence at the international level is an example of the link between cultural policy and diplomacy. Among other things, most European governments have established a network of cultural centers abroad, such as the British Council or the Goethe Institut. The making and promotion of collective identity through culture lasts long after the early period of nation-building, as we have seen after the German reunification in 1990, or in the renewal of political uses of history in Spain, France, or even at the EU level during the past two decades. In addition, public cultural policies have a wide range of specifically social policy goals, from urban regeneration to the supervision of idle youth in deprived neighborhoods, from the empowerment of disabled persons to the regulation of ethnic and cultural diversity and to the alleviation of social exclusion (Belfiore, 2002). Last but not least, culture is considered as a means to achieve economic goals. Beside cultural concerns, festivals, museums, or historic buildings are envisioned and publicly funded qua assets in terms of touristic attractiveness. Cultural organizations and training in cultural professions are also supported because the culture is a dynamic sector in terms of employment.

Second, each of the three main objectives specific to cultural policies is challenged in various ways. The protection of heritage is nowadays less than ever a monopoly of the public sector. In addition, the narrow definition of heritage as the legacy of celebrated works of art and buildings from the past has progressively been replaced from the beginning of the 1980s by a much broader one, a potentially never-ending list, which includes industrial sites, folk traditions, or local dialects. This broadening accounts for the changes in the relationship of Western societies to their past. It also transforms the role of heritage policies, which, more than ever, 'invent' rather than only protect heritage. All of this questions the self-evidence of heritage preservation as a public policy function. In times of economic crisis, public support of artistic creation is questioned, especially when this creation hardly meets any demand from the audience. On the other hand, the role of public agencies is weakened by speculation in the art market and the increase in prices. Cultural democratization, that is, the prominent objective and legitimizing discourse in the development of contemporary cultural policies in Europe, has also lost an important part of its strength as a political and cultural guiding principle. The contestation of a unique and universal notion of culture, from countercultural movements in the late 1960s to the current promotion of cultural diversity, has weakened the belief in the legitimist cultural model on which cultural policies have been founded. The mixed results, if not the failure of several decades of public cultural policies in the reduction of social inequalities in cultural participation, have also shaken the founding myth of cultural democratization. Moreover, the huge development of ways to access culture, television, and subsequently the Internet, has increasingly competed with cultural policies, mainly focused on traditional institutions such as libraries or theaters.

Finally, the balance between strictly cultural objectives and noncultural goals has moved toward the latter orientations. Conversely to the specialization and specification processes that started in the postwar period and resulted in asserting cultural policy goals for the sake of culture, public intervention in cultural matters is at present increasingly assigned noncultural purposes, among which economic ones prevail. Public cultural expenses are gradually viewed in terms of investments from which economic impacts are expected. This is the case even in countries with a strong cultural policy and welfare-state tradition, such as France or Northern European countries (Mangset et al., 2008). The successful notion of creativity has become the keyword of current cultural policies. This makes the arts lose their specificity by linking them to entertainment and by viewing them as part of a fuzzy ensemble (the creative sector) defined on an economical rather than on a cultural or aesthetic basis. As a result, national cultural policies change from 'intrinsic' to 'instrumental' (Orr, 2008; Vestheim, 1994), jettisoning part of their cultural rationales in favor of economical ones, and contributing to a new form of 'cultural capitalism' (McGuigan, 2004). This is ironic when we remember that contemporary European cultural policies have partly been conceived to protect arts and culture from the rules of the economic market. At the EU level, instead of developing proper cultural policies, the addition of 'cultural dimensions' to economic and social policies ('mainstreaming') frames and defines the criteria for cultural projects according to the rationales of economic and social programs (Gordon, 2010). This illustrates the cultural and political implications of the organizational structure of cultural policy.

Organizing Cultural Policy in Europe: Structures and Governance

Social, Political, and Institutional Settings

Beyond its technical aspects, the organizational structure of cultural policy raises the question of who is legitimate to define collective cultural orientations. The general public is usually not part of the cultural policy making processes, although there have been some recent attempts to include satisfaction of the citizenry in the policy evaluation criteria. The organized interaction between public officials and professional representatives of artistic sectors is far more important, and there are examples of comanagement, such as cinema in France, or in the Nordic countries. Public intellectuals can be influential, which is also an indicator of cultural policy as an issue in the public debate

(Ahearne and Bennett, 2007; Burns and van der Will, 2006; Dubois, 2011b).

The organizational structure of cultural policy also raises the question of how the sensitive and highly symbolic matters of arts and culture should be governed. In liberal democratic regimes such as Western European states, the mode of governance is required to exclude any possible resemblance to the authoritarian model of arts and culture controlled by the state apparatus. This is a strong political constraint for the institutions that elaborate, implement, and embody national cultural policies. Two models are generally considered to account for Western European cultural policy (Hillman-Chartrand and McCaughey, 1989). The 'architect state' relies on centralized ministries. In this case, a specific department for culture within the national government concentrates a predominant part of the financial, political, informational, and symbolic resources for cultural policy making. Such a department asserts the role of the state in culture and is the main center for institutional and symbolic power in this domain. This type of interventionist state involvement characterizes France, while most governments adopt a less directly activist role. The latter represents the ideal type of the 'patron state,' dispensing funds through quasi-independent institutions. The Arts Councils in Great Britain exemplifies a public body which operates at 'arm's length,' i.e., in relation with the national government but outside its departmental internal structure. This is supposed to protect from a possible excessive political leadership.

While this dual opposition helps to set the landscape of national cultural policy structures, it is, of course, not sufficient. The actual governance systems have never been as simple as that. They also have experienced important changes, such as the relative decline of the French ministry for culture, or the increasing control of the British government and its department for media, culture, and sports over the Arts Councils. In these two countries as elsewhere in Europe, governments increasingly use tax policies to promote private patronage, which refers to the third type, a 'facilitator state,' of which the United States provides an example. There is neither a strong national ministry for culture, nor a strong arts council in Germany or in Italy, whereas there are both in the Nordic countries (Mangset et al., 2008).

Whatever the case, the previously mentioned political constraint in democratic regimes results in the fact that there is no institutional system in contemporary Western Europe in which there is a sole decision and bureaucratic monopoly on culture. As a policy area, culture is shared between infranational, national, and supranational policy levels, with strong connections to the nonprofit private sector (Burns and Van der Will, 2003; Stevenson et al., 2010). This multilevel complexity characterizes all European countries, including those usually regarded as having a high level of state centralism such as France, where the national government is responsible for less than 50% of the total of the public budget for culture, and where all the politico-administrative levels (municipalities, intercommunity structures, departments, and regions) have jurisdiction over culture.

This is, however, far from avoiding jurisdiction conflicts and debates about which level is most legitimate and best suited to take care of cultural affairs (Dubois et al., 2012). While such conflicts and debates occur in any kind of political and institutional system, they are of particular importance in the countries where infranational and national governments compete for political legitimacy. This is clearly the case in Spain, where this competition is a factor in the apparent inconsistency of the multilevel governance of cultural policies, and where diversity results in the nonexistence of a formal Spanish model of cultural policy (Bonet and Négrier, 2010). Although Spain is an extreme case, all European countries experience to various extents comparable dynamics between center and periphery, and decentralization has generally been increasing for the last three decades.

Funding Culture

Cultural policies are often identified with public financial support for the arts and culture. This is obviously simplistic, since they use a wide range of policy tools, from market regulation to organizational reform, but underlines that funding is a key issue. To some extent, cultural policy regimes then consist in cultural funding modes. These regimes are difficult to compare. A rough approximation shows that the public expenditures for culture range from around 0.5 to 2.5% of the total of public budgets of Western European countries in 2010–11 (Council of Europe and ERICarts, 2012). This does not indicate much since all of them mix various financial aspects, which are almost impossible to assess in a single figure (Alexander, 2008). In addition to the most direct forms of funding, that is to say public budgets for state-controlled institutions, such as public libraries, and subsidies granted to individual artists or nonprofit arts organizations, there are many other indirect forms, such as social security benefits paid to artists, support to private companies in the cultural industries, or tax incentives for the patronage of the arts. This strongly varies from one country to another. A general tendency, however, is the predominance of support to art institutions. More precisely, European cultural policies have to a large extent consisted in creating new art institutions in order to extend the supply of culture. This plays a direct role in the current financial crisis of cultural policy whose budget is widely absorbed by the costs to run these institutions. This crisis is all the more acute as that stagnation, if not retrenchment, comes after decades of increase in the cultural public budgets.

This has changed the debate on who is to pay for culture. In the period of development of national cultural policies, which coincided with a general growth of public budgets, national states and local authorities have increased their cultural expenditures, sometimes considerably. Not only because of financial difficulties but also because of neoliberal policies, governments have looked for new financial sources, including the national lottery in the United Kingdom in the mid-1990s. The general trend toward decentralization, which had previously accompanied the global development of cultural policies, is now often related to the withdrawal of the national governments. As a result, cultural policies increasingly appeal to the private sector. This brings European cultural policy regimes in some ways closer to the US model in which cultural organizations have to raise money. Tax incentives for the private patronage of the arts are now a common feature of public policies for culture in Europe, where they sometimes are more favorable than they are in the

United States. This does not amount to the end of European cultural policy regimes, but is part of the redefinition process they are experiencing.

Cultural Production in Networks

Katherine Giuffre, Colorado College, Colorado Springs, CO, USA

Abstract

Cultural production occurs in a field which is shaped by both cooperation and by conflict and competition. The field is a network of relations among producers and the structure of network ties affects cultural production at multiple levels – from individual to group, industry, and place. Important network characteristics are density, diversity, structural holes, and small world structures.

Relational Thinking vs 'The Lone Genius'

Beginning in the Renaissance, there was a shift in conceptualizing the way in which cultural production occurs. While artists had been considered craftsmen during the early Renaissance – members of guilds, trained as apprentices, producing items to the specifications of detailed contracts, working on a wide variety of objects in a collaborative workshop setting – the later Renaissance saw the emergence in Western culture of the idea of artist as a 'lone genius,' pursuing a singular, individual vision, and working in isolation from others. This conception of the lone genius received a further boost during the Romantic Era when it became the dominant cultural understanding for the way in which art was produced. However, current social scientific research into cultural production shows that art (including both visual and performance art, creative writing, music, fine art, folk art, and popular culture) is produced in social settings and that artists and other cultural producers are embedded in social networks which affect cultural production in a variety of ways.

Social network analysis is a useful method for implementing the relational thinking that is opposed to the romantic 'lone genius' notion of cultural production. The idea that social networks play an important role in individual lives and in social processes has been part of the sociological tradition since at least the mid-1800s, but only in the mid- to late-twentieth century did the metaphor of the 'social network' become transformed into actual social scientific methodology capable of sustaining relational analysis. Harrison White and others developed not only the tools by which network analysis could proceed, but also the theoretical underpinnings for an analysis centered on the social relations among the actors in a system as its primary focus. Pierre Bourdieu's theories (especially of the 'field' (*champ*)) provide key conceptions of relational thinking with regard to cultural production.

Bourdieu's Field as a Space of Relations

Bourdieu argues that cultural production happens on two levels – on the level of the object, performance, etc. and on the level of the understanding of the object as art. "Given that works of art exist as symbolic objects only if they are known and recognized, i.e., socially instituted as works of art and received by spectators capable of knowing and recognizing them as such, the sociology of art and literature has to take as its object not only the material production but also the symbolic production of the work, i.e., the production of the value of the work or, which amounts to the same thing, the belief in the value of the work" (Bourdieu, 1983: p. 318).

Neither the production of the work nor the production of the understanding of the work happens in a vacuum – they happen inside the 'field of cultural production' which is a space of relations and of struggle. The field is "a structured space with its own laws of functioning and its own relations of force … Its structure, at any given moment, is determined by the relations between the positions agents occupy in the field. A field is a dynamic concept in that a change in agents' positions necessarily entails a change in the field's structure" (1993: p. 6).

The field is defined by the objective relations among the actors (which can be persons, groups, institutions, and so on). Actors' positions are determined relative to one another. Moreover, the field is hierarchical with regard to power and the actors are constantly struggling to improve their positions vis-à-vis each other so as to legitimize certain positions (their own, principally) and delegitimize the positions of their rivals. This means they endeavor not only to gain prestige and power for themselves, but also, more importantly, to be able to control the power to define legitimacy in the field.

The simultaneous struggles of all of the actors in the field to achieve positions of legitimacy (dominance) create a dynamic system where any individual position is always dependent on the distribution of all other across the entire field. Successful actors in the field of cultural production accrue symbolic (as opposed to economic) capital and position themselves at the autonomous (as opposed to heteronomous) pole of the field. This creates an 'economic world reversed' where those who amass economic capital lose status relative to those who amass symbolic and cultural capital.

Art Worlds

The concept of the 'art world' also emphasizes the network of the relations among actors. According to Becker, "Art worlds consist of all the people whose activities are necessary to the production of … art. …The same people often cooperate repeatedly, even routinely, in similar ways to produce similar works, so that we can think of an art world as an established network of cooperative links among participants" (1982: pp. 34–35).

As with Bourdieu, Becker recognizes both the material and the symbolic production of art works. The inner circles of different parts of the art world share understandings about meanings and conventions which separate and distinguish them from more peripheral members.

Becker emphasizes cooperation, but there is also conflict and competition, especially around issues of legitimacy and of change. Cultural producers compete for notice and legitimacy. Moreover, those who are most likely to innovate are those whose ties to the established art world are either weakened or never existed in the first place. This fits with more explicitly network analytical conceptions of innovation and creativity having to do with network structures and characteristics, especially ideas about density, structural holes, and small world structures.

Network Structure and Creativity

Network density is a measure of the proportion of possible ties which are actualized among the members of a network. Dense social networks, especially coupled with strong boundaries segregating the group from others, can enforce communal norms so that social pressures for conformity can inhibit creativity, which necessarily contains an element of deviance. Small dense networks may develop 'groupthink' where conformity of ideas is highly valued and normatively enforced. This inhibits creativity within the group.

Social scientists (e.g., Jehn, 1995) have found that conflicts among the members of groups may increase performance of nonroutine tasks. Nemeth and Nemeth-Brown (2003), Milliken et al. (2003), and Strasser and Birchmeier (2003) all similarly argue for the value of dissent and diversity as stimulators for creative thought in group settings. Other research (Ng, 2001) shows that those individuals who conform to group norms tend not to engage in the often divisive deviance necessary for creativity. Moreover, when McLeod et al. (1996) studied groups composed of all Anglo-Americans and groups composed of mixed ethnicities who were asked to brainstorm solutions to a provided problem, they found that groups composed of ethnically diverse members produced more solutions and solutions of higher quality than did the racially homogeneous groups. But this is only true up to a point. Too much diversity can eventually have a negative effect on group functioning when groups are unable to cohere sufficiently to collaborate at all.

Fuchs (2009) makes a case for analyzing cultural production networks with regard to actors and processes in the core of the network vs those in the periphery. Fuchs argues that the core of the network becomes closed and ideas there become the network's 'common sense.' He writes that, "Common sense is slow to learn, resistant to change, and unwilling or unable to make any genuine discoveries" (2009: p. 358). This is in contrast to the actors in the periphery, which are more loosely coupled – that is, less dense – and therefore "accommodate more controversy and contingency; their mood is more playful and their mentality more open to change, alternative interpretations, and innovations" (2009: p. 360).

Density – as a mechanism for normative conformity within a network – is not the only important structural factor in fostering creativity. Small subcultures may develop strong norms, but people who are positioned to bridge the gaps among these groups enjoy the creative benefits of being able to synthesize the information into new forms. This is Burt's (2004) argument about 'structural holes.' He argues that social forces such as homophily and interpersonal balance work to encourage individuals to build network ties with like-minded others. This leads to the formation of groups of tightly knit actors who share similar dispositions, etc. These groups are relatively separated from other groups that have different sets of dispositions, norms, and knowledge. The absence of ties among these groups form structural holes – that is, gaps in the social structure where network ties could exist, but do not.

Burt's main claim is that "people who stand near the holes in a social structure are at higher risk of having good ideas" (2004: p. 349). Because there is homogeneity within cliques, deviants are more likely to exist on the fringes of the cliques and are more likely to have ties with others who are outside the clique. The important factor is the dissimilarity of the others to whom they are connected. Burt argues that "People whose networks span structural holes have early access to diverse, often contradictory, information and interpretations, which gives them a competitive advantage in seeing good ideas" (2004: p. 356). He notes, "This is not creativity born of genius; it is creativity as an import-export business. An idea mundane in one group can be a valuable insight in another" (2004: p. 388). Burt shows that people who act as brokers across structural holes are more likely to have innovative ideas and are more likely to have their ideas recognized as valuable and to be rewarded for those ideas.

The concept of structural holes fits nicely with the idea of 'small world structures.' Small world structures (Watts and Strogatz, 1998) are a further development of Stanley Milgram's small world studies. Milgram (1967) investigated the phenomenon of two people meeting by chance and discovering that they have an acquaintance in common. Milgram found that the chains of interpersonal connections linking randomly chosen individuals in the United States had a much smaller number of steps (about six) than originally hypothesized. This finding allowed Watts and Strogatz to develop a model of social structure where most ties are dense and local, but a few long bridge ties between far-flung people dramatically shortened the chain length of interpersonal ties between everyone in the system. This is the small world structure where small groups of tightly knit actors are connected with each other through a few ties which bridge the gaps between them. With regard to the production of Broadway musicals, Uzzi and Spiro argue that "a small world network governs behavior by shaping the level of connectivity and cohesion among actors embedded in the system. … The more a network exhibits characteristics of a small world, the more connected actors are to each other and connected by persons who know each other well through past collaborations or through having had past collaborations with common third parties. These conditions enable the creative material in separate clusters to circulate to other clusters as well as to gain the kind of credibility that unfamiliar material needs to be regarded as valuable in new contexts, thereby increasing the prospect that the novel material from one cluster can be productively used by other members of other clusters" (2005: p. 449). In small world structures, there are dense local groupings, but also bridge ties

that connect the groups efficiently. Uzzi and Spiro find that the small world structure is beneficial to Broadway musicals (both in terms of financial and artistic success) but only up to a point. Once the entire network becomes too connected, the distinctive individuality of the various groups diminishes and problems of 'groupthink' and lack of diversity set in. Collaboration has to be structured so as to avoid conformity.

Farrell (2001) defines 'collaborative circles' as groups of cultural producers who develop a shared vision of their work. His argument is that the attribute of personal creativity is socially produced. Cultural producers have creative ideas with other people that they would never have on their own because of the social support and critical feedback that producers get from others who share their vision. Farrell argues there are specific ways that successful collaborative groups are structured which make them fertile ground for the flowering of creativity and there are specific roles that group members need to fill to make that happen. Successful collaborative circles are formed in opposition to existing power structures and members are initially drawn from people who are marginal to the mainstream art world. It is this initial opposition that draws the group together. Members often find supportive others within the circle, but also find contentious and combative debates among circle members which function to sharpen the group's vision. They also tend to develop increasingly radical ideas as the members goad each other on and the circle develops into something similar to a deviant youth subculture.

Collaborative circles are often most useful to cultural producers in the earlier stages of their careers when the artists are formulating their distinctive vision. As the artists' careers progress, however, collaborative circles often disband.

Careers

Artists' careers are also built around social networks. Artists (who often work as freelancers connected to specific projects) must make connections with other art world members (such as gallery owners, book publishers, film producers, etc.) in order to make a living from their work. These networks of connections are some of the relations that define the field of cultural production. Artists' relations with others in the field define their place in the hierarchy and their position relative to the autonomous or heteronomous poles of the field. As cultural producers make and break connections with others in the field, the field is continuously re-shaped. An individual's career becomes a trajectory through the field – that is, a series of positions relative to others in the field and demarcated by distance from the poles of the field. Cultural producers engage in strategies (such as succession or subversion) in the field in an attempt to construct career trajectories that are beneficial to themselves. This involves strategically making (and breaking) ties with other actors in the network as that network is continuously changing form over time. Despite this inherent flux in the shape of the field, actors do manage to carve out career paths. Although the specific actors who occupy the positions change, the types of positions available in the field (e.g., dominant or dominated) has some stability.

Faulkner (1983) documents how Hollywood studio composers build careers out of networks by moving from project to project. A composer of music for Hollywood films "competes in a marketplace for projects and in a network for access to owners and controllers of those projects. It was immediately apparent that access breeds success, so there is continual pressure toward monopolization of work" (1983: p. 22). Faulkner found that those composers who could achieve centrality in the network of relations in the industry could maintain a successful career. This happened by strategically making and breaking personal ties with others in the field. This is true for other types of artists as well. Fine art photographers, for example, succeed in the art world by building strategic social networks with other artists and galleries (Giuffre, 1999). Especially useful in this case were broad-ranging networks of weak ties which could connect individual photographers with a variety of others. This ensured them career continuity in a volatile world of many short-lived galleries.

Looking at writers and their connections to literary magazines, de Nooy (2002) pushes this model much further. The prestige of the writers and of the magazines is dynamically linked, each influencing the other and each pursuing strategies in the field through the relations that they make, break, or avoid with other actors. De Nooy found that strategies of 'status preservation' (as opposed to 'status enhancement') were the chief operations in the field. He found that, "the flow of authors toward prestigious magazines seems to be restricted by selective admission, which is probably exerted by the editors of these magazines" (2002: p. 165). This fits with research about the importance of gatekeepers who work to limit access to higher levels of the art world by those actors with lower prestige. Overall, de Nooy's work offers support for the "dynamic and relational character of field theory" (2002: p. 164).

Looking at writers' networks in the early modern period in Korea, Jun and Park (2009) found that writers with high network centrality were more likely to be productive and to be included in the canon. In their research, gender intersects with network form. Jun and Park found that female writers had significantly smaller diameters of their networks – that is, "they belonged to less various groups of writers than their male counterparts" (2009: p. 27) – and were consequently disadvantaged by limited network resources. Becker notes, "You need ability, then, for free-lance success, but it is not enough. Successful free-lancers also need a network of connections, so that a large number of people who might need their services have them in mind, and in their telephone book, to be called when the occasion arises. Reputation helps" (1982: p. 86).

Reputation is built up through networks. Networks act as gatekeepers to desirable parts of the art world. Ridgeway (1989) argues that groups of artists – 'movement circles' – play a crucial role in both supporting and allocating access for young artists. For example, young artists need introductions to galleries that more established artists can provide. This is the role of the movement circle in helping artists developing reputations with other artists – the underground reputation that was critical to getting their first gallery representation. "These young artists perceived the necessity of extending contacts in order to achieve success to the critical centers of the art community and to the market, knowing such acceptance was a crucial link in the process of their own acceptance. The importance of developing an 'underground' reputation was clear. 'Artists initiate styles. (Dealers) bring to the public

guys who are already there. When the Minimalists, say Andre, Judd, LeWitt, you know – put Ryman there – they had been making art for a long time. By the time Virginia (Dwan Gallery) picked them up, they all had underground reputations. All of them'" (Ridgeway, 1989: p. 212).

More established artists acted as gatekeepers by giving younger artists introductions to collectors and galleries. "Few artists ever find their way into a major gallery without such an introduction. The majority of these artists attained their first gallery recommendation from other artists" (Ridgeway, 1989: p. 217). This is especially crucial for art world actors who are attempting a strategy of succession in order to gain a dominant position in the field of cultural production. Moreover, this is true not only in the fine arts, but in culture industries in general, where products, from painting to pop music, must pass through gateways.

Because there is an oversupply of cultural products relative to demand, distributors filter products which make it to the market. This may be a stepwise process where a cultural producer must pass through several successive gatekeepers, risking rejection at each step before eventually reaching the market. Each of these steps involves successfully making network connections with the different gatekeepers and is often facilitated by other network members.

Accominotti (2009) finds that those painters who were part of artistic movements and were embedded in networks of like-minded others had creative peaks in their careers during the time that they were engaged in the movement. Being embedded in an artistic movement network became an important part of a subversive strategy in the field of fine art painting. Accominotti writes, "Over time, organizing into movements increasingly became a strategy for artists eager to supplant older, more established ones. This strategy spread after the success of the Impressionists, once it had become clear that at least some contemporaries regarded movements as the place where significant contemporary art was being produced. As an organizational form, movements thus became appealing to young, ambitious artists" (2009: p. 286). In this way, circles of artists tied to each other in order to establish new artistic schools have become a regular feature of cultural production and play an important role in shaping artists' careers.

Markets and Industries

Hesmondhalgh argues that "Bourdieu misses the importance of the rise of cultural industries [in the 20th century] for understanding the changing social relations of cultural producers" (2006: p. 220). Specifically, the distinction between autonomous and heteronomous production is overly polarized and "restricted production has become introduced *into* the field of mass production" (2006: p. 222), especially as the cultural industries work to address demand uncertainty in order to try to control risk in production. This dovetails with White's arguments (2002) that markets are enduring networks linking producers with consumers in relatively stable patterns across time. These networks attempt to limit uncertainty by monitoring other actors similar to themselves in the market. "So commitment and uncertainty," White writes, "are the twin themes in production markets" (2002: p. 7). Market transactions are repetitive, relatively stable ties among actors in the network so that "the market [is a] joint social construction" (2002: p. 10) from which also arises the socially constructed judgment of 'quality' and of 'reputation' – both important features in the art market.

The institutional logics perspective takes into account "the duality of the material and symbolic aspects of institutions" (Thornton et al., 2012: p. 18) addressing both the structure and the culture of institutions. It allows us to ask *why* actors are engaged in particular network structures. For example, Thornton and Ocasio (1999) argue that the need for new sources of capital (among other pressures) among academic book publishers during the 1970s resulted in a shift of institutional logics from an editorial focus – "with editorial reputation and author-editor networks as key foci of attention in implementing the mission and strategy of the firm" (1999: p. 816) – to a market focus, dominated by "the logic of Wall Street investment bankers and the increasing concern with profitability and market orientation common to other U.S. industries" (1999: p. 816). This affects cultural products.

Sargut (2006) looks at the simultaneous effects of market structure and environmental (e.g., demand) uncertainty on the homogeneity of movie content between 1931 and 1950. Cultural innovation incurs risk for cultural production firms where demand uncertainty plays such an important role in decision making. Sargut found that when market concentration was low, increased environmental uncertainty lead to decreased product homogeneity as firms produced a diversity of products to try out on the public. Sargut argues that increased environmental uncertainty lead to increases in the number of network ties among cultural producers and firms taking cues about product content through their network ties. This in turn had implications for product homogeneity as the uncertainty in the environment is mediated by the linkages among the actors in the network.

Creative Places

Cultural production flourishes in some places and times more than in others. Network structures in those places may facilitate this. Large-scale structures exhibit many of the same network features that characterize individual creativity. While individual creativity is fostered by ties across structural holes which translate into access to diverse others, creative places tend to be those where diverse others are brought into contact with each other on a regular basis and where bridge ties linking small worlds are facilitated. An example of this would be Silicon Valley, where wide-ranging weak ties bridging the gaps between various companies and industries were fostered (Castilla et al., 2000). Other more explicitly cultural examples would be Renaissance Florence or Paris in the 1920s.

Physical environments create an environment for the flourishing of creativity when they facilitate tie formation, provide public spaces where informal meetings can occur, encompass a variety of uses and populations in small areas, provide ease of access at all times of day, and give people informal reasons to go there (such as the existence of cafes, etc.) The design of physical spaces can encourage the building of small world structures for the individuals, groups, and organizations that have access to that space.

In contrast, however, with individual creativity, which may be hampered by high-group density inhibiting deviant thought, the creativity of places is instead enhanced by high density, which allows individual cultural producers easier access to both to a critical mass of like-minded others (who may form artistic movement or collaborative circles) and simultaneously to divergent or even oppositional other groups. Access to these different groups reduces the chance of 'groupthink' and allows for the small world structures of links across structural holes to diverse ideas to form. Fresh information from outside that can generate innovative ideas is then available to the members of the groups.

Cultural production is deeply embedded in social networks at the individual, group, industry, and place level. These networks affect production of ideas as well as the production of cultural products and the ability of those products to reach an audience. These networks are not only sites of cooperation among cultural producers, but are also sites of conflict and competition which shapes the way in which culture is made and experienced.

Cultural Psychiatry

Ahmed Hankir, National Institute for Health Research Academic Clinical Fellow in Psychiatry, Manchester University, Manchester, UK

Abstract

Culture plays a crucial role in the crafting of a community's collective character. Moreover, the cultural community that a person is embedded in ineluctably has an influence on that individual's cognitive schema, behavior, occupational and social functioning, and modus operandi. Given the ubiquitous influence of culture on behavior of every sort, it follows that culture is an essential influence on deviant, dysfunctional, or otherwise problematic thoughts and behaviors as well, which carries the further implication that the healing professions, including psychiatry, need to be as attentive to culture as they are to clinical information.

Introduction

> We human beings are, after all, cultural beings…
> Professor Laurence Kirmayer, James McGill Professor and Director of the Division of Social and Transcultural Psychiatry at McGill University, Montreal, Canada

Culture has been defined as the "*Learned, shared and transmitted values, beliefs, norms and life ways of a particular group [of people] that guides their thinking, decision-making, and actions in patterned [stereotypical] ways.*" We know that culture is integrated; people acquire and assimilate culture. Although culture can change (gradually or abruptly), culture also ensures generational continuity. It is society and culture – through the proxy of policy-makers – that determine the provision of physical and mental health-care services (and the parity or *dis*parity of esteem between the two) and those who may receive and use them.

The roles that are played by psychiatry and society, in any given time and place, can influence the dialectic between the two, which can be complex, multifaceted, and constantly shifting due to cultural currents. Culture can mold the meaning of mental health symptoms (to an individual or a group) and can also influence the expression of these symptoms (the so-called 'idioms of distress'). Moreover, culture 'orchestrates' the interaction between the patient and the health-care system that they are situated in. Culture can influence the dynamic between a doctor and a patient, the establishment of a rapport between the two, and, consequently, the development of a therapeutic alliance.

Jung's Archetype, 'The Wounded Healer'

It is noteworthy that each and every individual is susceptible to developing some form of mental or physical illness. Indeed, one could argue that succumbing to illness in any of its many forms is what defines us as human beings. *We* thus have the capacity to 'transform' into treatment-seeking patients.

Carl Jung used the term the wounded healer as an archetypal dynamic to describe a phenomenon that may take place in the relationship between analyst and analysand (Burns and Burns, 2009). Jung discovered the wounded healer archetype in relation to himself; for Jung, "*…it is his own hurt that gives a measure of his power to heal…*" (Jung quoted in Anthony St, 1994). Despite the perception that doctors should be 'invincible' (Harvey et al., 2009), they, too, are human beings, and as such can develop psychopathology and become treatment-seeking patients. Doctors, however, have low levels of help-seeking for their own psychiatric problems, often only presenting to mental health services once a crisis arises. Fear of exposure to stigmatization is a critical factor contributing to secrecy and symptom concealment (Semple and Smith, 2008). The 2008 Stigma Shout survey of more than 4000 people using mental health services and carers revealed that health-care professionals are a common source of discrimination reported by those who have mental illness (http://www.time-to-change).

Just what are the consequences of a doctor with mental health challenges being immersed in a culture in which fellow health-care professionals hold stigmatizing views toward psychiatric illness? The consequences can in fact be quite catastrophic. Dr Daksha Emson, a brilliant psychiatrist with bipolar affective disorder, tragically killed her baby daughter and died following an extended suicide on 9 October 2000. An independent inquiry into Dr Emson's death concluded that she was the victim of stigma within the National Health Service (North East London Strateg, 2003). In other words: a culture of stigma is killing people.

In order to address the pernicious issue of stigma, a starting point would be for each and every health-care provider to be honest with himself or herself in order to develop an insight into their 'soul' and challenge the prejudice that may reside therein. Another way to change negative attitudes toward health-care professionals with psychopathology is to realize that those kinds of experiences may actually be beneficial as opposed to being disadvantageous. For example, a motif in the narratives of doctors who have firsthand experience of psychiatric illness is that they have become more empathetic toward their patients (http://www.rcpsych.ac.uk/). Indeed, in an interview with Laurence Kirmayer, he argues that "*…as a physician, coming to terms with one's own vulnerability and using it to help understand the predicaments of our patients can provide an*

important path to empathy and a way to mobilize their own capacities to heal…" (Hankir, 2014).

Cultural Stigma and Recruitment into Psychiatry

There are some cultures that are more stigmatizing than others toward psychiatry and psychiatric illnesses, and this can have an effect on recruitment into the specialty and the number of psychiatrists there are in a given place. For example, in an interview with a British consultant psychiatrist who rendered voluntary mental health humanitarian services to civilians in post-Arab-Spring Libya, he reported that there was not a single psychiatrist in the entire city of Misrata (Hankir and Sadiq, 2013). A contributory factor to this statistic is the perception, certainly in the Arab world but not confined to it, that psychiatrists are not 'real' doctors and that the specialty does not have a robust scientific basis or 'is not scientific enough.' Medical graduates may thus be reluctant to specialize in this area of medicine, since they may gravitate to what they perceive (and certainly what the media portrays) to be the more 'glamorous' and 'legitimate' specialties such as plastic surgery.

Culture can also determine the amount of resources that a government allocates to the provision of postgraduate psychiatric training and the funding that services receive. For example, culture can contribute to the disparity of esteem between physical and mental illness. From a health-care policy and provision point of view, this can result in the closure of psychiatric inpatient beds, which is what has been happening in the UK, resulting in some service users in a crisis having to travel hundreds of miles from where they live in order to receive emergency inpatient care.

Model of Culture and Individual

Hahn (Hahn, 1988) in his opus discusses and describes the sociocultural ontology of sickness and healing in which he also elaborates on the concepts of 'construction,' 'production,' and 'mediation' and argues that these concepts are interrelated. The formulation of the biopsychosocial model of disease has incorporated the aforementioned concepts. Hahn (Hahn, 1988) proposes that the patterned and stereotypical interactions between members of a group can influence an individual's behavior, which is subject to judgment by a collective entity known as society. These interactions can influence the definitions of health and suffering.

It is important to appreciate that the social definition of illness is the 'construction,' whereas sociocultural influences are the 'mediators.' According to Hahn (Hahn, 1988), 'production' is said to be engineered by socially organized interpersonal relationships and is the least recognized and understood concept out of the three mentioned. It is inevitable that the concepts of 'construction,' 'production,' and 'mediation' are strongly influenced by an individual's beliefs and the relationships that people have with other members of society, both of which may be pathological (i.e., the delusional beliefs of a person who has schizophrenia and the manipulative dependence on other people in patients who have emotionally unstable personality disorder).

'Medically Unexplained Symptoms' and Somatization

The psychosocial aspects of care are often recognized in dealing with common conditions like fibromyalgia syndrome in rheumatology or irritable bowel syndrome in gastroenterology. But understanding the personal and social context of illness is essential not only for categories of medically unexplained symptoms or functional syndromes that are a large part of practice in every medical specialty but for every health problem. We human beings are, after all, cultural beings. The way that we learn to see the world shapes every aspect of experience, including the ways we perceive and cope with illness and disease (Hankir, 2014).

Somatization is becoming increasingly recognized as a problem in patients in both general hospital and primary care settings. However, patients not only *somatize*, but they can also *psychologize*, as is illustrated in the following narrative from a foremost authority on cultural psychiatry (Hankir, 2014):

> …One [experience] that comes to mind was an experience of my own "attributional style." One day, I was on the floor playing with my infant daughter, and I vividly recall feeling so tired that I found it hard to get up from the floor. At the time, I interpreted this fatigue as a sign of depression – though my mood was fine. I saw my family doctor who diagnosed me with asthma (which I had never had before). So it seems I was engaged in psychologising, rather than somatising! Because I am a psychologically oriented practitioner, it was easy for me to devise a psychological explanation for my experience of fatigue. This really drove home the point that the ways we explain symptoms depend on personality, past experience and social context. It is important, however, to say that the division between psychological symptoms and physical symptoms can be quite arbitrary. Illness affects us as whole organisms – involving our bodies, thoughts and feelings. What we focus on – and what we feel we should conceal – is influenced by culture…
>
> Hankir, 2014

The Portrayal of Cultural Interpretations of Disease in 'Popular Culture'

There is a growing perception that science alone provides overall insufficient foundation for the holistic understanding of the interaction between health, illness, and disease (Hurwitz and Dakin, 2009). The health humanities has emerged as a distinct entity in an attempt to improve the provision of health services. The health humanities can broadly be described as the application of art and literature to medicine (Oyebode, 2009).

As mentioned above, culture can influence how an individual and a community perceive and react to physiological and psychological phenomena. Take, for example, the American physician and writer Khaled Hosseini's novel, *A Thousand Splendid Suns*, which focuses on the tumultuous lives of Mariam and Laila, two Afghan women. While Mariam is a teenager, she witnesses her mother having a seizure and believes the cause of this to be religious, i.e., her mother being possessed and persecuted by a malevolent entity (the Islamic belief of *jinn* possession) as opposed to 'medical,' i.e., a disturbance in the electrical activity of the brain such as epilepsy.

Although this is a fictional account, it does have relevance to clinical psychiatry. The explanatory models that a cultural group formulates can influence why they may, for instance, consult a faith healer as opposed to a general practitioner and hence not receive the benefits of early intervention. If, however, an immigrant from Pakistan does make it to, for example, an outpatient clinic in the Royal Bolton Hospital in England, attributing psychological phenomena, such as jinn possession, these patients should not be considered delusional, since the belief they have presented with would be consistent with the cultural norm of countries in that region of the world. This example illustrates both the importance of developing a cultural competence in psychiatry and also how literature and art can be used for educational purposes and undergraduate psychiatric teaching.

The study of the portrayal of mental illness in film also falls under the wide-ranging remit of the health humanities. Film wields a colossal power. Through the journey of a single film, we can take a roller-coaster ride across the spectrum of human emotion. Film can enthrall an entire auditorium heaving with people, or it can silence and even reduce them to tears. Films are extremely popular across the different cultures. India is the country that produces the largest number of films every year. In 2009 alone, the Hindi film industry Bollywood contributed to producing a staggering 1288 Indian feature films. America, Hong Kong, and Nigeria are examples of other countries where film industries are booming.

One could argue that as long as human beings continue to seek entertainment and escapism – for example, as the twentieth-century Noble laureate T.S. Elliot said, "*mankind cannot bear very much reality*" – cinema will remain deeply embedded in our society.

The story lines of films are influenced by the society we live in. Given that one in four of us has a mental illness at some point in our lives (World Health Organisation, 2001), mental illness and the psychiatrists who treat these illnesses play huge roles in our society and on our screens. Movies can provide an insight into what it is like to have a psychiatric illness, portray the role of a psychiatrist, and reveal how society reacts to either or both. In view of this, Professor Dhinesh Bhugra, President-elect of the World Psychiatric Association, actually examined Bollywood films produced since the early 1960s as a means to analyze the changes in Indian society's attitudes toward mental health issues (Deakin and Bhugra, 2012). Professor Bhugra's analyses reveal how in postcolonial India in the 1950s and 1960s, there were many films featuring people with mental illness who were subject to ridicule, but there were also some films that had sympathetic portrayals of sufferers of mental illness. In the 1970s and 1980s, when the country was going through major economic, social, and political crises, the portrayal of mental illness in film was very much of psychopaths who could not rely on the system to provide for the vulnerable, so they were vigilantes taking the law into their own hands. This image of mental illness sufferers transformed in the 1990s, when there were many motion pictures that portrayed morbid jealousy – typically films in which men were trying to control women, and women became a kind of object or property in the same way that economic liberalization allowed them to own objects, so women were seen as property.

Inaccurate portrayals of mental illness can perpetuate stigma and propagate myths, but when correctly presented, they can educate the public, inform employers, and empower service users. Film, therefore, can be used for educational purposes, and the Royal College of Psychiatrists (RCPysch) is not oblivious to this. Indeed, an example of an initiative that the College supports is a monthly blog on their Web site entitled '*Minds on Film*.' According to the Web site, *Minds on Film*, "*…explores psychiatric conditions and mental health issues as portrayed in a selection of readily available films…*"

The international medical film festival *Medfest* is another initiative that operates under the auspices of the Public Education Committee of the RCPsych. The festival in 2012 was entitled "HealthScreen: Understanding Illness through Film," and its aim was "*To stimulate debate of the social, political and ethical implications of portrayals of health and illness on our screens.*"

'Illness' versus 'Disease'

Eisenberg (Eisenberg, 1977) and Kleinman (Kleinman, 1980) argue that in psychiatry, as in the rest of medicine, a line of demarcation must be made between disease and illness. Disease, succinctly put, is about pathology. Illness, however, is something that a person develops when their disease starts to have effects on them and the people who encompass them. Disease literally means dis-ease – a malfunctioning of biological or psychological processes – whereas illness refers to the psychosocial aspects of disease. Illness thus includes the subjective perception of the disease, and its social and interpersonal dimensions and implications.

With respect to the assessment, diagnosis, and management of individuals presenting with physical or psychological symptoms, the culture can be such that doctors, including psychiatrists, are solely trained and interested in recognizing and addressing disease. Patients, however, are by and large interested in the effects that disease has on their functioning, i.e., the implications that illness might have on their social and occupational functioning (for example, the so-called 'illness' role and sick leave from work) and indeed existence in general. Thus, doctors are primarily preoccupied with formulating a differential diagnosis, and although patients are often concerned and interested in what the diagnosis may be, they are more concerned about what the mechanism of the disease is as well as how the disease might impact on their lives. There exists, therefore, a clash between the patient's views and explanatory models with those of his or her doctor. Consequently, the space and discord between the patient and the doctor can lead to tension and poor outcomes. A perceptive and culturally competent clinician must be able to detect this issue and act accordingly to ameliorate it, i.e., ensure that the provision of health-care services is service-user centered.

To make matters even more complex, there is the society-defined concept of sickness, which can determine what is deviant behavior and how much, for example, sick leave is permissible and socially acceptable for a particular illness. (If someone is receiving chemotherapy for breast cancer, society may, by and large, be empathetic toward this patient, whereas if a patient is admitted into a psychiatric unit for electroconvulsive therapy, society, particularly this patient's work colleagues

and employer, may not be as understanding and empathetic as they would be toward the breast cancer patient or even the same patient who may have had breast cancer in the past. In fact, the complete opposite might be true: they may shun and ridicule this person and even blame them and accuse them of having a 'weak' personality. This patient can then become ostracized, and social exclusion can cause them to become isolated, which can exacerbate the psychopathology they are experiencing. In extreme cases, this can even result in suicidal behavior).

A major step in recent years has been the effort to clarify how to collect and organize information about culture and context in mental health. Diagnostic and Statistical Manual (DSM)-5 (APA, 2013) (the recent revision of the diagnostic system of the American Psychiatric Association) introduces a cultural formulation interview. This is a basic approach to exploring the social and cultural context and meaning of illness. It should be part of the tool kit of every physician (Hankir, 2014).

The DSM-5 is an American diagnostic and classificatory system (APA, 2013), and its formulation is influenced by the cultural values in the United States. American culture, therefore, contributes to how disease is defined in DSM. As more and more countries are leaning toward commodification of health, with an ever-increasing remit for private sector providers and pharmaceutical companies, it is important that the sacred contract between medicine and society, as stipulated and enshrined in the Hippocratic oath, is adhered to so as to ensure that the provision of health care is evidence based and service-user centered, and that patients get the best treatments they need and deserve.

Gough's 'Social Contract'

Gough (Gough, 1936) defined and described a 'social contract,' which, in many ways, mimics discussions on cultural observations about what is normal and what system needs to be put in place in order to manage those who are described as 'abnormal.' Although, as Gough (Gough, 1936) had pointed out, in previous generations the original social contract was between the king and his royal subjects, this too was an implicit contract, i.e., obedience to the king was presumed providing the king conducted himself in a judicious fashion. The subjects would promise allegiance to the king, who in return offered them protection and good governance. Both the king and his royal subjects would honor their side of the agreement otherwise the contract would not be tenable. As society has evolved, so too has the application of Gough's social contract, i.e., the social contract between an employer and his or her employees and disciplinary procedures to deal with recalcitrant members of staff.

In the realm of the provision of mental health-care services, recent challenges have meant that psychiatric practice must adapt to the multitude of changes that are taking place in societies across the globe, i.e., migration (both internal and external, for example, the diaspora of Syrian refugees into Turkey consequent to the Arab Spring that spread to that region), seemingly perpetual changes in patient expectations, and advances in health-care systems. All of the aforementioned play a major role in the dynamic between patients and clinicians.

The Stress of Migration

The process of migration has been divided (in what we feel an arbitrary manner) into three stages as premigration, migration, and postmigration, although these may not be entirely distinct stages and a large degree of overlap may exist. Premigration is the period when an individual, having decided to migrate, starts to prepare himself or herself and others around him or her about the potential migration and familiarizes himself or herself with the practicalities needed for this purpose. The stage of migration itself is the actual physical process of relocating to the destination culture. Although the individual may physically be present in the country that they have migrated to, there may be a delay in mentally coming to terms with this. The postmigration phase is seen as the period of adjustment immediately after migration but may last for a protracted period, even years (Bhugra, 2003; Bhugra and Ayonrinde, 2004).

Birthplace is an index of migration, and as such can form part of the definition of a migrant ethnic population. Immigrants, particularly refugees, have long been treated as a marginalized, stigmatized, and socially excluded people from their destination culture. This and other issues that immigrants can encounter (i.e., acculturation stress, poverty, unemployment, and the inability to speak the dominant language to name but a few) can have profound effects on their mental well-being. There are a number of factors that are likely to influence postmigration adjustment and acculturation (Berry, 2007). Several theoretical constructs have been identified and are as follows: loss, fatalism (embedded in a sense of control), expectations of and from the destination culture, negative life events, and lack of social support, along with loss or clash of values and skill-set deficit (Furnham and Bochner, 1986; Ruiz et al., 2011). For those who migrate from rural to urban areas or across countries (or indeed continents), the process of acculturation becomes significant. Acculturation is a complex period of adjustment to the destination culture and may lead to an individual giving up some of the values they acquired from their origin culture. Acculturation itself is not straightforward and may be accompanied by stress.

Gender and other factors such as education, social class, housing, employment, and economic factors will also have an influence on the development of clinical depression. Chandra (Chandra, 2011) points out that the 'feminization of migration' is increasing with globalization and this can have a direct effect on female mental health.

Other vulnerable groups such as older adults, children and adolescents, homosexuals, and transgender individuals are at higher risk of developing depressive illness following migration. Other factors, especially perceived or real racism in the destination culture, may contribute to the genesis of depression by generating feelings of persecution and affecting aspiration and achievement.

Refugee Populations

Globalization has resulted in the mass movement of people as well as commodities and resources. People migrate for a number of reasons such as educational, professional, economic, and political, or any combination thereof. It is

important to differentiate between groups who have migrated voluntarily and those who have migrated through compulsion (i.e., were forced to migrate due to genocide in their country of origin).

Refugees are perhaps the most vulnerable group of all immigrants. According to the Geneva Convention (1951), a refugee is a person who has a "*well-founded fear of being persecuted for reasons of race, religion, nationality, membership of a particular social group or a particular political opinion, is outside the country of their nationality and cannot, or will not, because of fear, benefit from the protection of that country*." Conflict in the refugee's country of origin may result in the development of severe psychopathology such as post-traumatic stress disorder and major depressive disorder. Severe psychiatric illnesses in refugees may be a prelude to suicidal ideation. This and the way in which they are received by the destination country, dilapidated living conditions, and lack of social support and isolation all contribute and conspire to rendering this immigrant group particularly vulnerable to suicidal behavior (Bhugra et al., 2011).

Some migrant populations (including refugees) are wealthy, while others are in abject poverty. We should therefore realize that the phenomenon of migration is complex, and we should not come to any conclusions about the way in which migration influences social experience and health. Succinctly put, migrants are not a homogeneous group, and we should refrain from making generalizations about them and certainly do our utmost to prevent the perpetuation of negative stereotypes.

The act of migration itself can affect individuals in a diversity of ways. A person might migrate independently or with a group of people. Migration experiences and 'trajectories' can vary considerably. For professionals, such as doctors, the migration process may lead to changes in their status and income with specific issues related to settling down in the destination culture. For example, an immigrant may be a brilliant surgeon but may not be proficient in the language of the destination culture, so despite his ability to, for example, dexterously excise a benign tumor with surgical precision, he does not have the communication skills to 'operate' at the coalface of clinical medicine when trying to explain the procedure and its consequences and possible complications to a patient. Doctors who migrate to the UK have to take exams to prove that they are proficient in the English language and are familiar with colloquial parlance. It is not unheard of that a person who was a competent physician in India ends up working in a restaurant in Edinburgh as a chef because of his inability to speak fluent English. Such a change in status can precipitate psychopathology.

Cultural Psychiatry

Cultural psychiatry has developed as an entity in its own right over the last seven decades, with the term transcultural psychiatry being introduced in the psychiatric lexicon by Eric Wittkower in Montreal (dubbed 'the birthplace of cultural psychiatry') in the 1950s (Hankir, 2014). Byron and Mary-Jo Good from the University of California Davis were also central in a renewed engagement between medical anthropology and psychiatry initiated by the work of psychiatrist/anthropologist Arthur Kleinman.

Cultural psychiatry has focused on health disparities – both globally and locally – in terms of the needs of immigrants, refugees, and ethnocultural minorities. At the same time, it has continued to advocate for an integrative approach to care that challenges mainstream psychiatry. In recent decades, there has been a striking biologization of psychiatry, especially in the US, with the assumption that neuroscience is going to give us the core understanding of the etiology and treatment of illness and disease. To a large extent that has become the dominant view and the perspectives of social science and psychology have been downplayed (Hankir, 2014).

It has been argued, however, that human biology is cultural biology. The brain is the organ of culture, and we use our brains to acquire and adapt through cultural inventions like reading, mathematics, and other complex social practices. Many of the problems that are seen in psychiatry may reflect not structural abnormalities in the brain but the consequences of learning (programming the brain), and the unhealthy environments and social relationships that people must negotiate (Hankir, 2014).

Cultural Identity

All of us have a cultural identity, which is directly related to the cultural framework we carry within us. Cultural identity operates at both individual and group levels. Depending upon a number of factors, an individual may have a tendency to relinquish some aspects of their cultural identity and cling on to others. Individuals can actually have multiple cultural identities. For example, a person may be born in Northern Ireland, be brought up in England, attend university in Lebanon, form a romantic relationship with someone he or she has met in Canada, and work in Australia. Each country's culture will have an effect on the individual and result in the synthesis of multiple cultural identities within a single person.

Cultural Bereavement

As discussed and described above, an immigrant often has to come to terms with loss, and this is often heralded by bereavement. Psychoanalytic explanations of the loss of all that is important for an individual may lead to melancholia and depression and has been termed cultural bereavement (Eisenbruch, 1990, 1991). Stress of migration may also produce physical illnesses, and clinicians must be aware of the interaction between physical and mental illness. For example, a person with depressive illness who also has diabetes may lack the energy and motivation to comply with their medication. This patient may consequently develop life-threatening diabetic ketoacidosis (DKA). When a clinician encounters this scenario, it is paramount not to just provide 'symptomatic control,' i.e., to solely treat the DKA, but rather they must have the insight to address the underlying cause, i.e., to manage the depressive illness.

'Culture Conflict' and 'Culture Shock'

The term 'culture conflict' describes tensions between individuals or even the struggle that an individual has with oneself when they attempt to resolve and integrate perceived or real irreconcilable values (Bhugra and Becker, 2005).

An individual may have with oneself a conflict concerning one's own 'soul.' Take, for example, a single Muslim Saudi Arabian man who has migrated to a Western destination culture where prostitution and alcohol are legal. That very man must, if he cares to abide by the tenets of Islam, attempt to resist these temptations, which are seemingly ubiquitous. Despite the fact that he may be a pious and devout individual, he is, after all, a human being, and as such it is only natural for him to have a desire to succumb to the temptation. He may not be able to resist this powerful impulse and by capitulating to it be engulfed by remorse and pathos for (in his perception) betraying his faith. A possible consequence of this is the development of suicidal ideation and behavior in the context of a severe depressive illness as has been evidenced in clinical case studies (Hankir and Zaman, 2013).

Regarding tensions between individuals, we can use the example of when a younger member of a migrant family is attracted to the destination culture he or she is thrust into. This young immigrant may individuate and deviate from the culture of origin and imitate the prevailing culture. The family may then attempt to reel the perceived maverick youth back into the fold and inculcate him or her with traditional cultural values. Here we have a clash between the ostensibly dichotomous orthodox values of the origin culture and the less traditional values of the destination culture. This can result in the renegade individual feeling melancholic, isolated, ostracized, and, in extreme cases, suicidal. This would be consistent with the findings of research into intergenerational conflict in young people of Asian origin in the United States, which showed that intergenerational conflict increased the risk of suicide by 30-fold, especially in less educated young people (Bursztein and Makinen, 2010).

Culture conflict should be distinguished from 'culture shock,' which is what individuals may experience after migration, as their adjustment to the destination culture may occur over a prolonged and protracted period. There is, however, a degree of overlap between the two. Culture shock has been defined as the "*Sudden unpleasant feelings that violate an individual's expectations of the new culture [they have migrated to] and cause them to value their own culture negatively*" (Bhugra and Ayonrinde, 2004). Oberg identified six aspects of culture shock: strain; a sense of loss or feelings of deprivation; rejection by members of the new culture; role expectation and role confusion; surprise, anxiety, and indignation; and feelings of impotence (Oberg, 1960).

Prevention and Management Strategies for the Development of Psychopathology in Immigrants

Sometimes the clinician has a stereotyped approach, has not had interpreters available, or is unaware of crucial cultural factors when they encounter an immigrant who may be suffering from the symptoms of psychopathology. In order to tackle these issues, many models are available. These include culture brokers and cultural mediators as well as cultural liaison workers. The underlying principle, by and large, is that they will function as interlocutors and communicate between the services and the community the services are catering for.

The lack of translation services is a factor that severely impacts immigrant patients and prevents the completion of a thorough assessment and the offering of therapy. The provision of translation services may enable mental health service providers to detect the early warning signs of suicidal behavior in immigrant patients and consequently facilitate timely intervention to prevent completed suicides from occurring.

There have been further developments addressing the language barrier issue with many organizations developing leaflets in different languages. Indeed, there is evidence that supports the efficacy of leaflets in educating immigrant, cultural, and religious groups about mental illness and distress (Bhugra, 2004).

A Personalized Approach to Managing Mental Illness in Immigrants

> To the world you may be just one person but to one person you may be the world.
>
> Bill Wilson

Dignity is in the heart of everything that we do in the provision of mental health-care services. It can be all too easy to be prescriptive when assessing and treating a service user and the person can be lost in the protocol. By all means we condone and commend adherence to treatment algorithms and guidelines formulated by a robust evidence base in the management of psychopathology in immigrants; however, there can never be a replacement for personalized treatments (and perhaps in no other specialty is this more possible than in psychiatry).

We encourage mental health-care service providers to take a holistic and personalized approach in the assessment and treatment of immigrants who present with psychopathology, to deploy the 'soft skills' of listening and empathy to allow the narratives to unfold and flow, and, consequently, a rapport and therapeutic alliance to become established. "*The voice of the human heart needs no translation*" said Queen Rania of Jordan. Sometimes, just being made to feel that someone is genuinely listening to you with all earnestness and compassion and that someone actually cares can be the antidote that a lonely and forlorn human needs to nourish their soul with. In this scenario, nonverbal (and nonjudgmental) communication and tranquil silence can be more efficacious than any drug and offer a safe sanctuary where deep and seemingly indelible wounds can heal.

Conclusions

Culture is dynamic and affects all aspects of illness and behavior. The 'idioms of distress' that immigrants use may not necessarily match diagnostic criteria, and although culture is being homogenized by globalization, there are no universal

models of psychotherapy or pharmacotherapy for the treatment of mental illness. To summarize succinctly: One size does *not* fit all.

The lack of culturally competent health-care practitioners and culturally sensitive and personalized mental health services can present as major barriers for immigrants to accessing and engaging with the relevant services.

Assessing the mental health needs of immigrants includes openness to exploring cultural formulations to elicit the meaning of symptoms. A presenting complaint has to be explored to understand the suffering behind the symptom. Indeed, Oliver Sacks argues that "*…in order to restore the human subject at the centre, the suffering, afflicted, fighting human subject, we have to deepen a case history into a narrative or tale.*"

As in other areas of medicine, education is key, and training in cultural competency should be part of the curriculum for all mental health professionals, including teachers, nurses, and medical students in attempts to fathom the idioms of distress of immigrant groups, to detect psychopathology that may be a prelude to suicidal behavior, and to offer timely intervention to prevent attempted or completed suicide from taking place.

Lastly, we must be advocates and agents of cultural change in the broader society if we want things to get better for our patients.

Cultural Psychology

Richard A Shweder, University of Chicago, Chicago, IL, USA

© 2015 Elsevier Ltd. All rights reserved.

Abstract

There is a substantial portion of the psychological nature of human beings that is neither homogeneous nor fixed across time and space. At the heart of the discipline of cultural psychology is the tenet of psychological pluralism, which states that the study of normal psychology is the study of multiple psychologies and not just the study of a single or uniform fundamental psychology for all peoples of the world. Research findings in cultural psychology focus on differences in mentalities by virtue of membership in ancestral groups and raise questions about the value and social function of alternative forms of human subjectivity.

Cultural Psychology: What Is It?

A major aim of the discipline called cultural psychology is to document variations in modes of (and ideals for) normal psychological functioning in different ethnic communities. One assumption of the discipline – the premise of nonuniformity – is that there is a substantial portion of the psychological nature of human beings that is neither homogeneous nor fixed across time and space. Cultural psychology seeks to document the protean cultural aspects of human psychological nature, especially the ways fundamental features of the mental life of all human beings (the various capacities definitive of a subjective life – the abilities to think, know, want, feel, and value things as good or bad) assume different shapes in different cultural traditions. The discipline can be defined as the study of the distinctive mentalities of particular peoples (Balinese Hindus, Satmar Hasidim, Chinese Mandarins, secular coastal elites in the United States) (see Garreau, 1982; Geertz, 1973; Greenfield and Cocking, 1994; Heine, 2011; Kitayama and Cohen, 2010; Levy, 1973; Markus et al., 1996; Menon, 2013; Miller, 1997; Nisbett, 2004; Shweder, 1991; Shweder and LeVine, 1984; Shweder et al., 1998; Stigler et al., 1990).

Cultural psychology can thus be distinguished from the study of general psychology, which is the study of mental structures and processes that are so widely distributed as to characterize the normal psychological functioning of all human beings (or perhaps even nonhuman primates as well). Research in cultural psychology has, for example, systematically corroborated the special status accorded to the defense of female honor in the mentality of many Southern American White males (Nisbett and Cohen, 1995). Research in cultural psychology has authenticated the claim that there is a positive sense of empowerment and a feeling of virtue associated with modesty and the attitude of respectful restraint in the psychology of women in some regions of the contemporary non-Western world (Menon and Shweder, 1998). Such feelings of power and goodness associated with modesty contrast with ideas about (and ideals for) psychological functioning constructed in the contemporary Anglo-American cultural region. Research in cultural psychology has documented factional intragroup and cross-cultural differences in the normative ethical concepts (such as liberty, equality, respect for status, loyalty, and purity) that give shape and meaning to human moral judgments and a personal sense of conscience (Haidt, 2013; Jensen, 2010; Shweder et al., 2003). Research findings in cultural psychology thus raise provocative questions about the integrity and value of alternative forms of subjectivity across cultural groups and within and between countries and regions of the world.

A second assumption of cultural psychology is that many mental states (and some mental processes) are best understood as by-products of the never-ending attempts of particular groups of people to understand themselves and to make manifest their self-understandings through social practices (Bruner, 1990; Geertz, 1973; Wierzbicka, 1993, 1999, 2013). That might be called the premise of self-reflexive social construction. Whether one studies Inuit Eskimos or Anglo-American middle-class conservatives or liberals, the aim in cultural psychology is to spell out the implicit meanings (the goals, values, and pictures of the world) that give shape to psychological processes (Briggs, 1970; White and Kirkpatrick, 1985). The aim is to examine the patchy or uneven distribution of those meanings on a global scale and to investigate the manner of their social acquisition, for example, by means of participation in the symbolic practices, including linguistic practices, of this or that tradition-sensitive cultural group (Haidt, 2013; Menon, 2013; Wierzbicka, 2013).

The Mental States of Others

One of the several aims of cultural psychology is to develop a language for the comparative study of mental states that makes it possible to understand and appreciate the mental life of others. 'Others' refers to members of some different cultural community who by virtue of life long membership in that group ascribe meaning to their lives in the light of wants, feelings, values, and beliefs that are not necessarily the same as one's own.

Cultural psychologists are interested, for example, in cultural variations in the degree to which feelings are constructed as 'emotions.' Anna Wierzbicka (1999) has suggested that while all normal human beings have feelings (e.g., pleasure and pain, arousal and serenity) many of the emotions lexicalized in the English language are not universally available in the mental life of people around the world. There has been

 http://dx.doi.org/10.1016/B978-0-08-097086-8.24053-1

much research in cultural psychology into the character of the particular emotions (Ifaluk 'fago,' American 'happiness') that are salient or important in different types of social worlds (Lutz, 1988; Kitayama and Markus, 1994; Shweder et al., 2010).

Cultural psychologists are interested as well in population-based variations in social cognition, moral judgment, and the sources of personal fulfillment or life-satisfaction in different social groups. For example, they have studied the origin, significance, and place of filial piety and the social motivation to achieve in some East Asian populations (Yang, 1997; also see Kitayama et al., 1997). They have investigated the self-empowering aspects of ascetic denial and other forms of sacrifice among high-caste women in South Asia (Menon, 2000, 2013). They are concerned to document the divergent meanings and distinctive somatic and affective vicissitudes of such experiences as loss (or success or of not getting the things you want, etc.) for members of different cultural communities. It is in the pursuit of such research questions that they have discovered replicable cultural differences in reports about the quality of the experience of loss (and gain). In comparison to majority populations in Northern Europe or the United States, majority populations in Samoa and China are more likely to react to apparent loss with feelings such as headaches, backaches, and other types of physical pain than with feelings such as sadness or dysphoria (Levy, 1973; Kleinman, 1986). Cultural psychologists also seek to document differences in modes of thought (e.g., analytic vs holistic) (Hong et al., 2000; Nisbett, 2004; Nisbett et al., 2001), in self-organization (e.g., interdependent vs independent) (Markus and Kitayama, 1991), and in moral judgment (e.g., reliance on an ethics of autonomy vs an ethics of community vs an ethics of divinity) across different types of groups (Haidt, 2013; Jensen, 2010; Shweder et al., 2003).

In most of its research the field of cultural psychology has been pluralistic in its conception of normal psychological functioning and interdisciplinary in its conception of how to go about studying the origin, meaning, and social role of particular mental states on a worldwide scale. The field draws together anthropologists, psychologists, linguists, biologists, and philosophers in its study of the diverse, yet potentially effective, modes of psychological functioning that have been produced, and socially endorsed, in different cultural traditions, and have made those cultural traditions possible. Indeed, cultural psychology is sometimes described as the study of the way culture and psyche make each other up.

The Tenet of Psychic Pluralism

The premise of nonuniformity when taken together with the premise of self-reflexive social construction sum up to the master principle of the discipline of cultural psychology. This is the tenet of psychic pluralism, which states that the study of normal psychology is the study of multiple psychologies (mentalities, subjectivities), and not just the study of a single or uniform fundamental psychology for all peoples of the world. Cultural psychology is thus the study of the way the human mind (understood to consist of an inherently complex, heterogeneous collection of abstract and/or latent schemata) can be transformed, and made functional, in a number of different ways, which are not equally distributed across time or space. Hence the slogan, "one mind, many mentalities: universalism without the uniformity," which is meant to give expression to goals of a discipline aimed at developing a credible theory of psychological pluralism. A much discussed essay on the 'weirdness' (in the sense of 'atypical' or statistically deviant) of experimental findings in mainstream Western psychology (research typically conducted on subject populations from Western Educated Industrial Rich Democratic (WEIRD) societies) highlights the hazards of rushing to claims about the so-called basic or fundamental or universal psychological processes (Henirich et al., 2010).

Cultural psychology can also be understood as a project designed to critically assess the limitations and incompleteness of all uniformitarian versions of the idea of psychic unity. Alternatively put, cultural psychology is the study of ethnic and cultural sources of diversity in emotional and somatic functioning, self-organization, moral evaluation, social cognition, and human development. It is the study of population differences in the things people know, think, want, feel, and value, and are customarily motivated to do, by virtue of life course membership in some recognizable group that has a history and a conception of its own destiny. "To be a member of a group," the eighteenth-century German romantic philosopher Johann Herder argued "is to think and act in a certain way in the light of particular goals, values and pictures of the world; and to think and act so is to belong to a group" (as represented by Berlin, 1976). Although the field of cultural psychology has many ancestral spirits (Giambattista Vico, Wilhelm Wundt, Wilhelm Dilthey, Edward Sapir, Ruth Benedict, Clifford Geertz) and some very prominent contemporary advocates (Jerome Bruner, Michael Cole, Jacqueline Goodnow, Patricia Greenfield, Shinobu Kitayama, Richard Nisbett, Hazel Markus, Anna Wierzbicka) Johann Herder is justly claimed as one of the original cultural psychologists, although he was probably not the first. For an account of the historical development of the field see Jahoda (1991) and Cole (1996).

Culture and the Custom Complex

One of the contributions of cultural psychology is to revive a conception of culture that is both symbolic and behavioral. In the history of twentieth-century anthropological thought the idea of culture has been variously defined, either behaviorally (as patterns of behavior that are learned and passed on from generation to generation) or symbolically (as the categories, beliefs, and doctrines that organize habitual or customary behavior and can be used to rationalize and justify a way of life). In research on the cultural psychology of a particular cultural community the notion of culture usually refers to community-specific ideas about what is true, good, beautiful, and efficient that are made manifest in behavior. To qualify as cultural those ideas about truth, goodness, beauty, and efficiency must be socially inherited and customary; and they must actually be constitutive of different ways of life, and

play a part in the self-understanding (including the self-criticism) of members of the community.

Alternatively stated, the concept of culture as used in cultural psychology refers to what Isaiah Berlin called goals, values, and pictures of the world that are made manifest in the speech, laws, and routine practices of some self-monitoring group. These are sometimes also called cultural models (D'Andrade, 1995; Shore, 1996). Cultural psychologists thus engage in the interpretive, symbolic, or cognitive analysis of behavior. They assume that actions speak louder than words and that customs and habits are a central unit for cultural analysis. Thus, what John Whiting and Irvin Child (1953) once referred to as the custom complex is a natural unit of analysis or starting point for a study in cultural psychology.

Whiting and Child introduced the idea of a custom complex in 1953 but the basic idea was not really taken up and carried forward until the rebirth of cultural psychology in the 1980s and 1990s. According to Whiting and Child a custom complex "consists of a customary practice [for example, a family meal, arranged marriage, animal sacrifice, a gender identity ceremony involving circumcision] and of beliefs, values, sanctions, rules, motives and satisfactions associated with it." There are many labels that social theorists in different scholarly disciplines have placed on this type of unit of analysis, for example, a custom complex, a life space, a habitus. Whatever the label, this is the type of unit of analysis that makes it possible to conceptualize cultural psychology as the study of the way culture (ideas about what is true, good, beautiful, and efficient made manifest in practice) and psyche (what people know, think, feel, want, value, and hence choose to do) afford each others realization, and thus make each other up.

A Provocative Example of a Custom Complex: Genital Surgeries in Africa

A rather dramatic but highly illuminating example of a custom complex is the circumcision ceremony or genital surgery that is customary for both boys and girls in many East and West African ethnic groups. In the countries of Sierra Leone, Mali, the Gambia, Ethiopia, Somalia, the Northern Sudan, and Egypt genital surgeries are culturally endorsed and popular for both males and females, and receive high approval ratings from the vast majority of men and women in the general population. Human rights advocacy groups in Europe and in the United States have criticized the practice, labeling it 'female genital mutilation.' The expression 'female genital cutting' is also widely used by the mainstream media in Europe and North America; although those are not the ways the custom is labeled by those for whom it is a customary and personally meaningful practice. A recent review of the medical and demographic literature on African genital surgeries by a panel of experts and published in *The Hastings Center Report*, the bioethics journal, suggests that the widely publicized claims about the severe and negative consequences of the custom for health, sexuality, and childbirth have been hyperbolic and rather one-sided and deserve to be viewed with a skeptical eye (Public Policy Advisory Network on Female Genital Surgeries in Africa, 2012; also Obermeyer, 1999). In a detailed description of the cultural psychology of male and female circumcision among the Kono people of Sierra Leone, Fuambai Ahmadu, who is both an insider and an anthropologist, has written as follows (Ahmadu, 2000: 301). "It is difficult for me – considering the number of these ceremonies I have observed, including my own – to accept that what appear to be expressions of joy and ecstatic celebrations of womanhood in actuality disguise hidden experiences of coercion and subjugation. Indeed, I offer that most Kono women who uphold these rituals do so because they want to – they relish the supernatural powers of their ritual leaders over against men in society, and they embrace the legitimacy of female authority and, particularly, the authority of their mothers and grandmothers."

Among the various goals, values, and pictures of the world (the cultural psychology) that make this practice meaningful and satisfying for those men and women for whom it is a custom complex are the following:

1. A culturally shared belief that the body (especially the genitals) of both males and females are sexually ambiguous until modified through surgical intervention. According to this picture of the world the foreskin of a boy is viewed as a feminine element and masculinity is enhanced by its removal. Similarly the slightly protruding visible part of the clitoris is viewed as an unwelcome vestige of the male organ, and Kono females, as described by Ahmadu, seek to feminize and hence empower themselves by getting rid of what they perceive as a dispensable trace of unwanted male-like anatomy.
2. A culturally shared aesthetic standard in terms of which the genitals of both women and men are viewed as ugly, misshapen, and unappealing if left in their natural state. For many African men and women the ideal of beauty is associated with a sexual anatomy that is smooth and cleansed (shaved) and free of all fleshy encumbrances. This aesthetic look has gained some popularity on a global scale and is well represented in the 'vaginal rejuvenation' operations offered to a middle-class clientele by cosmetic surgeons in Europe and North America.

There is of course much more to be said about the beliefs, values, sanctions, rules, motives, and satisfactions associated with female (and male) genital surgeries in Africa. Nevertheless in the light of these and other culturally endorsed reasons a genital surgery is experienced as an improvement of the body in many East and West African ethnic groups (Ahmadu, 2000; also see Shweder, 2013).

The cultural psychology of the customary practices of any particular community is likely to result in a depiction of other minds that is unsettling, astonishing, or at least surprising for those whose goals, values, and pictures of the world are characteristic of the cultural psychology of some other group. Radical divergences in visceral attachments and in the moral evaluation of particular custom complexes (such as male and female genital surgeries) are themselves important topics for research in cultural psychology. Indeed, the cultural psychology of moral evaluation is currently an active research area (Fassin, 2012). Moral concepts (e.g., human rights, justice as equality) privileged in some sections of society and in some regions of the world are not necessarily the moral concepts that are most salient and important in other sectors of society and regions of the world (Haidt, 2013; Jensen, 2010; Shweder et al., 2003).

Cultural Psychology: What It Is Not

The tenet of psychic pluralism and the emphasis on goals, values, and pictures of the world as a source of psychological differences between cultural communities distinguishes cultural psychology from other fields of study (such as cross-cultural psychology and national character studies) with which it should not be confused.

It Is Not Cross-cultural Psychology

Research in cultural psychology proceeds on the assumption that psychological diversity is inherent in the human condition, and that culture and psyche are interdependent and make each other up. It should be noted in passing that any theory of psychological pluralism would lack credibility if it staunchly denied the existence of any and all universals. Indeed, as should be obvious, cultural psychology presupposes many psychological universals (e.g., feelings; wants; goals; ideas of good and bad, of cause and effect, of part-whole relationships, etc.) (see Shweder et al., 1998). However, the search for and the privileging of things that are uniform across all peoples is a project that goes under other names, for example, general psychology or perhaps even cross-cultural psychology.

Some of the goals of cross-cultural psychology (which is here contrasted with cultural psychology) have been described by Segall et al. (1998). One goal is "to generate more nearly universal psychology, one that has pan-human validity" and to attain "a universally applicable psychological theory." A second closely related goal it to "keep peeling away at the onion skin of culture so as to reveal the psychic unity of mankind at its core." It is for that reason that cross-cultural psychology (not to be confused with cultural psychology) can be viewed as a vigilant cousin of general psychology; for they both share the same uniformitarian goals. Such goals give a distinctive character to cross-cultural psychology. And they help explain why all of the following kinds of activities are typical of research by cross-cultural psychologists and distinguish it from research by cultural psychologists.

Thus one of the aims of cross-cultural psychology is to determine the boundary conditions for generalizations generated in the Western labs with Western (mostly college student) subjects, generalizations which, prior to critical examination by cross-cultural psychologists, have been presumptively interpreted as fundamental or natural and universalized to the whole world (see the results of the review of research in cross-cultural psychology by Henirich et al. (2010)). The aim here for the cross-cultural psychologist is not to represent the distinctive cultural psychology of particular peoples. This aim does not result in research focused on differences in the way members of different communities perceive, categorize, feel, want, choose, evaluate, and communicate that can be traced to differences in salient community-based goals, values, and pictures of the world. Rather the aim for the cross-cultural psychologist is to make sure that the hope for universal psychology is truly universal and to throw out any claim that only holds in the Anglo-American world. This is an extremely useful corrective for the tendency of Western psychologists to over generalize their findings, but it is not the same as undertaking a project in cultural psychology.

A second aim of cross-cultural psychology is to establish comparability or equivalence for measuring instruments across different populations. Often the goal here is to try to show that people in different cultures really are alike, and that any reported differences in performance were due to noise, or inappropriate measuring instruments, or bad translations, or misunderstandings about the way to ask and answer questions. The instincts of a cultural psychologist run in quite a different direction. For a cultural psychologist (not to be confused with a cross-cultural psychologist) the 'noise' is interpreted as a signal about true differences in cultural meanings (goals, values, and pictures of the world), and not as something to eliminate or overcome. Indeed, cultural psychologists are likely to worry if one's measuring instruments travel easily and well from university classroom to university classroom around the world and display the same psychometric properties here and there. They may suspect that one has not really landed in a truly different culture at all. This is because "Peeling away the onion skin of culture so as to reveal the psychic unity of mankind at it core" is not what cultural psychology is about.

A third major aim of cross-cultural psychology is to focus on the so-called independent variables of the cultural environment (for example, nucleation of the family, literacy vs nonliteracy) that are thought to either promote or retard psychological development. In such research development is almost always defined in terms of universal norms for promoting progress in cognitive, emotional, or social functioning (e.g., Piaget's notion of 'formal operational' thinking or Ainsworth's notion of healthy 'attachment'). Cultural psychology is primarily concerned with the elaboration and discovery of alternative or plural norms for successful psychological development, which is another way it can be distinguished from cross-cultural psychology (LeVine, 1990).

It Is Not National Character Studies

Attempts to characterize whole populations in terms of generalized dispositions (e.g., authoritarianism, Apollonianism, high need for achievement) went out of fashion in psychological anthropology in the late 1950s and early 1960s. This happened for several reasons but largely because looking for variations in types of personality traits to explain differences in cultural practices or custom complexes (and vice versa) turned out to be something of a dead end. It was discovered that if one tries to describe individuals within and across cultural communities in terms of general dispositions or traits of character, then within group variations typically exceed between group variations. It was discovered that hypothesized 'modal personality' types typically characterize only about one-third of the population in any particular cultural group.

A major insight, although a fragile one, of recent work in cultural psychology is that is better to represent and interpret human behavior the way sensible economists do rather than the way global personality trait theorists do. That is to say, it is better to think about behavior as emanating from agency or the exercise of will by individuals, and to analyze it as the joint

product of 'preferences' (including goals, values, and ends of various sorts) and 'constraints' (including beliefs, information, skills, material and social resources, and means of various sorts). This avoids the hazards of dispositional approaches in which behavior is interpreted as the by-product of mechanical forces pushing both from inside (in the form of personality traits) and outside (in the form of situational pressures). Ultimately, a fully successful piece of research in cultural psychology must avoid nominal dispositional categories such as holistic versus analytic and render behavior intelligible in terms of the particular goals, values, and pictures of the world that motivate and inform the domain-specific behaviors and routine practices of specific intentional agents. To do otherwise is to reify cultural stereotypes and fall into some of the traps of the past.

The Future: Going Indigenous

The field of cultural psychology that has reemerged on the North American and European scene during the past 30 years is quite similar to an intellectual movement that has grown up in the non-Western world and is increasingly known as indigenous psychology. Indeed the Society for Humanistic Psychology of the American Psychological Association has even created an Indigenous Psychology Task Force (http://www.apadivisions.org/division-32/leadership/task-forces/indigenous/index.aspx). One of the most eminent theoreticians of this movement, Kuo-shu Yang, the Taiwanese social psychologist who was originally trained in the United States, lists several ways to 'indigenize' psychological research. Here are four of Professor Yang's virtues for the aspiring indigenous psychologist of China (Yang, 1997):

1. Give priority to the study of culturally unique psychological and behavioral phenomena or characteristics of the Chinese people.
2. Investigate both the specific content and the involved process of the phenomenon.
3. Make it a rule to begin any research with a thorough immersion into the natural, concrete details of the phenomenon to be studied.
4. Let research be based upon the Chinese intellectual tradition rather than the Western intellectual tradition.

Those are some of the virtues that define cultural psychology as well, although it remains to be seen how many of us can live up to such demanding standards. Even today with the rebirth and renewal of cultural psychology not all research actually begins with fieldwork or with "a thorough immersion into the natural concrete details of the phenomenon to be studied." All too often research still starts with a published finding from some Western lab, which is then subjected to critical examination by means of various attempts at replication with populations from other societies. Whether the habits and norms for conducting research in mainstream psychology will change remains to be seen. The recent attention to the 'weirdness' of research findings with restricted subject populations in WEIRD societies has certainly sparked some debate about how to reform the norms for research training in the United States (Henirich et al., 2010). Although fieldwork, local language learning, and the sampling of diverse populations are not yet a standard feature of training in the discipline of psychology, given the increasingly international and interdisciplinary character of collaborative scholarship in cultural psychology one looks forward to more and more research that keeps faith with Kuo-shu Yang's high ideals.

Cultural Relativism, Anthropology of

James W Fernandez, University of Chicago, Chicago, IL, USA

Abstract

This article discusses views toward cultural relativism in the history of anthropology, from Franz Boas to the present. It shows the grounding of versions of relativism in the anthropological field experience of cultural diversity, and identifies the tensions between anthropology and more foundationalist philosophies. Yet it notes the openings toward more perspectival views in philosophy as well, and distinguishes between kinds of relativism in anthropological thought and practice. Debates argued over foundationalism and relativism too often draw on stereotyped depictions of the alternatives.

Relativism is a doctrine that, recognizing the importance of the perspectival in experience, offers a skeptical resistance to the philosophical and intellectual interest in universalisms and absolutes. This resistance in the Western tradition dates back to the Sophists, and running through Hume, Kant, Marx, and Nietzsche extends to the modern pragmatists who conceive of knowledge as relative to contexts of power and social solidarity. Anthropological or cultural relativism derives from the awareness produced by ethnographic fieldwork of the multitude of different lifeways and cultural perspectives in the world. It has also given evidence of local awareness of the impact of the perspectival in human affairs. This is found in the folklore of different peoples. In America, there has been a particularly strong strain of cultural relativism deriving from the work of the founder of American anthropology, Franz Boas, and his students. This American school emphasized the shaping force of culture on behavior and understanding. Strong forms of this relativism are found in the work of Benedict and Herskovits. Milder forms are found in the skepticism of Sapir and Geertz about the determined scientific pursuit of universals. In any clarifying discussion, anthropological relativism has to be differentiated into epistemological, descriptive, or methodological, and normative or moral forms. Few anthropological relativists would subscribe to all these forms and are usually partial to one or several only. Cultural relativism, despite the many attacks upon it, continues to inspire interest and commitment to one or another or all of its forms. Since the early 1990s anthropological interest in universal human rights has been a considerable challenge to relativistic thinking within the discipline.

Relativism, which may be taken in most general terms as the awareness of the presence and importance of the perspectival in judgment and understanding, is generally understood as a philosophical problem and a hobgoblin of the pretensions to generalization and universalization of thought characteristic of the intellectual classes. But much if not all that has been taken up and intellectualized by these classes was first found among the folk as part of their lore anchored in the particularities of experience. Anthropologists and folklorists can readily confirm this observation, for in practically any book of proverbs will be found axiomatic observations on particular experiences which are relativistic in import. People are usually aware from their domestic everyday experience of the difference of perspective and the relativity in understanding between men and women, the old and the young, the parent and the child, and the slow and the quick. We might observe that it is philosophers and theologians who have lived among absolutes and have worked to impose them, while in 'the practice of everyday life' the common people characteristically live among relatives. Lately, philosophers have been increasingly taking cognizance of that awareness and its implicit perspectivalism if not relativism.

In philosophy, to be sure, there has been a long tradition of relativistic thought. The Sophists' cultivation of the contestatory rhetoric of community life and community organization is often taken as relativistic in implication and action, and Hume's (1975) skepticism about general observations including any universal moral principles is surely relativistic in spirit. Kant's view of the constructed nature of the metaphysical and Hegel's historicism are instrumental in the development of the more radical relativisms found in Marx and Nietzsche. Modern-day French philosophers continue this perspectivalism whether in the 'archaeology of knowledge' and the 'conditions of understanding' explored by Michel Foucault (1979) or in Jacques Derrida's 'deconstruction' of arguments ordinarily taken as unquestionably foundational (1993). American pragmatism especially has anchored its 'antifoundationalism' in an awareness of the perspectival from William James' *A Pluralistic Universe* (1909) to Richard Rorty's emphasis on the community and cultural context of all understanding (1989, 1999). These scholars focus, respectively, on knowledge as conditioned by power, rhetorical or textual construction, and social solidarity. Such views have steadily and perhaps definitively been undermining overarching claims to metaphysical universals. It has certainly given rise, in respect to moral philosophy, to attempts to relate relativism to reason, that is, to practice a 'reason within relativism.'

Anthropology, a discipline mainly emergent since the mid-nineteenth century, has not been immune to these philosophical developments and the crisis of representation and legitimation they usher in. Indeed, it has become, through its various arguments for cultural and linguistic autochthony, a central player in the relativism/universalism wars. The interest of anthropologists, particularly in the issue of cultural relativism, derives first from ethnographic field experience of the variable proverbial wisdom of local life lived on the ground, as it were, or from the fact that anthropologists usually work comparatively across cultures and, therefore, across

 http://dx.doi.org/10.1016/B978-0-08-097086-8.12047-1

cultural and language perspectives, or from the long interest in anthropology in the difficult problem of universal human rights. Philosophy, understandably, has reacted by exercising pointed critique of the *incoherence* of anthropological relativism – it is inescapably self-refuting and it undermines its own truth claims – and the *perniciousness* of anthropological relativism – it undermines philosophical commitment to the improvement of thought and the discovery of 'truth.'

The anthropology of Franz Boas is generally seen as the fountain head of cultural relativism in American anthropology. Although originally a physicist, Boas was increasingly cautious both about universalization of things human and the hierarchization of human groups which often accompanied such practice. His chief intellectual opponent was classic evolutionism, with its invidious ranking of societies on a scale from savagery to civilization. His chief popular opponent was racism, or in its benign form, the Civilizing Mission. Indeed one of Boas' few popular books, in an otherwise vast oeuvre – *The Mind of Primitive Man* (Boas, 1938) – attacked 'racial determinism,' that is, the association between biology and 'personality' (by which he meant behavior in the broadest sense). He did this by focusing on the shaping force of culture upon behavior and understanding (that is, upon 'mind'). In this book itself, therefore, preceded by any number of lectures and papers dating from the late nineteenth century, Boas laid the early ground work for the 'cultural relativism' of his students, although this was not a term he employed to any extent.

There are several other classic stimuli to relativistic views in the Boas oeuvre. In 'The study of geography' (Boas, 1887), while resisting geographical determinism, he stimulated thinking on methodological relativism by pointing to two different and justifiable approaches to field data, the nomothetic or law seeking and the idiographic or descriptive, each of which differently attuned to local circumstance gave different yet necessary understandings of the field data. It may be said, particularly in the postmodern times, that although increasingly convinced by the 'structuring power of tradition,' Boas in his emerging relativism never abandoned entirely the universalist hope of the scientific mission, and method and the seeking, however cautiously, of lawful generalizations.

Cultural relativism in its strong form is identified with two of Boas' foremost students, Ruth Benedict and Melville J. Herskovits. In her widely read *Patterns of Culture*, Benedict (1934) took particular aim at universalist notions of the normal and abnormal. This argument was made effective through its arresting portraits of three cultures, Pueblo, Dobu, and Northwest Coast Indians, whose characteristic behaviors, abnormal from a Western perspective, are portrayed as normal from the local perspective.

Benedict repeatedly resisted ethnocentric and provincial views of the normal and argued a 'great arc of human possibility' (Benedict, 1934, p. 34) of which no culture could take full advantage and on which every culture had to make its particular choices. It was Melville Herskovits, however, who most directly framed the issue of 'cultural relativism' in his general text *Man and His Works* (Herskovits, 1948), and whose collected arguments could be posthumously published as *Cultural Relativism* (Herskovits, 1972).

None of the Boasians, including Herskovits, were out and out relativists in the epistemological sense that they gave up on the possibilities of discovering universals beyond the fact of cultural relativity. In all their writings there appears the promise of those eventual discoveries. They are all to be considered, rather, methodological and moral relativists whose main aim was to resist ignorance of and moral superiority toward other cultures, and exploitative intolerance of them. The aim was to increase mutual respect and tolerance in the world. Herskovits argued, however, that such cultural relativism was not derived from any kind of moral philosophy, but rather from the empirical anthropological observations on diversity by field-working anthropologists. Nevertheless, he struggled with many dilemmas of philosophical type in his 'cultural relativism': negotiating the universal and the particular, the practical and the ethical, the 'is' and the 'ought,' anthropological science and anthropological humanism, the cross-cultural and the within-cultural view, and the applied and the philosophical. His strategy was to convert these dilemmas, which arise from the fate of the field-working man or woman of science finding himself or herself inescapably situated in the fold of philosophy, into the revelatory paradoxes of anthropological practice (Fernandez, 1990).

The heyday of 'cultural relativism' in the United States – in the sense of seeking to define a durable doctrine in the face of persistent assault from various moral philosophies on the one hand and philosophies of science on the other – were the decades of the mid-twentieth century, the 1930s through the 1960s. Subsequently, however, some notable contributions to this enduring issue have come forth together with a contemporary challenge to relativistic thought: the human rights movement. Marshall Sahlins (1976), although not espousing 'cultural relativism' in its paradoxical sense of moral obligation to defend diverse local moral orders, nevertheless conducted a compelling argument against the culture-free universalization, mainly among economists and political economists, which accepts utility interests as the dominant principle in practical reasoning. In the 1980s, a notable argument developed over relativism and the role of culture in determining reality principally among three anthropologists: Renato Rosaldo, Clifford Geertz, and Melville Spiro.

Rosaldo (1989) addresses the impact on older notions of the stable truths and dispassionate objectivities of classic social analysis made by awareness of both the anthropologist and his or her informants as 'positioned (and repositioned) subjects' recurrently engaged in an ongoing dramatic process of 'relational understanding.' In such a process truth becomes a very moving target only perspectivally to be apprehended, if at all, and in any case best interpreted by narrative analysis firmly set within and not beyond cultural contexts. While not espousing a straight-line cultural relativism, he notes and resists the return of a 'nostalgia' for the authoritative, often imperious, truths of objective social science – a nostalgia most often self-justifying by using a stereotyped notion of relativism.

This strategy of skepticism has also been that of Geertz, the central player in the interpretive approach that puts the play of perspectives at the center of anthropological inquiry. In 1984 he offered an intricate argument, exemplified in the double

negative of the title of the article, 'Anti–anti relativism' (Geertz, 1984). He takes to task the resurgence of absolutist interests in affirming some metaphysical or, what is the same, very physical, that is to say biological, realities behind the influence of cultural and language differences. This search for 'nature's own vocabulary,' and the security of objective biological truths on this side of culture, truncates what anthropology is all about, and Geertz questions the kind of 'hearty common sense' that simply ignores the diversity of lifeways plentifully evidenced in the anthropological archive. While written in defense of that broadly rather than narrowly humanizing knowledge of diversity laboriously acquired by anthropology, Geertz neither directly espouses in any direct way the moral commitments present in an earlier 'cultural relativism' nor denies the probability that on the other side of culture there may be some universals to discover.

In defense of the possibility of scientific, which is to say universal, measurability and explanation across cultural boundaries, Spiro (1986) develops a useful contrast between three types of cultural relativism: descriptive (that there are important empirical differences between cultures), normative (that evaluative judgment of the norms expressed in these differences are always relative to cultural contexts and hence not generalizable), and epistemological (that culture determines what we know and how we know it). Spiro accepts descriptive relativism and the perspectivalism it reflects, and the cautions of field methods it enjoins. He rejects the strong form of normative relativism, which argues against any possibility of cross-cultural judgment of human practices, as well as epistemological relativism in general, which would argue both for ontological incommensurability between cultures and for the irrelevance or perversity of the discovery of biological and psychological commonalities in humankind. It has been the tendency, he argues, in the fin-de-siècle age of textual hermeneutics, to espouse an immoderate form of epistemological relativism; something that the earlier cultural relativists, although committed to descriptive and moderate normative relativism, never did. The consequence is simply to deny the possibilities of an explanatory science of humans anchored in a valid and verifiable logic of discovery, with all the implications for professional authority that such a denial of principled comparative inquiry entails.

In the 1990s, an important area of challenge to cultural relativism arose in the argument for universal human rights. At first glance, cultural relativism would seem to be an impediment to such universalization of a value. Indeed, oppressive states proclaiming state sovereignty over their citizens often claim justification in 'cultural relativism.' This defense begs the question for all concerned of cultural boundaries within states, which is to say the question of the definition of culture and its boundaries in a pluralizing, globalizing world. That the relation between cultural relativism and universal human rights need not be taken as inevitably oppositional is seen in recent efforts on the part of the Human Rights Commission of the American Anthropological Association, to posit a species-wide disposition to create culture and cultural difference, and the corresponding right to such creation and such difference as long as it does not impose on that right in others (American Anthropological Association, 1998; Turner, 1997).

More recently Carrithers (2005) has made a convincing argument that there is a moral universal implicit in anthropology's dedication, through its field working requirement of participation and observation, to obtaining the fullest possible understanding of the other's cultural perspective. The success of such dedication, he argues, is only possible if the anthropologist and his or her interlocutors are persuaded in their interaction by the universal principles of mutual trust, forebearance, and acceptance of the other's worth. These principles, in turn, rest upon the knowledge, nurtured by the pluralism of understandings so evident in the great multitude of human lifeways studied by anthropologists, that the human condition 'could always be otherwise.'

There may remain problems with these enlightenment arguments, as theory and practice, but they move the debate away, as for example does Geertz' argument before them, from a simple and fruitless opposition in which one or another pole of the debate is confined to a stereotyped reading. Also they preserve the practical and methodological consequences of cultural relativism as an open, generous, and locally attuned posture of critical cultural inquiry into the 'other.'

In reviewing this century-long argument over relativism in the social sciences, we may note several principal points. First, there is the tendency for stereotypic views of the opposite argument to emerge, with the consequence that the opponent's views are trivialized and simplified. Second, strong and moderate forms of cultural relativism in its various aspects (descriptive, normative, and epistemological) must be distinguished if the argument is to obtain to any clarifying power. Third, the methodological aspect of cultural relativism and its importance, in its descriptive and normative aspect, as a posture of inquiry must be recognized for those, mostly but not exclusively anthropologists, who have chosen to work in other cultures. Fourth, the discussion of cultural relativism is inevitably related to one's definition of culture and particularly cultural boundedness. Fifth, it must be recognized that the logics of inquiry differ significantly between the sciences and the humanities. Hence the discussion of relativism is itself relative to what disciplinary faculty is anchoring and being evoked in the discussion. Sixth, there is a politics of relativism which is inevitably present – the Boasian relativists, for example, were pronouncedly egalitarian, pluralist, and antiauthoritarian in their values. Relativism has been a recurrent irritation, a valuable provocation, and a useful restraint on imperious inquiry in the academy, and has produced over this long period some of the most interesting arguments about just how individual scholars and researchers with different agendas working in different cultures with differing worldviews are to come together and engage in a productive and fair-minded inquiry. Without the gadfly of relativism, the horsemen of social science, galloping through their research agendas and in pursuit of theoretical confirmation, might well be more headstrong and less empathetic beings.

Cultural Resource Management: Conservation of Cultural Heritage

Thomas J Green, Arkansas Archeological Survey, Fayetteville, AR, USA

© 2015 Elsevier Ltd. All rights reserved.

Abstract

Cultural resource management is the practice of conserving and preserving cultural resources. In a broad sense, cultural resources include archeological and historic properties, museums, archeological parks, shipwrecks, cultural landscapes, sites of religious and cultural significance, traditional ways of life and languages, and associated artifacts and documents. Modern society values cultural resources for their associative, a esthetic, informational, and economic significance. Such resources are nonrenewable and threatened by economic development, population expansion, and natural forces. Conflicts develop between preservation advocates and development agencies, national governments and local communities, and indigenous peoples and professionals over how such resources should be utilized and preserved. International, national, and local communities have legal and bureaucratic systems to deal with these issues.

Introduction

Cultural resource management (CRM) is the practice of conserving and preserving cultural heritage. Tangible cultural resources include archeological, historical, architectural, and engineering properties, and associated artifacts and documents. Other tangible cultural resources include museums, libraries and archives, archeological parks, shipwrecks, cultural landscapes, religious sites, and locations where plants and animals are gathered by traditional peoples. Intangible cultural resources include traditional lifeways, religious practices, and languages (King, 2009). These resources represent the cultural heritage of individual peoples and nations, and, collectively, they represent the heritage of the world. Cultural resources reflect finite periods of time or ephemeral cultural traditions. Once destroyed, they are gone forever. Economic development, agricultural practices, looting, international trafficking in stolen artifacts, and natural erosion destroy thousands of cultural resources every year. For this reason, the primary management goal is preservation *in situ*. The term *cultural resource management* is used mostly in the United States by archeologists working for federal and state agencies or for private firms contracting with such agencies (Fowler, 1982; Green and Doershuk, 1998). *Heritage management* or *cultural heritage management* are similar terms used in many parts of the world and can be used interchangeably with CRM.

Value of Cultural Resources

People value cultural resources for present and future uses (Lipe, 1984; Torre, 2002). They are tangible links to the past allowing people to experience and relate directly to their history, and they hold an evocative power sometimes lacking in documentary sources. Heritage properties have symbolic values for nations and ethnic groups because they represent a common history and identity, as well as cultural and spiritual norms. The process of deciding which cultural resources to preserve and monumentalize is therefore frequently contentious and politicized (Smith, 1994; Tunbridge and Ashworth, 1996).

The a esthetic value of cultural resources, especially architectural properties, provides incentive for the reuse of historic buildings long after original uses are no longer economically viable. The preservation of the historic core of nineteenth-century business districts in the United States is a priority because of the perceived a esthetic value of early buildings. The a esthetic appeal of architectural ruins around the world is a primary reason for their continued preservation.

Cultural resources have informational value. Archeological sites provide the only record of human achievement for much of history. At best, written documents cover events of only the past 5000 years and only in a few parts of the world. In parts of North America written records represent a scant 200 years. Government and business records, newspapers, diaries, etc., are fragile and subject to loss due to natural events, deterioration, neglect, and intentional destruction. Also, official records provide information primarily about dominant cultures and leaders. For these reasons the physical evidence in historic and archeological sites may be the only record of many past human activities, even in relatively recent times, and their destruction results in an immeasurable loss of information.

Cultural resources have economic value resulting primarily from their associative and a esthetic values. People want to visit heritage sites. Tourism is one of the largest industries in the world, and heritage tourism is one of the largest sectors of the industry. For many countries, such as the United Kingdom and Jordan, tourism is a major part of the economy. In the United States, cultural resources support a billion-dollar industry in the state of New Mexico alone.

Legal Protection

Cultural resources are the tangible links to the cultural heritage of the world. For this reason, UNESCO and the International Council on Monuments and Sites (ICOMOS), a private organization advising UNESCO, have produced charters establishing standards for preservation (US/ICOMOS, 1999). Two foundational documents guiding heritage management at the international level are the 1964 Venice Charter adopted by ICOMOS, and the 1970 Convention Concerning the

Protection of World Cultural and Natural Heritage adopted by UNESCO. UNESCO manages the World Heritage List, which recognizes cultural and natural sites of world significance, and the World Heritage Fund, providing financial assistance for various preservation projects.

Despite international interest in preserving heritage resources, most CRM is conducted under the laws of individual nations or local divisions within nations (McManamon et al., 2008; Messenger and Smith, 2010; Green, 2011). Laws have been established to protect cultural resources threatened by economic development projects, urban sprawl, vandals, looters, and neglect. In addition, nations must make a multitude of complex decisions regarding these issues. Governments must determine the ownership of individual artifacts and collections; oversee excavation permits and arrange for the use and care of resulting artifacts and records; mediate controversial issues such as the excavation of graves and human remains; allocate responsibility for funding archeological excavations or restoration projects in advance of construction projects; and determine the extent of involvement of various interested parties, such as indigenous peoples, in the processes of decision making. Most countries of the world have laws and regulations dealing with these issues, but some issues are more important in one country than another. Legal traditions and history invariably affect the law. For example, in Mexico the state asserts ownership of all prehistoric artifacts. US law reflects strong traditions of private property, and landowners retain ownership of artifacts found on their land.

Management Requirements

Knowledge is crucial in managing cultural resources (Green, 2008). Agencies need to know where the resources are, which are significant, why they are significant, and to whom. Plans for their preservation must be developed. If sites are threatened by dams, roads, water systems, or buildings, planning statutes usually require agencies or various units of government to address the impact of such projects. Nongovernmental corporations or organizations are frequently required to assess the effects of their projects on cultural resources or pay to have this work done. Accurate information is also crucial to protecting sites from looting and vandalism. Cultural resource inventories and evaluation studies should be conducted by appropriately trained specialists, such as archeologists, architectural historians, historians, and anthropologists. Thus, an inventory of significant cultural resources is the primary basis for management decisions.

Many countries have developed criteria to determine which cultural resources are significant, and these criteria vary from country to country. In the United States, properties as young as 50 years old are evaluated, while in Jordan only properties older than AD 1750 need be considered. The range in kind and type of significant properties also varies from place to place. Some countries consider only archeological and historic properties, while others include sacred and traditional cultural sites, and even contemporary expressions of culture such as festivals and dances. Consultation with local communities is essential to understand the values associated with particular cultural resources. Government agencies usually make decisions concerning significance, but even if a country does not have a formal evaluation procedure, someone must decide which resources are ultimately important and worthy of mitigation or preservation.

Once an inventory is obtained, it is necessary to determine which resources are threatened and need immediate consideration. It is a sad fact, but not all sites determined to be culturally significant can be preserved. Developing priorities for action is usually a process of give and take between those with preservation interests and others primarily working toward economic development. When properties cannot be preserved, appropriate mitigation measures must be developed. The type of mitigation adopted depends on the type of cultural resource affected and the values the property holds. Archeological sites are usually excavated, or sometimes buried, for protection. Architectural and engineering properties are documented through photography, photogrammetry, measured drawings, and the salvage of individual architectural features. When feasible, architectural properties can be moved to new locations. It is difficult to develop satisfactory mitigation measures for the religious or sacred properties important to traditional communities. Hard decisions have to be made about whether such controversial projects will be completed as planned or moved to another location.

Cultural resources in national parks and other protected areas may not be threatened by economic development projects, but they still need active management to prevent deterioration. The site of Petra in Jordan is a good example. Petra is famous for massive sandstone architecture and for water-control systems built by the Nabataean Arabs before Roman occupation. These famous architectural elements are continually eroded by wind-driven sand and rain and will disappear if not conserved. Jordanian conservation scientists are actively developing methods to preserve the site. Around the world, even in protected areas, limited financial resources dictate preservation priorities.

Another important element in the management of cultural resources involves the care of archeological and museum collections, archives, and documents. Great expense is involved in providing state-of-the-art, climate-controlled, and safe environments for storage, processing, and use of such collections. The conservation of paper, metal, and other perishable artifacts is a science in itself. Heated debates arise around the world about the appropriate distribution of artifacts. Many countries, such as Guatemala and Turkey, have increasingly strict laws about the transport and use of artifacts, and many European countries with colonial traditions and large archeological collections from the Middle East and elsewhere are facing various questions of repatriation (Herscher, 1998). The establishment and funding of curation facilities are part of this debate, as well as being crucial to the availability of knowledge and resources to future generations.

Traditions and points of view concerning the treatment of human remains and associated funerary objects differ widely among the cultures of the world. Such belief systems must be considered in the formation of CRM policies, as well as in national and international law. In some countries, indigenous peoples have insisted on the repatriation of human remains and associated funerary objects and other objects of cultural

patrimony (Smith, 2004). A satisfactory balance between the interests of the broader society in cultural resources and the needs of individual communities has not yet been reached, and these are among the most controversial issues facing heritage managers today. Conflicts are exacerbated in countries with recent histories of social injustice, and otherwise routine decisions are fraught with emotion. Animosities can be allayed as governments take responsibility for the legal protection of various rights and as people are forced to deal amicably and respectfully with each other's goals and beliefs. Consultation between government bodies and local communities is essential for successful preservation.

Tourism and Cultural Resource Management

The management of archeological parks, museums, and historic districts for tourism is a significant part of CRM. Tourism offers many opportunities for the preservation and restoration of heritage properties around the world, and because of the economic benefits of tourism, many individual communities and national governments are developing properties for tourists. The correct manner of development (Boniface, 1995), the authenticity and quality of interpretative presentation (Jerome, 2008), and the type and use of restoration methods are hotly debated issues. The tourist infrastructure, as well as interpretive facilities like trails and museums, can negatively impact the very cultural resources and landscapes tourists want to visit. In addition, conflicts can be expected when the interests of local communities are not considered.

Public Support and Education

The preservation of cultural resources is dependent on the support of the general public. The UNESCO and ICOMOS charters stress that the success of local and national preservation initiatives is dependent on programs educating the public about the value of cultural resources. Heritage education in the public schools is required in many countries to foster a preservation ethic and pride in national heritage. Governmental organizations and professional societies often cooperate in publicity campaigns to combat looting. In those parts of the world where sites of general interest represent a cultural heritage different from that of the contemporary inhabitants, education about the values and economic uses of these resources is especially important. For example, Roman and Byzantine ruins in modern Islamic countries and Native American sites in the United States are often valued more by foreign visitors than local communities.

The varieties of cultural resources in the world and the multiplicity of values attached to them make cultural resource management a complex practice. The preservation of cultural resources in the face of economic development, population growth, looting, and world conflicts requires integrated legal tools and protection policies at all levels of government, as well as trained professionals to implement them.

Cultural Rights and Culture Defense: Cultural Concerns

Alison Dundes Renteln, University of Southern California, Los Angeles, CA, USA

© 2015 Elsevier Ltd. All rights reserved.

Abstract

This article examines debates in political theory, international law, and the social sciences generally regarding the nature and scope of cultural rights. Cultural rights – the most understudied of all human rights – remain controversial, for reasons explored in this article. After identifying several key conceptual questions, the focus shifts to the protection of these rights in legal process and the types of difficulties that may arise when courts must wrestle with the analysis of sometimes unfamiliar claims. When individuals and groups attempt to follow cultural traditions accepted in their countries of origin but that are apparently prohibited in their new homelands, they may raise cultural defenses to explain the motivations for their actions. Defendants invoke the defense in a wide variety of contexts and in many countries. To afford insight into the nature of these disputes, a few of the more famous cases are described here. Although general principles of law and the explicit protection of culture in international human rights treaties appear to require the consideration of culture in legal proceedings, the extent of this protection remains unclear. Ultimately, the question is how much weight cultural rights deserve if their protection risks violating the rights of others, such as women and children.

The scope and nature of cultural rights remains an important topic in the twenty-first century. After interpreting the concept of culture as traditional culture, this article provides an overview of the manner in which individuals and groups invoke 'the right to culture' in order to protect their way of life from governmental intrusion. When members of ethnic minorities and indigenous groups are punished for following their traditions, they sometimes raise cultural defenses during their trials (Renteln, 2004, 2010a,b). This article discusses debates over cultural rights in the scholarly literature, primarily in political theory and international law (Francioni and Scheinin, 2008; Stamatapolou, 2007; Niec, 1999; Levy, 1997; Prott, 1988; Szabo, 1974; Goulet, 1981). One major issue is often who is the proper spokesperson for the group when controversies arise. Examples of litigation are presented from Australia, Canada, France, and the United States. Cultural rights are justified not only by explicit provisions in domestic law and international conventions, but also because their protection is required by general principles such as identity, freedom, and tolerance (Poulter, 1986, 1987, 1998).

Although cultural rights are sometimes regarded as the least developed category of human rights, they are unquestionably a key part of international human rights law (Symonides, 2000; Meyer-Bisch, 1993). Cultural rights have been highly controversial because their protection sometimes requires that other human rights be limited (Shachar, 2001). There is substantial debate about the proper interpretation of cultural rights, about which individuals are entitled to invoke them, and about what obligations governments have to enforce these rights (Stavenhagen, 1995; McGoldrick, 1991; Addis, 1991; Poulter, 1987).

Cultural rights are significant because culture is an intrinsic part of individual and group identities (Kymlicka, 1995). Not only does culture exert a crucial influence on the formation of the identity of individuals, but it also helps perpetuate ethnic groups. It is important to appreciate the status of cultural rights in law and politics (Nafziger et al., 2010).

The Term 'Culture'

In order to interpret cultural rights, it is first necessary to define the term culture. There are many different notions of culture including 'high culture' that refers to museums, operas, and the like; 'popular' or 'mass' culture that means comic books, films, and pulp fiction; and 'traditional' culture that can be construed as a way of life. While some commentators who analyze cultural rights have in mind 'high culture,' most of the discussion focuses on so-called 'traditional culture.' Of the multitude of definitions of culture, a particularly useful one was devised by the Canadian Commission for UNESCO, the UN agency responsible for the protection of culture:

> Culture is a dynamic value system of learned elements, with assumptions, conventions, beliefs and rules permitting members of a group to relate to each other and to the world, to communicate and to develop their creative potential (1977).

culture differs from society inasmuch as culture is an abstraction, whereas society is the collection of individuals in the community.

When culture is analyzed in the context of cultural rights, it is usually used as a synonym for a way of life. Culture encompasses many aspects of life including attire, child-rearing practices, diet, marriage customs, politics, religion, death rituals, and so on. In short, culture is constituted of the many and diverse folkways of ethnic groups. One attempt to delineate the many facets of culture is found in the Human Relations Area Files compiled at Yale University. Although some contend that projects which aim at documenting actual cultural practices risk 'freezing' them in a particular moment in time, cultural theorists invariably acknowledge that cultures are dynamic systems. While subcultures exist and have differing traditions, cultural communities nevertheless often share common characteristics such as language. Although contemporary theories generally emphasize the

fluidity and hybridity of culture, the reality is that many cultural forms persist for centuries (Brumann, 1999).

Cultural Rights

A major question has been whether cultural rights should be conceptualized as individual rights or group rights. Theorists, many of whom come from individual rights traditions, associate group rights with utilitarianism and worry that recognizing group rights may lead to the denial of individual rights. In reality, however, rights that have historically been considered bona fide individual rights such as religious freedom require the existence of a group. While this matter has generated much debate, there is no reason why the right to culture cannot be conceived of both as an individual and as a group right. Insofar as cultural rights include rights to language and religion, it would be difficult to deny the essential group nature of such rights (Das, 1994). Moreover, even if the right to culture were an individual right, it could still come into conflict with other individual rights.

Ordinarily, individuals and peoples exist in cultures without having to think self-consciously about the protection of their traditions, most of which are not controversial. It is only when their way of life is threatened by a dominant political system that ethnic minorities are compelled to assert a 'right to' culture. In this sense cultural rights represent a legal means by which minorities can shield themselves from intervention by the dominant political apparatus, which is normally the state. Governmental intrusion is a manifestation of cultural hegemony, or the imposition of the dominant culture by elites on ethnic minority groups.

Intervention by governments is not an infrequent occurrence as there is a widespread presumption that cultural minorities should become assimilated. When the folkways of a minority group clash with the standards of the dominant system, the expectation is that the members of the minority group should discard their customs. This is sometimes expressed in the form of a proverb: "When in Rome, do as the Romans do," based on the monocultural paradigm. However, shedding their folkways may not be a simple matter as individuals are often strongly motivated to follow their cultural traditions. Sometimes, they may face a dilemma as failure to comply with the folk law can lead to divine retribution or social ostracism. These individuals either violate the state law and face the consequences in the official legal system or else comply with state law and face dire consequences within their customary law systems.

The Cultural Defense

If individuals do, in fact, have cultural rights, this implies that there is a correlative duty on the part of governments to allow their cultural practices. This obligation is not an absolute one, however, and cultural rights will be allowed unless a more important, countervailing reason requires that they not be protected. The challenge, naturally, is to distinguish which are valid reasons for overriding traditions and which are not.

Most of the time governments decide that cultural traditions are not permissible because they threaten public health, safety, or morals. If individuals refuse to discontinue the practices, asserting that they have a right to follow their traditions, they may face criminal prosecution. In these circumstances, ethnic minority defendants may invoke what has been called the 'cultural defense.' Such a defense, while not formally recognized by any legal system, sometimes operates to acquit or to mitigate punishment. The core idea behind the defense is that individuals who act under cultural imperatives should be considered less culpable under the law than those who act in the absence of such an imperative. In order for judges to evaluate the extent to which a defendant's cultural background affected his or her behavior, they must consider cultural evidence relating to the offense. The chief difficulty in many cases is the tendency of courts to exclude cultural evidence as irrelevant. If courts do treat the information as admissible, establishing credentials of experts may be difficult because the nature of the anthropological evidence may not conform precisely to requirements of some rules of evidence.

Supporters of the cultural defense favor its adoption in order to ensure the consideration of evidence and to demonstrate genuine commitment to cultural pluralism. The cultural defense would also guarantee more equal treatment for cultural minorities in a legal system whose standards are based on the values of the dominant culture. Advocates contend that the cultural defense would result in condign punishment for ethnic minorities.

Opponents worry that if culturally motivated offenses go unpunished, this will undermine the deterrent function of the law. They often contend that anarchy will reign supreme if each individual can decide with which particular laws he or she will comply. The defense is criticized for giving special rights to minorities. This puts the victims of culturally motivated crimes at a disadvantage, and is therefore unjust.

The presentation of cultural evidence does not commit the court to accepting the argument. The evidence might not establish the existence of the tradition, that the ethnic group had this tradition, or that the defendant was influenced by the tradition when violating the law. The defense merely ensures that the information is treated as admissible in court. To the extent that cultural rights are guaranteed as part of human rights, the argument is that individuals should be entitled, at the very least, to present evidence about their cultural background in a court of law.

Much of the commentary about the cultural defense emphasizes the tendency of courts to accept oversimplified claims as though they truly represented the communities in question. What analysts fail to point out, however, is that the poor administration of the defense should lead to greater care with its use and not to discarding it altogether.

In the twenty-first century, individuals in Europe and North America raised cultural defenses in drug cases. Rastafarians argued they needed to use ganja (marijuana) in religious ceremonies while individuals from Kenya, Somalia, and Yemen were prosecuted for chewing khat (leaves that have a stimulant effect), a substance widely used in their countries of origin. Although accepted in social life elsewhere, khat was criminalized in Europe and North

America, despite the lack of documented harm, with the United Kingdom banning it in 2014 (The Misuse of Drugs Act (1971) (Amendment) Order, 2014). In Europe there has been litigation concerning whether Article 9, the religious freedom provision of the European Convention permits an exemption from drug laws (Gibson, 2010). Some decisions involved the consumption of hoasca tea as in *Gonzalez v. O Centro Espirita Beneficente Uniao do Vegetal* (2006), the US Supreme Court decision in which the conservative court carved out an exemption for religious minorities.

Another question is whether governments should allow exemptions from noise laws for loud religious sounds (Renteln, 2014c). In some cities the Islamic call to prayer sparks conflict partly because the new sounds are unfamiliar, unwanted, and therefore treated as 'noise.' When the dominant group comes to accept the sound, whether church bells or the call to prayer, the noise ceases to be interpreted as a nuisance and fades into the soundscape.

Minorities also assert their right to erect buildings based on their traditional use of space. For example, numerous controversies surround mosques with one of the most famous being the conflict in Switzerland over the minarets. Differing worldviews clash in local arena over requests for permits which planning authorities may decline to approve.

In many countries we also find cultural concern about which surgeries are consistent with human rights (Renteln, 2014; Sabatello, 2009). For instance, in Europe and North America there have been attempts to stop female genital cutting, also known as 'female genital mutilation' (FGM) by prosecuting those who cut young girls in their new homelands or who take them abroad to have the surgery performed elsewhere. Because family members are reluctant to testify against relatives, prosecutors have had difficulty winning convictions.

In 2014 the UK Home Secretary prosecuted a doctor for performing an episiotomy on a woman after childbirth. Because the statutes appeared to ban any genital cutting, they seem to apply, even though the FGM had occurred in the country of origin decades earlier. This would also mean that doctors seeking to help women by performing reconstructive surgery would be prevented form doing so by badly drafted legislation. Consequently, women encountered difficulty when they sought re-virgination (reconstructive) surgeries because they feared honor-related violence on their wedding nights. This resulted in the adoption of policies by professional medical associations advising surgeons not to perform hymenoplasties in these circumstances; to do so would violate women's rights.

When immigrant parents use corporal punishment to discipline children who misbehave, they also may wind up in court raising a cultural defense (Renteln, 2010). Although many different types of physical discipline are used worldwide, the committee that enforces the Convention on the Rights of the Child issued a policy, General Comment 8, condemning physical discipline in no uncertain terms. Where the United Nations rejects a specific tradition, it may be more difficult for defendants to invoke a cultural defense.

The cultural defense has attracted attention in legal systems across the globe with seminal works by Fabio Basile (2010) and Ilenia Ruggiu in Italy (2013), Pieter Carstens (2009), Tom Bennett (2010), and Christa Rautenbach and Jacques Mattee (2010) in South Africa, and Tamar Tomer-Fishman in Israel (2010). Comparative analysis of the juridical treatment of culture shows that legal systems differ in the extent to which they accommodate expert witnesses who can testify about specific cultural communities and practices. The difficulties associated with evaluating 'cultural' claims raises questions about the criteria by which 'authenticity' of traditions can ever really be determined. Inasmuch as traditions vary and exist in multiple forms, courts have trouble knowing when to accept arguments based on culture (Renteln, 2005).

Scholarship on Cultural Rights

Early scholarship on cultural rights was sponsored by UNESCO through symposia designed to clarify the meaning of culture and cultural rights. In 1950, UNESCO published *Freedom and Culture* which was its first attempt to develop the idea of cultural rights. In 1970, UNESCO sponsored a meeting of experts on cultural rights in Paris to discuss the government responsibilities for sacred places, monuments of cultural significance, and language preservation programs (UNESCO, 1970). As a great deal of emphasis was placed on cultural property, the meeting dealt with the relationship between individuals and cultural objects.

The Interdisciplinary Institute of Ethics and Human Right at the University of Fribourg, Switzerland held a colloquium on cultural rights in 1991. The Council of Europe held the Eighth International Colloquy on the European Convention on Human Rights in Budapest in 1995 on the theme 'Cultural rights: universal, individual, and legally enforceable individual rights.' In 1998 the International Conference on Cultural Policies of Development met in Stockholm, Sweden to evaluate governmental programs designed to ensure that individuals in all communities can exercise the rights guaranteed by Article 27.

In academic circles two parallel scholarly literature emerged on the subject of cultural rights, one in political theory, and the other in international law. Political theorists in the Western tradition analyzed the question of whether cultural rights are compatible with liberalism. For the most part political philosophers worry that the acceptance of cultural rights will lead to 'balkanization,' thereby undermining the unity of the state. The leading proponent of the view that cultural rights can be reconciled with liberalism is Will Kymlicka, a distinguished Canadian scholar. His writings underscore the importance that belonging to a community represents to most individuals.

Despite the fact that his work is generally considered to offer the staunchest support for cultural rights, his defense of cultural rights has been criticized for being too limited. First, Kymlicka advocates the protection of cultural rights only in societies which are said to be structured along liberal lines. His original theory does not provide cultural rights for immigrants who have chosen to move and thereby give up their culture; only minorities long residing in a state and indigenous peoples can legitimately make claims to cultural rights. His interpretation of cultural rights concentrates

mainly on language rights and representation rights. Critics such as Chandran Kukathas have noted that his theory provides minimal protection for cultural rights.

Other leading theorists such as Bhikhu Parekh have attempted to create theories that afford greater protection to cultural rights. In his elaborate scheme advocating 'a principle of dialogical consensus,' Parekh proposes having a minority spokesman, who will engage in a dialogue with representatives of the majority, about cultural practices that clash with 'operative societal values.' It is the duty of the spokesperson to explain how the tradition is authoritative, central to the way of life of the ethnic minority group, and in general, desirable. If it is not feasible to persuade the majority representatives of the value of the tradition under debate and it offends an 'operative societal value,' the ethnic minority must give it up (Parekh, 1996).

Many feminist theorists reject the proposition that cultural rights deserve legal protection because of their concern that protecting these rights will undermine gender equality. Although their work is often framed as a critique of multiculturalism, for example, Susan Okin and Anne Phillips (Phillips, 2009), these analysts are essentially denying the validity of the notion of cultural rights and attacking 'reified' understandings of culture. From the perspective of critical race feminism and postcolonial theory, the use of cultural defense risks 'racializing' disputes by reinforcing false, negative stereotypes about particular groups. Even if some cultural claims are legitimate, they worry that judges are ill equipped to distinguish between valid and illegitimate claims. Generally speaking, most of the commentary on cultural rights in Western political theory is concerned with ways to limit the scope of application of the rights (Kymlicka, 1992; Kukathas, 1992a,b). When cultures do not imprison those who seek to exit, particularly women wishing to flee from oppressive customs, there appear to be fewer objections to the protection of cultural rights. Their objections do not appear to apply to the numerous traditions that have no connection to gender.

In the field of international law, James Anaya, professor of law and special rapporteur on the rights of indigenous peoples has provided a comprehensive analysis of the cultural rights of indigenous peoples and Elsa Stamatopolou a lucid overview of cultural rights jurisprudence within the UN system (Stamatapolou, 2007). A more general theoretical treatment is that of the late Sebastian Poulter whose brilliant scholarship is extraordinarily important (1986, 1998). In Poulter's view, a cultural tradition that violates human rights should not be permitted. According to Poulter, however, if a government, by prohibiting a tradition, is violating human rights, then that tradition should be permitted. His framework has been criticized for presuming the validity of international human rights standards as a basis for determining the validity of traditions and for evading the question of when cultural rights, which are human rights, are superseded by other rights.

Formal Guarantees in Legal Systems

Few national legal systems officially guarantee a right to culture. The extent to which cultural rights are protected depends on whether or not general principles of law such as religious freedom, equal protection, and freedom of association are interpreted to encompass cultural traditions. Because lawmakers are elites from the dominant culture, they tend not to construe abstract principles in such a way as to benefit ethnic minorities. One sign of the preference for monoculturalism is the widespread preference for single official language policies in many countries (de Varennes, 1996; Albanese, 1992).

From time to time, minorities challenge public policies that they regard as unwarranted intrusions into their way of life (Tahzib, 1996). For example, in France the Muslim community objected strenuously to the ban against wearing the *hijab* or headscarf in French public schools (Poulter, 1997). The national controversy was known as *L'Affaire des Foulards* (Gaspard, 1995; Bowman, 2006). The policy was justified because it ensured the separation of church and state, the integration of foreigners into French society, and gender equality. Some women's groups in France thought the Muslim religious garb, the headscarf, symbolized the subordination of women. Eventually, after litigation, the Education Minister relented, allowing the children to wear their religious attire to school.

In the aftermath of L'affaire des foulards, innumerable conflicts occurred over religious garb throughout Western Europe. A vast literature reflects the extent to which visual symbols accentuate differences between groups. In litigation judges in both national courts and the European Court of Human Rights generally accept the state interest in regulating the dress, which is often expressed in terms of protecting national security. The trend toward banning the burqa after 9/11 in Europe and North America sparked heated debate about whether the dress regulations reflected Islamophobia (Bakht, 2012). Maleiha Malik's incisive analysis of these disputes highlights the underlying policy of persecution they support (2014).

In the United States and Canada indigenous peoples have challenged development projects that would undermine their way of life (Eisenberg, 2013). In Lyng v. Northwest Cemetry Protective Association, 1987, tribes argued that the construction of a highway through Chimney Rock would desecrate sacred sites. As part of an environment impact study, the government hired an expert who advised against building the road because of its devastating effect on the tribes. Despite the admonition, the government proceeded with the project, undeterred. The US Supreme Court ruled that the burden on the religion was incidental, not the purpose of the development, and that religious minorities have to accept some burdens.

Difficulties in domestic litigation generally have to do with the question of what counts as the 'authentic' culture or whether a specific practice is 'traditional.' In order to determine the authenticity of cultural traditions, there is the related issue of who is the legitimate representative of the group. Sometimes, indigenous people find offensive the practice of consulting 'experts' or scholars rather than leaders of their communities. Even when the groups themselves are the source of information, it is not always obvious which person from within the group speaks for the group.

Two examples show the practical difficulties in litigating cultural rights claims.

In France the government made an exception to its animal slaughter law to permit Orthodox Jews to slaughter animals in accordance with religious law so that they could consume the meat. France empowered the Central Rabbinical Committee to handle the implementation of the policy. However, one group of Orthodox Jews, concerned that the method employed for the ritual slaughter of animals was not guaranteeing that the meat was sufficiently pure or *glatt*, sued France, challenging its delegation of authority to the Central Rabbinical Committee. After French courts ruled against the group, it appealed to the European Court of Human Rights, where it lost as well.

The Hindmarsh Bridge Island litigation in Australia also shows the dynamics of intragroup tension (Weiner, 1999; Tonkinson, 1997; Lyndall, 1996). A group of aboriginal women objected to a proposed bridge between the Australian mainland and Hindmarsh Island because they claimed it would jeopardize their way of life. The island was ostensibly used for secret women's business, and their customary law supposedly prevented them from divulging information about the nature of the business. During the litigation another group of aboriginal women held a press conference denying the veracity of this claim, saying there was no such 'secret women's business.'

In contrast to domestic litigation that relies on abstract principles interpreted to apply to culture, in international law explicit protections for culture can be found. Among them are the International Covenant on Economic, Social, and Cultural Rights, particularly Article 15, the Declaration on the Rights of Persons Belonging to National or Ethnic, Religious, and Linguistic Minorities (1992), the Framework Convention for the Protection of National Minorities (1995), and the European Charter for Regional or Minority Languages (1992). In addition, there are related documents such as the Declaration on the Rights of Indigenous Peoples finally adopted in 2007 and the Declaration on the Elimination of All Forms of Intolerance and of Discrimination Based on Religion or Belief (1981). Cultural rights are covered not only by human rights treaties, but also by many instruments concerned with safeguarding cultural heritage such as Convention Concerning the Protection of the World Cultural and Natural Heritage (1972), the Convention on Underwater Cultural Heritage (2001), and the Convention on the Safeguarding of Intangible Cultural Heritage (2003).

In the twentieth century the most important cultural rights provision was found in the International Covenant on Civil and Political Rights (ICCPR), a treaty ratified by virtually all countries in the world. This provision is not subject to any reservation (except for France's), that enables a government to avoid obligations under the article. Article 27 provides:

> In those states in which ethnic, religious, or linguistic minorities exist, persons belonging to such minorities shall not be denied the right, in community with the other members of their group, to enjoy their own culture, to profess and practice their own religion, or to use their own language.

However, Article 27 cannot serve as a guide to determine the substantive meaning of cultural rights under international law because it has been interpreted in only a few situations. The provision has been applied mainly to protect sacred land, the right to hunt animals, and language rights.

Although it is widely referred to as a 'minority' rights provision, it is often invoked in cases involving indigenous peoples, many of whom do not consider themselves to be minorities, subordinate to a state. Some members of indigenous groups object to its application in their cases. Article 27 has also been criticized for being formulated as an individual right and as a negative right. These criticisms may be unwarranted: first, the provision can be invoked by individuals or groups; second, if communities only need to invoke a juridical right to culture when governments threaten to halt their practices, it makes sense that the provision was expressed in negative terms: 'governments shall not deny ….' Moreover, because there was some question about the nature of government obligations for the protection of cultural rights, the Human Rights Committee, which enforces the ICCPR, issued a policy statement interpreting Article 27, known as General Comment 23(5), stipulating that governments take affirmative steps to enforce cultural rights.

One of the best-known disputes in international law in which cultural rights were invoked was the celebrated Lovelace decision that was based on Article 27 of the ICCPR. Sandra Lovelace was a Maliseet Indian who married outside the tribe, thereby losing her tribal status (if a male Maliseet Indian married someone not belonging to the tribe, he would not lose his status). After her divorce, she was unable to rejoin the band as a full-fledged member. She sued unsuccessfully in the Canadian courts and subsequently filed a complaint with the Human Rights Committee. Although she challenged the sexist membership rule, alleging that it violated human rights law and the tribe defended itself by invoking the right to self-determination (Article 1 of the ICCPR), the Human Rights Committee decided that she had been denied the right to enjoy her culture in her community. Interestingly, this case stands for the proposition that women also have a right to culture!

The first human rights treaty of the twenty-first century is the Convention on the Rights of Persons with Disabilities, adopted in 2007, and ratified by virtually all states. Article 30 provides a comprehensive elaborate cultural rights provision. The interpretation of the cultural rights of persons with disabilities includes the right to participate in meaningful ways in the arts, education, and science and raises questions about what types of disability culture deserve legal protection as well.

In the final analysis, the main challenge in international human rights jurisprudence is how to evaluate the relative importance of cultural rights vis-à-vis other human rights. This is known as the hierarchy problem. There are rights conflicts between treaty regimes, for instance between Article 27 and provisions of the Convention on the Elimination of All Forms of Discrimination Against Women which require governments to abolish all traditions that interfere with gender equality. The UN appointed Mrs Halima Embarek Warzazi in 1988 as Special Rapporteur on Traditional Practices Affecting the Health of Women and Children. Her studies recommend the elimination of traditions with adverse consequences for women and children including female

genital cutting. For the most part, fundamental rights conflicts within the UN system have not been resolved to date, and the debate centers on what constitutes a harmful traditional practice. In 2009 the UN appointed a special rapporteur on cultural rights, Ms. Farida Shaheed, to identify best practices for the promotion of these rights and complete a series of reports.

Despite modest gains in recognition of cultural rights in domestic and international jurisprudence, this legal protection remained in a precarious position (Renteln, 2014). As the wider public became aware that judges were engaged in application of customary law and the consideration of cultural traditions, a backlash emerged. In some states, for example, voters in the United States passed state referenda, for instance, in Oklahoma banning any consideration of Islamic law. When these measures were subsequently subject to legal challenges, courts sometimes struck them down as unconstitutional (Ceasar, 2012). Not only in violation of fundamental principles of law and international human rights standards, the ban on the consideration of religious law would make it virtually impossible for judges to resolve some legal questions.

Another way of addressing cultural rights claims has been delegating them to religious arbitral boards. Attempts to achieve formal recognition of legal pluralism generated controversy in both England and Canada (Bakht, 2006). Establishing institutional mechanisms to settle particular family law claims in accordance with customary or religious law may facilitate dispute settlements in a manner consistent with national and international law. Yet, because of fear that subnational bodies will fail to adhere to legal principles enshrined in national legal systems, there has been a reluctance to move in the direction of formally authorizing religious arbitration boards.

Theoretical Challenges for the Future

Regardless of whether or not domestic and international legal systems afford adequate protection to cultural rights, the right to culture may be important because abstract principles require it. Appeal can be made to many principles to justify the recognition of cultural rights; among these are identity, freedom, and tolerance. Cultural considerations are likely to influence the disposition of all manner of disputes including criminal and civil litigation as well as a range of conflicts occurring within government agencies and privatized dispute resolution mechanisms.

If culture is intrinsically linked to the formation of identity, then any general notion of individual or group rights requires that culture be protected, at least to some degree. To the extent that democratic systems are committed to the principle of noninterference by the government, intervention in the folkways of cultural communities in the absence of any serious threat would seem illegitimate. The notion of freedom would appear to compel the acceptance of cultural rights in many spheres. Finally, the idea of tolerance is widely considered an important one in liberal democracies. Although tolerance has somewhat pejorative connotations, that is, 'putting up' with practices with which one disagrees, allowing the flourishing of diverse cultural traditions is consonant with this principle.

Even if the right to culture is established as a fundamental right, it remains to be seen how much importance it has vis-à-vis other human rights. The hierarchy question is likely to occupy the attention of scholars interested in the nature and scope of cultural rights. Fortunately, many scholars across the globe have turned their attention to these pressing cultural concerns.

Abstract

Cultural sociology reaches back to classical thinkers in sociology. In the wake of the 'cultural turn,' cultural sociology constitutes itself drawing on various theoretical resources from the social sciences and humanities: critical theory, cultural anthropology, phenomenology, structuralism, and poststructuralism among others. After its institutionalization in major associations during the 1980s, cultural sociology today represents a vibrant subfield and in some ways a paradigm that permeates other areas of sociological inquiry.

This article looks at cultural sociology in two ways: as a history of thought and process of institutionalization. Cultural sociology will be traced from its early precursors in classical social theory, to its more immediate but still preconscious theoretical foundations of the twentieth century and to the differentiated field it has become since the late 1980s. It discusses some of its central structural characteristics and the final section focuses on how cultural sociology was established as a subfield and explains why this occurred in the 1980s.

Classical Precursors of Cultural Sociology

Karl Marx is certainly not on the forefront of our minds when we think about precursors of cultural sociology. Particularly his early writings, however, were influential for later cultural theorists, most notably Antonio Gramsci, the Frankfurt School, and British cultural studies (subsumed as Cultural Marxists). With the younger Marx (especially *German Ideology* and *The Economic and Philosophical Manuscripts*), these later thinkers share a concern for demystifying ideas (or: ideologies) as expressions and veneers of dominant interests. In other words, this understanding led to analyses of culture as a means of domination.

Emile Durkheim, particularly in his later, less positivist incarnation in *Elementary Forms of Religious Life*, was more directly influential for one particular strand of contemporary cultural sociologists who adopted a structuralist theoretical framework. But even earlier than that, one reading of Durkheim's idea of solidarity in *Division of Labor in Society* suggests that society is the collective conscience of shared moral commitments. More central to recent cultural sociological thinking is his theory of religion in *Elementary Forms*, which is defined by ideas about sacred and profane. Profane refers to the everyday whereas the sacred means matters connoted with awe or fear. The sacred is separated from the profane by taboos and draws power from rituals. Rituals, in turn, create solidarity and thus integrate societies. Although Durkheim mainly talked about religion, he believed that this moral foundation also applies to secular societies. In his earlier book *Primitive Classification*, which he co-authored with Marcel Mauss, he argued that classification is not only cognitive but most importantly moral and emotional.

Max Weber is important for cultural sociology especially (but not exclusively) for his interpretive method of 'verstehende Soziologie' and his emphasis on value-rational ('wertrational') forms of social action. Furthermore, Weber assigned culture a key role in social change but less for social reproduction and stability. His notion of charismatic authority, for instance, which is based on the collective belief in exceptional qualities and powers of a leader, is transitory and relevant for changes of power structures. Although he spent almost the entire book *The Protestant Ethic and the Spirit of Capitalism* on arguing how specific ideas of salvation in Protestantism fostered a capitalist ethos, in essence, religion becomes irrelevant once capitalism is in place and organized by rational systems of authority. Weber's theory of stratification, which distinguished material/economic *class* from symbolic *status*, would become central for later cultural sociologists, particularly Pierre Bourdieu. Of the classical thinkers Weber was the greatest inspiration for multidimensional explanations of historical conditions, accounting for material, social, and ideal factors.

Georg Simmel is certainly the 'most cultural' founding father of the discipline with his detailed and diverse analyses of modern life. However, for lack of a systematic theory he is less important for macro-oriented cultural sociologists than for symbolic interactionists, particularly the Chicago School. Another important precursor, especially for poststructuralist thinkers like Michel Foucault and Gilles Deleuze, was Friedrich Nietzsche; especially, his emphasis on cultural differentiation and cultural relativism as well as an early theory of embodiment.

Of course, none of these thinkers were 'cultural sociologists,' nor did they refer to cultural sociology as an intellectual endeavor. The first sociologist to use the term (i.e., 'Kultursoziologie') was Max Weber's younger brother, Alfred Weber. In contemporary cultural sociology beyond the German-speaking world he is irrelevant, however. Another important thinker for later cultural theorizing in sociology is Talcott Parsons, even though he may be indirectly responsible for a temporary culture-averseness of sociology, at least in the United States. Parson's theory opposed a rational actor model and perceived the cultural system as one subsystem that integrates society. To Parsons, the cultural system was a realm of communicative exchange and coordination of action through stable role expectations that are based on general values. These values and the assumption of a consensus about them were the central

 http://dx.doi.org/10.1016/B978-0-08-097086-8.03059-2

features of his theory and a major point of the critique that followed and culminated in the 1960s. The response of the sociological mainstream in the United States for the better part of two decades had been not to consider culture worth paying attention to at all.

Theoretical Foundations of Cultural Sociology

There are at least six intellectual currents in the twentieth century, which would become important for cultural sociology subsequently. These are (1) a particular reading of Marx (termed Western/Cultural/Humanist/neo-Marxism); (2) (late) Durkheimian social theory; (3) semiotics and French structuralism; (4) poststructuralism; (5) cultural anthropology; and (6) phenomenological sociology:

1. Two scholars were instrumental for promoting Marxist thinking beyond historical materialism and toward a more important role of culture in capitalist domination: Georg Lukács with his work on commodification (and his reconsideration of Marx' *Economic and Philosophical Manuscripts*) and Antonio Gramsci with his theory of hegemony, which emphasized that domination is conditioned by control of ideas and beliefs in society. This Marxian thinking was taken up by the first generation of the Frankfurt School, most notably Theodor W. Adorno, Max Horkheimer, and Walter Benjamin. One of their concerns was the reproduction of popular culture through new technological means and its impact on mass society, which is to impede critical thinking and purvey capitalist ideology. While it played on values of individuality and freedom of choice, popular culture was in fact standardized by capitalist logic, they argued. Louis Althusser established a more cultural reading of Marx' later writings. He focused on how the constituent parts of the superstructure – ideology, state, and the legal system – interact to reproduce capitalism, arguing that they have a 'relative autonomy' from their economic base. Ideas and institutions take shape according to their own logic but the economy defines their boundaries. What unites these theorists is that they assign importance to culture as an object of investigation, though only in terms of ideology. From this viewpoint, culture prevents us from critically assessing circumstances of our lives and traps us in false consciousness.
2. The scholar who directly continued the legacy of Durkheim's later work is his nephew, Marcel Mauss. In his best-known work *The Gift* he argued that gift exchange is central in all societies around the world. Although the exchange often involves commodities, their material worth is secondary to the symbolic value and normative obligations they imply. Maurice Halbwachs would be another Durkheimian scholar of this generation whose work shows that collective memory is a central source of solidarity in societies. In the second half of the twentieth century, the most important intellectual figures advancing Durkheimian cultural theory were cultural anthropologists, particularly Mary Douglas and Victor Turner, as well as sociologist Robert Bellah. Turner offered a theory of cultural change with his concept of liminality, which is a transitional state characterized by a low degree of structuration. As opposed to Durkheim's notion of anomie, the liminal state is defined by the weakening of social distinctions and fostering of creativity. During these moments, Turner argued, communities defined by equality and solidarity are formed (communitas). Mary Douglas was interested in cultural classification and took up Durkheim and Mauss' work on this issue to study symbolic purification and pollution as foundations of social order. What is considered dirty and disgusting may vary across cultures but is not random, she argued. Instead, beliefs about pollution are based on rules of classification and are enforced by rituals of separation of pure and impure. Robert Bellah argued in his famous essay 'Civil Religion in America' that all collective beliefs have a religious dimension, even though they may concern secular issues. Public life, according to Bellah, is structured by religious-like beliefs, which refer not only to Judeo-Christian ideas but national symbols imbued with sacral meaning (e.g., Statute of Liberty in the United States, Brandenburger Tor in Germany, and Marianne in France).
3. Structuralism contends that human experience is rooted in foundational mechanisms, which are patterned by language and call for objective study. Cultural analysis based on structuralism studies culture 'like language.' Human agency, which actualizes language through speech, is irrelevant in such analyses. Structuralism is particularly indebted to structural linguistics of Ferdinand de Saussure. He distinguished *langue* (language) from *parole* (speech), focusing exclusively on the former, and further differentiated between signified (that which is referred to by language) and signifier (that which refers). His central argument is that the relation between signifier and signified is arbitrary but conventional. The task is, therefore, to understand these conventions of signification, which are always structured by opposition. Building on Saussure's structural linguistics, the main reference point for structuralism strictly speaking is Claude Lévi-Strauss. His main objects of study were mythical thought and rituals, which he decoded as cultural classification systems, structured by similarity and difference. Lévi-Strauss' theory of culture thus has resemblance with that of Durkheim, although he hardly referred to him in writing.

   Roland Barthes completed the intellectual move of structuralism to use semiotics for the study of culture. He insisted that the basic linguistic distinctions between langue and parole, signifier and signified, can be applied to all cultural systems. Fixing one often criticized weakness of Lévi-Strauss' theory, which is that it is static, Barthes added a diachronic (he called it *syntagmatic*) element to the analysis of signs, namely by examining narratives. Furthermore, he argued that signifiers do not just denote signifieds but also other signifiers. As opposed to denotation (first order signification), Barthes referred to higher orders of signification as *connotation*. By layering connotative meanings on top of each other, signifiers get a life of their own. To Barthes, signs are not innocuous but part of ideological systems, which he showed most forcefully in *Mythologies*. He stressed that semiotics must be combined with sociological analysis to examine how sign systems, such as myths, help to justify and reproduce social orders. Thus, besides his

many other contributions, Barthes added a critical dimension to structuralist analysis.

4. Partly pioneered by Barthes, poststructuralism is a diverse intellectual movement seeking to refine structuralist thinking. Like structuralism, poststructuralism is concerned with language and symbolic forms, such as narratives, myths, and cultural codes. It is not concerned with the sovereign individual but how subjectivities are affected by semiotic systems under certain historical circumstances (in contrast to structuralism). In opposition to Saussure and continuing Barthes' concept of connotation, poststructuralism rejects the separation between signifier and signified, arguing that signifieds are themselves always signifiers. In contrast to structuralism, poststructuralism is more critical about its own conditions of knowledge production and the notion of the analyst as an objective observer. Related to this, poststructuralism is more sensitive to how cultural systems are affected by power. On the one hand, power is examined as the ability to prise cultural systems open. On the other hand, it asks how power closes cultural orders and makes them appear natural. This is what Foucault's idea of 'dispositif' is concerned with, for example, which subsumes the entanglement of institutional and discursive orders that limit and predetermine what is considered normal and abnormal. A fundamental analytical move of poststructuralism is that it looks at symbolic orders as distinguished from an outside 'Other,' which is necessary to define and sustain its boundaries.

   Michel Foucault made the transition from structuralism to poststructuralism in his own work by increasingly focusing on the power formations generated by expert discourse. In his theory, discourse controls thought and practice and, as in structuralism, human agency is extraneous. Aside from his growing interest in power relationships, his attentiveness to historical processes always distinguished his work from the structuralist tradition. Foucault's analysis of discourse traces the underlying epistemic assumptions and truth claims as well as institutional formations and practices that followed from it. One element that unites his claims about history and power is that there is a transition in modernity from sovereign power (based on hierarchy, physical, public, and ritualized forms of punishment) to disciplinary power (based on surveillance and rationality), which is more profound by altering and controlling behavior, thinking, and bodily functions from within. In contrast to Marxist thinking of ideology, Foucault's theory is free from taken-for-granted assumptions about the basis of discourses and allows more analytic autonomy, which makes it a central reference point for cultural sociology.

   Another central figure in poststructuralism is Jacques Derrida whose work tackled the act of interpretation of texts. In the first instance and in accordance with de Saussure, meanings are always generated through contrast with absent signs ('silences'). Derrida insisted on the multiplicity, contextuality, and endless proliferation of meanings of texts rather than ultimate, fixated meanings asserted by the (structuralist) analyst. Derrida demonstrated that even the most canonical texts can be interpreted in ways that accrue not only alternative but contradictory readings. Texts thus have certain autonomy from their authors' intentions and are always ridden with ambiguity. A search for 'truth' in texts is thus pointless and instead the analyst should engage in deconstruction, that is, in playful hermeneutic interpretation that screens texts from many different angles. Furthermore, the goal of this undertaking is to examine the ways (different) people make sense of texts (in different ways).
5. Besides Mary Douglas and Victor Turner, another cultural anthropologist had significant influence on the cultural turn of the social sciences in general and cultural sociology in particular: Clifford Geertz. Influenced by Max Weber's interpretive method as well as Talcott Parsons emphasis on cultural values and norms, Geertz advanced a hermeneutic approach to culture. During his extensive ethnographic explorations in Indonesia and Morocco, he developed a perspective that considered culture as permeating every aspect of our lives and as worthy of study in its own terms and in an interpretive fashion. The result is a 'thick description,' a densely textured and ethnographic depiction of meanings and experience in local settings, which draws larger conclusions about the culture in question. Geertz, however, shied away from broader theoretical claims beyond the cultural contexts of his studies. Later cultural sociologists would take up this challenge.
6. Phenomenological approaches, such as symbolic interactionism and ethnomethodology, are further influences of cultural sociology. Thinkers associated with these intellectual movements insist on the situational construction of meaning by human agents. For cultural sociologists interested in semiotics, the influence of these works is limited. For others, Alfred Schütz, Peter Berger, and Thomas Luckmann, as also Erving Goffman, Harold Garfinkel, and Harvey Sacks stand as important influences (this is particularly visible in certain strands of science and technology studies, for instance).

Cultural sociologists draw on these intellectual resources with varying degrees. They take from cultural Marxism a concern with critical theory of how culture helps reproduce capitalist orders. They take from Durkheimian thinking a concern with culture as a basis of social cohesion, with rituals as practices to reinvigorate it and a conception of society as a moral accomplishment. They also focus on the binary logic of systems of cultural classification, quite similar to structuralism, which provides more concrete guidelines regarding as to how to go about studying culture. Durkheimian, structuralist and poststructuralist thinking as well as Geertz' cultural anthropology emphasizes culture as an autonomous object of study. Poststructural thinking inspired cultural sociologists to engage in rigorous hermeneutic inquiry and critique of discourses that claim closure and classification (which would become particularly fruitful in queer, gender, ethnic, and postcolonial studies). Phenomenological approaches, finally, have been important to those who focus on cultural practice.

Contemporary Variants of Cultural Sociology

An immediate reference point in cultural sociology is the work of Pierre Bourdieu, which had global impact during the past 20 years of his life and is even more influential now, more than

a decade after his demise. Especially his books *Distinction* and *Rules of Art* as well as the essay collection *The Field of Cultural Production* had a remarkable influence on cultural sociology. His theory provides a comprehensive conceptual repertoire, which lends itself for operationalization in empirical research and examination of culture on different levels of analysis. For cultural sociology, especially helpful are (1) his theory of social stratification and the importance of cultural capital for the attainment and reproduction of social status, (2) his concept of habitus, particularly for ethnography that seeks to make arguments beyond the micro-social and relate structure and agency, and (3) his notion of field as a way to examine the logic of cultural institutions.

British cultural studies are a preceding and parallel intellectual movement, which cultural sociology seeks to distinguish itself from by demonstrative ideological agnosticism and more social scientific empirical methods. Aside from intellectual specificities, cultural studies are defined by a different institutional configuration: it is a more interdisciplinary subfield; it has a higher degree of autonomy (e.g., there are departments of cultural studies); it used to have an organizational center until 2002, namely The Birmingham Centre for Contemporary Cultural Studies (CCCS, founded in 1964). Cultural studies were influenced by cultural Marxism and the New Left, later structuralism and poststructuralism. Important early thinkers were literary critics Raymond Williams and Richard Hoggart (who founded CCCS). The central intellectual figure from the 1970s onward was Stuart Hall. Arguments for the autonomy of culture and interest in power formations promoted by culture are central concerns for cultural studies. Scholars focused on the textual study of political ideology, popular culture, and mass mediation of ideologies as well as ethnographic studies of subcultures. Cultural studies spread from the United Kingdom all over the Anglophone world during the 1980s.

In US cultural sociology, there are two contrary understandings (bracketing 'sociology of culture' for now) of the purpose of culture in sociological analysis, which had wider impact. We may call the first a pragmatist theory of culture and contrast it with a structuralist/semiotic approach.

The paradigmatic formulation of the pragmatist approach to culture is by Ann Swidler who, building on Max Weber, conceptualized culture in an early and often-cited article as a repertoire for constructing strategies of action (also known as the 'tool-kit' approach to culture). In her understanding, symbolic systems are especially important at times of transition and instability ('unsettled times'). Similarly to this conception of culture as a resource, works inspired by Bourdieu treat culture as a means in struggles for power. Works concerned with framing (in David Snow's adaptation of Goffman's original conception of frame analysis) examine social mobilization and claims-making in the public sphere through the strategic construction of meaning (frames). New institutional theory would also belong to this category as it treats culture as a source for legitimacy for organizations, which are competing for market share and state funding. Hence, this approach has wide resonance with works that attribute analytic value but no real explanatory power to culture. One epistemological root for this understanding of culture is a principal division of human experience in social and cultural domains, which is also a common feature of cultural studies.

One key reference point for the structuralist/semiotic approach to cultural sociology is the 'strong program in cultural sociology' (subtitled 'structural hermeneutics') by Jeffrey Alexander, his former students and collaborators. This approach is exemplary for its centrality in the field and programmatic expansiveness. It is institutionally located at the Center for Cultural Sociology at Yale University. Its main theoretical foundations are Clifford Geertz, Max Weber, French structuralism, and late Durkheimian social theory. The strong program is not only a critique of cultural sociology but sociology altogether by arguing that culture is an important constituent of all social relations and that a meaning-centered analysis is thus necessary in all areas of sociological inquiry. The strong program emphasizes cultural autonomy, which requires analytically bracketing out the nonsymbolic, at least in the first instance and before discerning how culture relates to other efficacies. The object of empirical research is typically public discourse, which is subjected to a kind of textual ethnography aiming at thick description of the social realm in question. In accordance with structuralism and Durkheim, this style of cultural sociology emphasizes the binary logic of meaning. It is not static, furthermore, but stresses that meaning is generated sequentially by considering narrative as one key analytical component. Other important theoretical interventions by the strong program were a cultural theory of collective memory (cultural trauma), an approach to study cultural pragmatics (cultural performance) and, most recently, visual culture and iconicity.

The Institutionalization of Cultural Sociology

In the 1980s, the first sections for cultural sociology were founded in disciplinary associations. The cultural sociology section in the German Sociological Society, for instance, was established in 1984 under the name 'Kultursoziologie in der Deutschen Gesellschaft für Soziologie.' At its inception, it was defined by political conservatism and an aspiration to strengthen the German *geisteswissenschaftliche* tradition in sociology. The sociology of culture section in the American Sociological Association followed suit in 1987. Why at that time? The simple answer is that institutional differentiation of the discipline within associations really began only in the 1970s. Besides these associational reasons, differentiation and self-awareness of cultural sociologists occurred in opposition to the sociological mainstream, which was perceived as too scientistic and materialist at the time. In particular, the emergence of cultural sociology was a response to anti-Parsonianism in the sociological mainstream, which prevailed from the late 1960s until the 1980s, not only in the United States but also in Germany. This posture rejected not only the abstract and consensual values envisioned by Parsons but culture in general.

Another important current for the rise of cultural sociology was the 'cultural turn,' which began to take hold in the social sciences in the 1960s. During that turn, disciplines became more susceptible to theorizing in other social scientific fields and especially the humanities. The cultural turn was itself enabled by the 'linguistic turn,' rooted in structural linguistics

of Ferdinand de Saussure and Ludwig Wittgenstein's later philosophy of language, which led scholars in the social sciences and humanities to take language and symbols more seriously.

Besides intellectual developments (but certainly related to them), the historical context for the growing importance of culture as a subject matter of social science was the ascendant postindustrial logic in Western societies of the second half of the twentieth century as well as the counter-cultural and social movements that arose in the 1960s. Although cultural thinking in sociology started much earlier, it seems that it could only really thrive under these historical circumstances, in which we see a rise of 'expressive individualism' (Bellah), an emphasis on consumption and experience and a growing emphasis of identity and symbolic representation in public debate. The perceived dissolution of formerly rigid social categories and a growing sense of ambivalence and contingency necessitated new analytic tools to examine this new condition.

In the United States, the emergent field was structured by internal discussions about the object(s) of study from the beginning. Some sociologists, most notably Howard Becker, Diane Crane, Paul DiMaggio, Wendy Griswold, and Richard Peterson studied culture as an object of production and consumption, which is shaped (and explained!) by other social conditions. This became known as the *sociology of culture* approach. Howard Becker's book *Art Worlds*, for example, argues that art is conditioned by previously reached conventions (and their calculated breach), which shape both the aesthetics of artifacts and the cooperative arrangements necessary for producing them. Many works in this field are influenced by Pierre Bourdieu, focusing on class and status hierarchies in the production and consumption of culture. A well-known exemplar is Richard Peterson's research, which showed that people in privileged positions are better conceived as 'cultural omnivores' than mere snobs, as Bourdieu's homology argument suggests (higher strata exclusively consume high-brow culture). Omnivorousness is not understood as a liberal attitude but a new mode of distinction, which is based on cultural relativism and the ability to criticize a wide spectrum of cultural forms based on knowledge about them.

Opposite sociologists of culture, other scholars considered themselves cultural sociologists. They share a more expansive vision of the field, both in terms of intellectual influences and subject areas of study. They read cultural anthropology, cultural history, cultural studies, and (post)structuralism and seek to make interventions in other areas of sociology from a cultural perspective. Viviana Zelizer is considered as one of the founders of this sociological approach with her early research on the importance of cultural meanings in the insurance business and money economy (published in the 1970s and 1980s). Eviatar Zerubavel published on the temporal structuring of everyday experience as a powerful collective representation around the same time.

The intellectual dynamics of the new subdiscipline in the United States was defined by debates between those two camps, sociology of culture and cultural sociology, which were particularly intense during the 1990s. A central issue of debate was the role of culture in sociological analysis, essentially causality and autonomy of culture. Sociologists of culture treat culture as a dependent variable to be explained by other social or material forces. In cultural sociology, it is the opposite; that is, culture does the explaining or at least a significant part of it.

In Germany, in comparison, the broader understanding of cultural sociology was dominant from the beginning. One reason is that the leading figures, most notably Friedrich Tenbruck and Wolfgang Lipp, set the direction more forcefully in a special issue of the *Kölner Zeitschrift für Soziologie und Sozialpsychologie* where they defined 'Kultursoziologie' as concerned with "general patterns of meaning, which give action stability and significance, explicitly and implicitly, as preconditions and intentions across all areas of life and institutions" (Lipp and Tenbruck, 1979: 395; my translation). Such a defining intervention has not occurred at the inception of the subfield in the United States, or rather: there were multiple interventions, which were subjected to controversy with no immediate resolution. From the 2000s onward, however, cultural sociology became dominant in numbers and directions of the subfield.

Sociology of culture and cultural sociology are now somewhat divided into different journals, *Poetics* preferred by the former, *Cultural Sociology* – an official journal of the British Sociological Association – and the more recent *American Journal of Cultural Sociology* by the latter. Although a cultural studies venue, *Theory, Culture & Society* is also an important outlet for cultural sociological thinking. The field, especially sociology of culture, also enjoys some visibility in flagship journals in US sociology, *American Journal of Sociology*, and *American Sociological Review*. Important theoretical interventions in cultural sociology appeared in *Sociological Theory* and *Theory & Society*. Cultural sociologists have been successful publishing their work with top university presses from the beginning, above all Oxford University Press, Cambridge University Press, and the University of Chicago Press, which have remained important publishing venues for the field. Oxford University Press and Routledge have recently published handbooks on cultural sociology and Blackwell published one on the sociology of culture.

Cultural sociology as it is constituted today is engaged almost in all subfields of sociology, even in subject areas that are most 'material' by definition (economic sociology, criminology, and so on). Disciplinary boundaries are typically rigid in the United States. In Germany, for instance, cultural sociology is embedded in the broad field of 'Kulturwissenschaften,' which takes institutional form in intra- and extra-academic research institutes (similar to cultural studies but less politically oriented). German cultural sociologists are thus subjected to a more interdisciplinary debate to begin with. Cultural sociology in the Anglophone and international context, although it is infused by ideas from other disciplines (as mentioned above), still lacks such branching-out efforts, which could be a direction of the field in the future.

Abstarct

Cultural studies of science, a multidisciplinary field drawing from history, anthropology, feminist theory, sociology, and philosophy of science, treats scientific practices as historically situated, meaningful patterns of interaction with the world. Rejecting many shared assumptions in debates among sociological constructivists and internalist philosophers of science, cultural studies seek interpretive, critical engagement with specific scientific practices rather than global legitimization or critique of science. Their commitment to dynamic, expressive conceptions of meaning, knowledge, and power is primarily articulated through detailed studies of particular practices, performances, or institutions. Their foci include laboratories or field sites; images, models, and metaphors; machines and procedures; and patterns of exchange among scientific work and other sites of meaning-articulation. These studies are situated within the Acultures of science that they investigate, and aim at responsible, mutually transformative interaction with scientific practices rather than explanation of their outcomes.

'Cultural studies of science' marks a loosely amalgamated, multidisciplinary research field drawing from history, anthropology, feminist theory, sociology, and philosophy of science. Its participants emphasize that scientific practices are historically situated, meaningful patterns of interaction with the world. Cultural studies offer an interpretive, critical engagement with scientific practices, rather than an explanation of their outcome. Cultural studies are situated within the 'cultures of science' that they investigate, and are responsive to what is at stake in the ongoing development of scientific practices.

The Place of Cultural Studies within Science Studies

Cultural studies of science first emerged in the late 1980s and early 1990s in response to debates between proponents of internalist history and philosophy of science, and adherents of the 'Strong Program' in the sociology of science. These debates concerned how best to explain the content of scientific knowledge, either by appeal to rational norms or as the outcome of particular social interactions. The stakes in these debates over explanatory strategies seemed to concern the authority of scientific claims, their relation to the natural world, and the normative stance of the explanation itself. With respect to scientific authority, philosophical accounts typically vindicated the acceptance of scientific claims or research programs as rationally warranted or reliable, whereas constructivist sociological work emphasized the contingency of scientific work and the impossibility of rationally foreclosing alternative interpretations. Meanwhile, scientific realists argued that scientific claims were accountable to the world as independent of human language, experience, or social practice, while antirealists (including both sociological constructivists and philosophical empiricists and historical rationalists) insisted that the sciences could never reach beyond our categories, practices, and norms. Finally, classically normative accounts of science aspired to assess the adequacy of scientific practices according to philosophical norms, while philosophical and sociological naturalists proposed primarily to describe (and perhaps explain) how the sciences actually proceed.

Work in cultural studies proceeded differently, in ways that rejected assumptions shared by most participants in these debates between internalists and social constructivists (assumptions that are also implicit in classic works of social history, such as Forman, 1971 or Shapin and Schaffer, 1985, that are otherwise thematically congenial to cultural studies). First, cultural studies are strongly antiessentialist about the sciences: there are no goals, methods, products, or norms belonging to science as such. Such antiessentialism undercuts the explanatory projects of both internalist philosophical histories and of a programmatic social constructivism, which are committed to accounting for the sciences as knowledge-producing activities (where 'knowledge' is a distinctive kind of product, either rationally warranted, causally reliable, or socially authoritative belief). The sciences are historically evolving practices, such that past and present practice cannot fix their nature, significance, aim, or 'content.'

Cultural studies also find no clear boundaries between scientific content and its social context. Both philosophers and sociologists have identified the shared commitments and norms of scientific communities as the locus of their divergent explanatory projects. Cultural studies have instead emphasized both an 'internal' heterogeneity that belies any presumption of community within a scientific field, and an active traffic in meanings and material across any supposed boundaries between scientific communities and their social or cultural contexts. This absence of community-defining consensus also exemplifies a more fundamental issue: cultural studies take the subjectivity of scientific knowers to be part of what needs to be understood rather than as an explanatory resource. Neither the natural body, the rational faculties, or the social identity of a scientist can be taken for granted as the locus or source of agency and belief. Prosthetic embodiments, narrative re-enactments, discursive interactions, and the affordances of material surroundings instead constitute knowing subjects through scientific practices, rather than accounting for practices as the doings of human agents/believers.

The opposing positions in the realism debates thereby dissolve. The question whether human knowers can ever get beyond the confines of their mental or social representations in order to be accountable to natural objects presupposes the

autonomous intelligibility of mental or social representations. Cultural studies take scientific practices to be always already materially engaged and discursively articulated, so that there is no confinement within experience, language, theory, or social world to be transcended. On the contrary, experience, language, theory, and social forms themselves only take on determinate form through ongoing patterns of 'intra-action' in the material world (Barad, 1996 coins this term to avoid the connotation that 'interactions' involve agencies definable apart from their inter-action). But the same is true of 'nature,' whose objects and capacities only acquire determinate articulation in phenomena, ongoing patterns of 'material-semiotic' intra-action (Barad, 1996; Rouse, 1996; Haraway, 1999).

The dispute between normative and naturalistic (descriptive) approaches to scientific practices also turns out to share false presuppositions. Cultural studies agree with naturalists that there can be no standpoint 'outside' of ongoing scientific practices from which to articulate norms to which they are accountable. Yet they disagree that science studies must therefore simply describe (and perhaps explain) the norms that function within those practices. The normative accountability of scientific practices is not a determinate fact or regularity about them (or about scientific 'communities'), but is instead constitutive of their intelligibility to practitioners and interpreters alike.

Scientific practices only make sense in terms of what is at issue and at stake in those practices. Yet these issues and stakes are themselves contested within the practice, and its interpretation. Cultural studies are not neutral descriptions of what scientists do, but interpretive construals of those doings that may thereby partially reshape the field of subsequent practice. In that respect, cultural studies are continuous with scientific work, which likewise reinterprets what is at issue and at stake through re-enacting the practices it participates in (Rouse, 1996).

Cultural studies thereby articulate dynamic, expressive conceptions of meaning, knowledge, and power, which contrast sharply with the standard approaches to these phenomena within philosophy and social theory (Rouse, 1996, 1999). On such accounts, meaning is not a property of utterances or actions; the term 'meaning' instead articulates the ways in which such performances inferentially draw upon and transform the field of prior performances in which they are situated. Knowledge is, likewise, not a theoretically coherent kind of representation; the term 'know' is used expressively in ongoing practices of assessing, attributing, relying upon, and contesting understanding and justification. Power, in turn, is not a substantial component of social interaction, something possessed and exercised by some agents, and lacking for others. The term expresses the ways in which one action aligns with others over time to affect the field of subsequent possible activity: 'power' articulates the connections between causal efficacy and intelligibility. Cultural studies of science thus expressively articulate the semantic, epistemic, and effective roles of scientific practices.

Prominent Themes

The preceding account offers a broadly philosophical interpretation of the aims and commitments embodied in the wide range of historical, anthropological, and sociological investigations that exemplify cultural studies of science. Typically, however, these commitments are expressed through detailed studies of particular practices, performances, or institutions rather than as explicit philosophical theses. A representative list of prominent work in cultural studies of science would include work directed toward particular laboratories, field sites, and other settings (e.g., Haraway, 1989; Heath, 1997; Traweek, 1992; Biagioli, 1993), images, models, and metaphors (e.g., Bono, 1995; Haraway, 1992; Keller, 1995; Martin, 1994; Daston and Park, 1998), and machines and procedures (e.g., Barad, 1998; Galison, 1997; Rheinberger, 1997; Daston and Galison, 1992), all of which involve patterns of exchange between scientific settings and other sites of meaning-articulation. These topics have been marked as productive foci of inquiry not because they are relatively localized or self-contained, but because they have been productive nodes in the circulation and transformation of meaning, knowledge, and power around potent and often contested issues.

'The body' has been among the most prominent of these issues taken up in detailed work by cultural studies scholars, perhaps in part because of their insistence upon the embodied, materially interactive dimension of scientific practices. Attention has been directed toward bodily disciplines and skills (both as constitutive of scientific knowing, and as impositions upon who or what is to be known); toward prosthetic extension or reorganization of bodily engagement with the world (including the immunological internalization of the boundary between bodily self and external others); toward bodies as raced and gendered, and otherwise differentially marked (Heath, 1997, for example, takes up the distinctive bodily markings and significations of Marfan's Syndrome); toward animal bodies, microbial 'bodies,' and their complex material-semiotic relations with human embodiment; and toward various processes and apparatuses of bodily reproduction. Along with 'the body,' other meanings partially constitutive of scientific knowing have also become issues for cultural studies of science. Authorship and authority, objectivity in its multiple contested deployments, the construction of professional and disciplinary identities within and around the sciences, and the affective dimensions of scientific understanding (e.g., wonder, anxiety, love, empathy, and various forms of humor) have been among the epistemically significant issues that have provided a focus for cultural studies of science. Cultural studies have also been attentive to many of the ways in which the objects of scientific understanding have been meaningfully articulated. Genes, organisms, cyborgs, blood, information, life, matter, viruses, origins, secrets, foundations, environment, and ultimately nature in its significant differentiation from culture, society, artifact, and history have been prominent themes in both scientific practices and cultural studies of science.

In rejecting global legitimations or critiques of science as justified knowledge, social consensus, empirically reliable methods, cultural tradition, or approximately true theories, cultural studies of science have attempted to set aside the project of accounting for what science really (essentially) is, or how science is actually done, in favor of participatory engagement with specific scientific practices. The sciences are not regarded as optional practices (or belief-systems), of which it could even make sense to be for or against, credulous or skeptical, as a whole. Scientific practices are integral to the

formation of a field of intelligible possibilities for action and self-understanding, partially constitutive of any conceptualization of who we are and what our situation is. To engage successfully in cultural studies of science is to clarify, and thereby partially transform, that field of possibilities and our involvement within it. Ultimately, the stakes in cultural studies of science are located in the notion of responsibility. To whom, to what, and in which respects are the sciences and science and technology studies responsible? How might such responsibility be exercised, and even partially fulfilled, through scientific research in particular settings, and through cultural studies of specific scientific or technological practices? What criteria or concerns should govern the assessment of responsible and irresponsible science and science studies? With these questions in mind, cultural studies become not simply a specifiable and in-principle exhaustible domain of academic inquiry, but an ongoing project of responsible engagement within the cultures of science.

Cultural Views of Life Phases

Abstract

The knowledge base in the study of human development is built primarily from work with children from the modern, global, postindustrial population. This population is unrepresentative in many respects, not least in that childhood and adolescence is dominated by the experience of formal schooling, an experience missing from the lives of most of the world's children until very recently. This entry will examine child development from the perspective of premodern societies as described in the ethnographic, archaeological, and historic records. Specifically, we will review material indicative of cultural or indigenous models of development, phases, and phase transitions, in particular.

Introduction

Our goal is to convey the variability and commonality that exists in culturally constructed views of life phases. When examining these cases it becomes clear that societies differ in their models of development. However, nature provides predictable transitions (e.g., walking, speaking, theory of mind, puberty) upon which most societies build in constructing models of development. We describe these patterns and provide examples that best illustrate the variety and/or similarity found in culturally constructed views of life phases. An anthropological analysis of phases and transitions in children's development takes into account three data sources. First, and most obviously, we consider nomenclature that is used to mark phases or transitions. Second, we take note of particular rites or ceremonies – also known as 'rites of passage' – associated with life-phase transitions. Third, we draw on the ethnographic and historic records for evidence of changes in the behavior of children and their families that signal a shift in the child's status. We utilize these data to construct broadly applicable cultural models of child development. These models coalesce around six phases in the life cycle, which, not coincidentally, correspond to evolutionary biologists' partitioning of the lifespan (Bogin and Smith, 2012: 521 – Lifespan Development: Evolutionary Perspectives) This entry draws on a long-term project designed to develop an anthropological perspective on human development (Lancy, 2007, 2008, 2010, 2012a,b 2013; Lancy and Grove, 2011a,b; Lancy et al., 2010). Our database consists of archival accounts of childhood from nearly 1000 societies, ranging from the Paleolithic to the present and from every area of the world.

Phase Terminology

The Bonerate are representative of the majority of societies that fail to name or identify transitions in the life course. They "cannot define precisely the onset of childhood … they have difficulty describing the boundaries between childhood and adolescence and between adolescence and adulthood" (Broch, 1990:15). When we look at societies that do make such distinctions, we see great variability. At one extreme, the Busulu of E. Kalimantan name 24 distinct phases from *lemaub*, meaning 'to be able to roll over,' to *nysagawan dungai lungud*, meaning 'to carry a small bamboo water tube,' to *timpun sinigod gegalu*, meaning the first appearance of breast buds (Appell-Warren, 2012). By contrast, the Inuit of the Belcher Islands have only three named phases: (1) up to 1 year – *natarak*, (2) 12–18 months – *qitungak*, and (3) from 3 years until they become betrothed they are t*ugusi* (Balikci, 1970: 41).

The basis for named transitions also varies. For example, the Tukano of Brazil take note of physical features in designating phases. They have terms for 12 developmental transitions – birth through puberty. For example, *Soãgõákã* means 'little red one,' noting a change in skin color after birth; *Duhigö* means 'one who sits down'; *Böagö* means 'to creep'; *Sγagö* 'to walk,' and so on (Silva and Lillios, 1962). The Igbo also use terms that note physical maturation: *ino odu* (be–sit) a child who sits at around 3 or 4 months; *igbe igbe* (crawl–crawl) when the child begins to crawl at 7 or 8 months; *iguzo mpe* (stand up) when the child starts to walk; and *ifuteleze* (teething) when the child begins to sprout teeth (Ottenberg, 1989: 20).

The Baining (of New Britain Island) use mode of locomotion as the basis for phase-naming conventions. A newborn baby is carried in an adult's arms or in a sling tied across the chest. In answer to the question 'how old is he (or she)?', a child of this age is described *as ta tal ka (ki)* or 'they carry him (her).' After the age of 5 or 6 months, parents begin to carry their children on their shoulders. This form of transportation requires that the child have some sense of balance and support and take some part in maintaining his or her posture. Children of this age are described as *ka (ki) kalak* or 'he (she) sits on the shoulders.' An older child is identified by the phrase *ka (ki) tit* or 'he (she) goes' which refers to crawling and, then, walking. An older child who has become even more independent (e.g., 7–9 years) is referred to as *ka (ki) tit mas* or 'he (she) goes fully,' meaning that he or she goes for water, firewood, or to gather in the bush (Fajans, 1997: 86–87). In naming practices that focus on physical maturation and basic skills of locomotion and

speech, the first 3 years are partitioned many more times than later periods in the life cycle.

Other societies use terms that call attention to the child's accomplishments: Among the Giriama (Kenya), a two- to three-year-old is labeled, in effect, 'water carrier.' An eight-year-old girl is defined as a 'maize pounder,' a boy of the same age is *muhoho murisa* 'herd boy' (Wenger, 1989: 98). In premodern Russia 'our plowboy,' 'our herd boy,' and 'our nanny girl' were habitual terms parents used to address their children (Gorshkov, 2009: 15). Ages 16–20 years in post-Inkan Peru were collectively designated *cocapalla* or 'coca harvester' because youths of this age were expected to reap the state-owned cocoa crop (Dean, 2002: 43). The Savras (India) recognize five phases in human development and name them according to the primary chores carried out at each age (Mohammad, 1997).

Rites of Passage

Life-phase transitions may also be marked by 'rites of passage.' These celebrations denote the transition between one life phase and the next. Most rites include a *separation* from the previous life phase, a period of *transformation*, followed by a ceremony marking *integration* into the next phase (van Gennep, 1961). As with naming conventions, rites of passage center around milestones in physical maturation or mark achievements or 'firsts.' These rites are rarely tied to precise dates, such as the birthday, because preliterate societies do not keep track of birth dates or the passage of years.

Naming Ceremony

Although birth would seem an obvious candidate for a rite of passage, it is interesting to note just how few societies treat this as worthy of such a celebration. We discuss below how early infancy is characterized, but the main reason that the birth is not seen as cause for celebration is that both mother and baby are in an extremely precarious state. Once it is clear that the infant has a good grasp on life and paternity is acknowledged, the infant is introduced to the community via the naming ceremony, which can occur days, weeks, or even months after birth. During this liminal period, there is a clear sense that the infant is still in the process of becoming a human being (Lancy, 2013). This is conveyed by the timing of the naming practices. For example, in Brazil, Wari babies usually do not receive a personal name until they are about 6 weeks old. Until then, babies of both sexes are called *arawet*, which translates literally as 'still being made' (Conklin and Morgan, 1996: 672). The confirmation of personhood is delayed on Gau Island in Fiji, Melanesia until the infant is 4 days old after which a celebration called the "falling of the umbilical cord (*lutu na nona i vicovico*) occurs" (Toren, 1990: 169). In the Himalayas, the Lepcha of Sikkim, continue to refer to the newborn as a 'rat child' as if it were still inside the mother's womb. After three days and a thorough cleansing, the infant is welcomed into the community with a feast (Gorer, 1967). Among the Masai of East Africa, the first name is given on the fourth day after birth, when the child is brought outside to be shown the sun. The child is named in the presence of the father, mother, and three elders (Huntingford, 1953: 116–17). Among the Azande of north-central Africa, the midwife is not paid and the infant is not named until they are sure that it will survive. When survival seems likely, the whole community takes part in a ceremony in which the infant is removed from the birthing hut and passed through the smoke of a greenwood fire (Baxter, 1953: 72).

First Haircut

The 'first haircut' can occur with the naming ceremony, but usually happens some time after. The first haircut does not necessarily correlate with a particular age as concerns about viability are not easily set aside. Rather, the first haircut seems to commemorate the child's successful survival during a very difficult period. The rite may also be used to signal a weakening of the child's exclusive ties to its mother and the establishment of ties to its father and extended kin network (Fricke, 1994: 133). With the first haircut we also see the beginning of differentiation between the sexes. The Kurds of Rawanduz give the first haircut after the child has survived a year (Masters, 1953: 159). The equivalent Balinese rite occurs at about the same age and until the first haircut the child is not allowed to touch the ground and must be carried at all times (Geertz, 1961: 104). In northwestern Africa, the Bambara of Mali shave only part of the child's head. Some locks are kept in a container, some thrown into the river as a sacrifice, and elders examine the remaining hair to determine the child's *téré* or character (Paques and Turner, 1954: 119). The Navajo see the first haircut as a necessary step on the path to Navajo personhood, attained only after the child speaks its first words demonstrating that it has control over its thought and voice (Schwarz, 1997: 146–47).

Accomplishments

Once the child is free and clear of threats to its existence, the next major milestones are related to puberty and marriage. However, it is not uncommon to make a minor rite of passage out of the child's accomplishments or 'firsts.' These celebrations mark the child's developmental progression as a contributing member of the family. For example the Kaoka of the Solomon Islands allocate small plots of land to their sons and boast of the yams they will grow (Hogbin, 1969: 39). In central Africa a Mbuti boy bringing home his first 'real animal' is immediately proclaimed a hunter and receives scars (cicatrization) incised by one of the 'great hunters' indicating his changed status (Turnbull, 1965: 257). In North America, Hopi girls who have mastered grinding corn are 'shown off' to visitors (Hough, 1915: 63). Among the Saami of northern Europe there are no rites of passage or acknowledgment of any kind for a growing girl until she completes her first pair of reindeer shoes or some other complex needlework (Pelto, 1962). Other examples of the marking of firsts with rites of passage are a Netsilik girl's first caught salmon or a Netsilik boy's first goose (Balikci, 1970: 45); a young Kaoka boy's first pig (Hogbin, 1969: 39); a Wogeo child given his or her first garden plot (Hogbin, 1969: 139–40); the first shepherd's crook given to

a Vlach six-year-old (Campbell, 1964: 156); and the first bow and arrow provided to a Kutenai Indian boy (Grinnel, 1923: 115).

Adolescent Initiation

The timing of the most commonly employed rite of passage is dependent on the appearance of the first signs of puberty. Once the growth spurt, deepening of the voice, menses, breast buds, or pubic hair become visible, a rite of passage may follow. On the island of Vanatinai in Papua New Guinea, at approximately 14 years of age, the first signs of puberty become apparent. "For a girl that is when her breast buds are 'the size of betel nuts,' and for a boy when his voice begins to change" (Lepowsky, 1998: 128). Physiological change and emerging sexuality are often one of the foci of initiation. Among the Tamil of southern India, a girl at first menstruation must avoid 'hot' foods and mature men, for both would inflame her already heightened state of passion. The best cure for the state of heightened passion among nubile young Tamil women is "marriage and frequent sexual intercourse" (Reynolds, 1991: 40). Among the Dogon of north-central Africa, parents keep a watchful eye on the formation of their daughter's breasts and other signs of sexual maturity. They are concerned that, if the necessary puberty rite is not performed before her first menses, when she finally becomes pregnant, her first child may die (Calame-Griaule, 1986). Among the Muria of India, children are initiated (scarification on the chest and upper arms of the body) after the onset of heterosexual relations, to acknowledge this important phase in their transition into adulthood (Elwin, 1943).

Rites for girls emphasize fecundity, subservience to senior women, and obedience to one's future husband (Richards, 1956: 103); and those for boys, subservience to senior men and dominance over women (Tuzin, 1980: 26). The youth is forcibly weaned from the 'bad influence' of the peer group (Rao, 2006: 59). Didactic instruction in the 'lore' of the society is not evident. On the contrary, the initiation rite is an opportunity to impress upon young people their ignorance and powerlessness. "In Kpelle society secrecy … supports the elders' political and economic control of the youth" (Murphy, 1980: 193). Children entering puberty may need to prove to the larger community that they are ready for adulthood and so are tested. They may be sequestered, go without food, and be forced to withstand physically challenging or painful ordeals. Among the Mapuche, at first menses a girl is segregated in a corner of the *toldo*. For the next two days she is made to run long distances as fast as she can. On the third day she is told to go and gather three bundles of firewood, leaving them at three different locations. After she completes these tasks there is a celebration of the girl's newly achieved status (Cooper, 1946). In northwestern New Guinea sexual maturation or menses in Kwoma girls occurs without public recognition, but puberty in Kwoma boys must be induced by imitating menstruation. During their rite of passage, older men repeatedly scrape a boy's penis to induce bleeding. The boys are encouraged to continually bleed themselves after their rite of passage is complete, to ensure proper growth and to keep themselves fit (Williamson, 1983).

Puberty rites may commence at the first signs of puberty or later, and they may be quite short in duration or last several years. Hence the completion of the rites may not automatically confer adult status. There may be further, subtler tests of an adolescent's preparedness for marriage and formation of family. Gusii parents may withhold approval and resources from the aspirant bride, demanding "evidence of *okongainia* … which means … being willing and able to do the work of an adult woman … and perform these duties without having to be ordered" (LeVine and Lloyd, 1966: 167). As we will discuss shortly, there are multiple, cross-cultural pathways, to full adult status. Consequently, marriage is often treated as only a very minor rite of passage.

Life Phases

Our survey of ethnographic literature shows that one cannot rely on semantically or ritually marked transitions in the life course as guides to the cultural construction of child development. This is because phases are rarely specified in full by formal means; rather, one must construct them from descriptions of the child's behavior and the behavior of others toward the child (Mead, 1947: 234). For example, in an earlier and widely cited survey, the authors identified a widespread but unnamed phenomenon they referred to as 'toddler rejection' (Weisner and Gallimore, 1977: 177), which defines conceptually how many societies view the postweaning period. Anthropologists consistently note a significant shift in the status and treatment of the child between 2 and 3 years but this phase is rarely labeled as such.

Phase One: Birth and the External Womb

As noted earlier, the child's birth may be shrouded in secrecy. Pregnancy itself is rarely acknowledged publicly because there are many factors that might adversely affect the outcome. A 'wait and see' attitude is adopted, as the mother may not be physically able to carry the pregnancy to full term due to poor health or she may choose to terminate it due to lack of support from family or the community. This 'wait and see' attitude is carried into the birthing process and postpartum seclusion provides a curtain of secrecy and security behind which the fate of the infant is decided. After birth, an infant may be seen as still intimately linked with its mother for survival and in mortal danger. "[The Somali] conception is that the newborn child for a certain time after birth is still … part of the flesh and blood of the mother" (Cerulli, 1959: 25). "[Wari] mother and infant are treated as a unit; for about six weeks after birth they remain secluded together inside their house … babies of both sexes are called *arawet*, which translates literally as 'still being made'" (Conklin and Morgan, 1996: 672). The newborn is not fully human: it's bones are soft (Helander, 1988: 150); it is pale and lacks the proper human color (Childs, 1949: 120); it has no mind or thoughts other than the breast (Shostak, 1981: 113); it can't speak and is as yet, empty (Du Bois et al., 1944: 76). And these folk beliefs are consistent with most theories of

human ontogeny that suggest the infant is 'born three months too early' (Bogin and Smith, 2012).

The postpartum womb is a key component of the way the infant is conceptualized and cared for. So tight is the bond, that the Japanese infant is looked upon as part of the mother's body (Lebra, 1994: 260). The use of swaddling and severely confining cradles or cradleboards is widespread. In the high Andes, babies are almost constantly confined to a 'manta pouch,' which functions to reduce the baby's metabolism and need for energy (Tronick et al., 1994: 1009–1010). Nurzay women explained that "the newborn baby's flesh is *oma* (unripe) like uncooked meat, and that only by swaddling will it become strong (*chakahosi*) and solid like cooked (*pokh*) meat" (Casimir, 2010: 16). Navajo babies are kept "in the cradleboard to make them straight and strong. Some women let their children lie on sheepskins and roll about, but they are always weak, sick children" (Leighton and Kluckhohn, 1948: 23).

Even more common is the practice of attaching the baby to its mother via a length of cloth or a sling. The nursing mother shifts the baby quickly to the breast at the first sign of movement (Broch, 1990: 31). The infant remains within a cloth envelope throughout and the nursing process passes completely unnoted by others. A baby should be invisible (Lancy and Grove, 2011a: 283) to protect it from many threats, including witchcraft and the supernatural. Even the father may be seen as dangerous (Gray, 1994: 67) and the postpartum taboo prohibiting contact between the nursing mother and her husband is widespread (Lloyd, 1970: 81).

Another component of this phase is the widely distributed notion that the infant is in a liminal state suspended between the human and spirit worlds (Razy, 2007). There is the idea that the soul and body are only loosely connected and that, if the infant is not closely confined, its soul will escape back to the world of spirits and ancestors (Arden, 2011; Leavitt, 1998). Care must be taken to prevent the infant from moving its limbs vigorously or becoming agitated (Nicolaisen, 1998; Lancy, 2013).

Phase Two: Joining the Community

As we have indicated in Phase One, the infant does not exist as a distinct entity. The likelihood of death or infanticide are so great that the infant's passing goes unmarked and there will be no formal funeral, burial, or mourning (Becker, 2007: 282). In effect, gestation continues beyond birth. The infant must exit from this metaphorical womb and enjoy a second birth. This second or social birth (Fabian, 1990) may be marked by a rite of passage such as naming or the first haircut or nail-trimming (Masters, 1953), as discussed earlier. An important element in the construction of personhood is the child's acquisition of kin and linkages to the father, his clan, and extended family (Blanchy, 2007). "Many Hubeer … postnatal practices [involve the] shedding of the symbols for maternal ties [and establishment of] agnatic links" (Helander, 1988: 150). The transition from crawling (which is animal-like) to walking (human) may be highlighted. The child is now acknowledged as human or at least as potentially human.

Another very important attribute of the baby's 'coming out' is a very sharp spike in the involvement of allomothers. Humans are cooperative breeders and, within a few months of birth, the baby is increasingly under the care of grandmothers, older siblings, and fathers (Hurdy, 2005: 65–91), so that mothers can return to their labors full-time. Mothers may be so eager to attract the assistance of allomothers that they market their babies in interesting ways to neighbors and kin (Ochs and Schieffelin, 1984: 279; Gottlieb, 2004). A thriving infant will attract the caring attention of many, as well as threats from those who might be envious of the fertile mother, so steps must be taken to protect the now very public baby from malevolence (Einarsdóttir, 2006: 116–17; Friedl, 1997: 88; Jenkins et al., 1985: 43). The nursling enjoys a kind of honeymoon of affection and care from all sides but as weaning approaches, a change is evident.

Phase Three: Separation

This phase corresponds to our western notion of 'early childhood' (Historical Change and Human Development). As noted earlier, a prominent feature of this phase is 'toddler rejection' (Weisner and Gallimore, 1977: 176). Weaning, sometimes early – long before the child might wean itself – and severe, is widely reported. "A [Luo] woman who is pregnant is supposed to stop breast-feeding, since it is believed that the milk will be poisonous to the nursing baby and will cause it to get the illness *ledho*" (Cosminsky, 1985: 38). Numerous ethnographic accounts show mothers imposing early and abrupt termination of breast-feeding. Extended nursing may be condemned as prolonging the infancy phase, resulting in a 'weak, simpering' adult (Turner, 1987: 107). The mother is also eager to wean the child from her back, which may be just as tearfully resisted as weaning from the breast (Maretzki et al., 1963: 447). The Yoruba are quite typical in averring that "mothers and grandmothers [prefer] wiry and agile babies who learn to walk early" (Zeitlin, 1996: 412). The Nso of the Cameroons believe that: "A standing baby … makes less work for the mother" (Keller, 2007: 124).

Aside from the attentions of allomothers (often a grandmother at this phase), separation from the mother is aided by the child's powerful attraction to the neighborhood playgroup. "With the arrival of the next sibling, *dénanola* (infancy) is over. Now, play begins … and membership in a social group of [Mandinka] peers is taken to be critical to … the forgetting of the breast" (Whittemore, 1989: 92). The locus of the playgroup may be in a space that the Kpelle label the 'mother ground' as it lies in the vicinity of at least a few working but attentive adults (Lancy, 1996: 85). Aside from freeing up the mother for other pursuits, sending toddlers off in the company of sibling caretakers and playmates is seen as an essential component of their socialization. For example, in rural Bengal "Little girls accompany older girls in gathering, and they gradually learn the needed skills" (Rohner and Chaki-Sircar, 1988: 33). Marquesan mothers see toddlers as developing skills because they *want* to hang out with and emulate their older siblings. By imitating their sibling caretakers "toddlers learn to run, feed, and dress

themselves, go outside to urinate and defecate, and help with household chores" (Martini and Kirkpatrick, 1992: 124).

Once the child has accepted its separation from the mother's breast and back, it is readmitted into the family circle, so to speak. The behaviors and conversations of those older constitute a kind of classroom where the child rapidly learns its culture. Matsigenka "infants and young children are embedded in the middle of quotidian activities where they are positioned to quietly observe and learn what others are doing" (Ochs and Izquierdo, 2009: 395)." "At the age of three he chooses his own place at the [Wolof] family meal and here he is encouraged to acquire social norms" (Zempleni-Rabain, 1973: 222).

In addition to learning social graces, this period constitutes the child's induction into the family economy (Lancy, 2012a). Margaret Mead offered one of the earliest descriptions of a phenomenon often recorded since. (On Samoa), "the tiniest little staggerer has tasks to perform – to carry water, to borrow fire brands, to fetch leaves to stuff the pig …. learning to run errands tactfully is one of the first lessons of childhood" (Mead, 1928: 633). Often the child is overeager to emulate those older and they will be reined in. In Botswana, toddlers may be prevented from handling grain for fear they will let it spill on the ground (Bock and Johnson, 2004). Bamana children are prevented from messing up planted rows in the garden (Polak, 2003: 126) and little Inuit boys are kept some distance from the prey during a hunt, so that they would not scare it off (Matthiasson, 1979: 74). Around 5–7 years, a shift in expectations occurs. Tolerance for the child's helpful but clumsy and inconsistent contributions wanes.

Phase Four: Getting Noticed

Around 5 years, children become 'useful.' They are expected to contribute to the household, by helping with chores, taking care of siblings, and acting as examples (Broch, 1990: 28). Although children may participate in household chores from an early age, they may not be trusted with more serious responsibilities until they 'gain sense' (Harkness and Super, 1986). The child's *lack of* sense is also cited to excuse them from misdemeanors that would be chastised in an older child (Maretzki et al., 1963: 481; Read, 1960: 89). Pashtun girls in middle childhood are sent by their mothers to discreetly scout out and give voluminous reports on the latest events in the village or on a recent scandal (Lindholm, 1982: 181). The workload and responsibility grows with the child's size, strength, and competency. Javanese and Nepalese children work about 4 h a day as six- to eight-year-olds; this rises to 10 h or more by age 15 years (Nag et al., 1978). By age 12 years, Aka and Hadza children are already self-supporting in terms of foraging ability (Hewlett and Cavalli-Sforza, 1986: 930; Hill and Hurtado, 1996: 223). Twelve-year-old Bakgalagadi girls can run an entire household (Lancaster, 1984: 86).

Gender differentiation becomes much more pronounced in middle childhood (Lancy and Grove, 2011a). Girls become more closely associated with the domestic sphere. Conversely, boys may actually gain more freedom from the home and their mother's control (Pope-Edwards, 2005: 87), especially if they are relocated to an all-male domicile (Morton, 1996: 112). There are limits placed on interaction with the opposite sex and clothing reflects heightened modesty requirements (Lawton, 2007: 46). At this age, Berber boys will have "only limited contact with their mothers and are given a pair of undergarments (*serwal*) to wear under the *jelloba* and also a skullcap" (Hatt, 1974: 139). The Dusun call boys, 'without loincloth' and girls 'without a skirt' until they are about 5 years old, when they are then called 'child man' or 'virgin' and given appropriate clothing to wear (Williams, 1969: 86). A gap opens between the relative workloads of girls and boys and relative freedom to roam (Nag et al., 1978). Girls are expected to help with the care of siblings and the daily routine work of their mothers (Nerlove et al., 1974: 275). But in an Iranian village, boys are 'turned out in the morning like cows,' coming home for nourishment and sleep (Friedl, 1997: 148; Watson-Franke, 1976: 194).

Phase Five: Youth in Limbo

No phase in the life cycle is variable, cross-culturally, as adolescence. In the most thorough review of the literature, Schlegel and Barry assert that adolescence is discernible in all societies (1991: 18). However, puberty and the onset of adolescence may be evident as young as 12 years in well-nourished populations and as late as 17 years, in societies where nutrition is poor (Eveleth and Tanner, 1990: 170). Marriage, child-bearing, and the establishment of an independent household mark the end of adolescence. In Kau Sai, a traditional Chinese fishing village, marriage and household formation begin at 16 years, immediately following the first menses (Ward, 1970: 115); while Masaai males are not permitted to marry before 30 years (Spencer, 1970: 137). In the first case, development into adulthood proceeds seamlessly as children reliably acquire the skills appropriate to adults of the same gender and are fully competent at an early age. In the second, a rigid hierarchy among males diverts pubertal males from sex to warrior status – a role they can only fulfill by avoiding women and living at the outer perimeter of the group's territory. Pubescent girls join the polygynous households of much older, senior men as junior wives.

For most societies, adolescence, especially if it lasts longer than a year or two, is somewhat problematic. First there is the challenge of adolescent sexuality. Young people are typically interested in sex well before society thinks they are capable of managing a family. We discussed earlier the initiation rite as a means to enforce emotional maturity and deference to one's elders. Other tactics include seclusion. The Khmer seclude daughters after first menses in a state referred to as *coul plup*, or 'entering the shade.' The period varies but a longer period of seclusion provokes a more generous bride price (Smith-Hefner, 1993: 145–146). While the primary purpose of seclusion seems to be to preserve the girl's virtue to insure a successful marriage, a secondary purpose may be to shape the girl's outlook to more closely match that of the older women. A high-ranking Tlingit girl spends 2 years in seclusion during which she is informed of her clan's history and provided with homilies and more forceful reminders

to maintain behavior consonant with her rank, such as avoiding gossip (Markstrom, 2008: 145). Following seclusion, the Tlingit girl is considered marriageable and "prudent … parents took pains to marry her off promptly" (De Laguna, 1965: 21). Even in the absence of seclusion or initiation, pubertal girls are sheltered by the distaff side of the household. Their association with, and close ties to the mother begin quite early as they assist with their younger siblings and with work in the house and garden, with livestock, and craft production. So while adolescent males enjoy a wider compass for their activities, adolescent girls rarely leave their mothers' orbit.

The process for boys – parallel to girls' seclusion – is removal to a dormitory or men's house. An Igbo boy moves out of his natal home to an all-male compound (Ottenberg, 1989: 118). This men's sanctuary is the *haus tambaran* in the Sepik River area of Papua New Guinea (Tuzin, 1980). *Tapirapé* adolescent boys are moved into the *takana* or men's house where their proximity to men affords them the opportunity to observe and replicate typically male behaviors (Wagley, 1977: 149). Boys are sequestered to erase the taint of femininity acquired during years of association (primarily) with women while becoming imprinted with the male ethos. Around the world societies that devote attention to masculinizing youth are often quite warlike, and male adolescence may be synonymous with warriorhood. Creating a cohort of new warriors is not the only means societies have of taming the adolescent male 'gang.' They can be conscripted to serve in work details that benefit the village as a whole. Temne living in the young men's house "*kabankalo* served as a cooperative work group for the chief, their fathers, and other big men of the chiefdom" (Dorjahn, 1982: 41). Not so subtly, they will be reminded of their subservient status vis-à-vis the village elite.

Aside from physical and social maturity and the acquisition of critical survival skills, the portal from adolescence to adulthood is usually opened only when the requisite property is available. This may include payment of a bride price or dowry, the construction of a home for the new couple, the provision of critical resources, such as tools or livestock. When the traditional pathways to adulthood break down through the abandonment of these traditional practices and customs or their suppression by church or government authorities, adolescents can't become social adults (Biersack, 1998). Instead, they become 'insurgents' (Honwana, 2006; Rosen, 2005) or village *bikhets* (Leavitt, 1998).

Phase Six: Adulthood

The most important thing to understand about adulthood is that, outside the contemporary bourgeoisie, societies are organized as gerontocracies (Lancy, 1996: 13, 2008: 11). One's status is governed by age and fertility. Marriage per se may carry little weight and children aged 10 years may already be capable of the full range of adult subsistence tasks (Lancy, 2012a); hence, it may take many years after marriage to become accepted as an adult. The Javanese marry their daughters as early as 9 or 10 years to stave off any hint of premarital sex and illegitimacy. A girl becomes a woman under the guidance of her mother-in-law (Geertz, 1961: 56). A Bagisu bride is given a 'woman's skirt,' but she can't wear it until the birth of her first child (La Fontaine, 1986). In Sumatra, a married Malay woman is dependent on her father, much like her unmarried sisters, until she gives birth to her first child (Swift, 1965: 124). The same criterion is often applied to young males (Leavitt, 1998: 186). For the Sambia, adulthood status is denied to the young couple until they have successfully conceived and birthed at least two children (Herdt, 2001: 164). Progeny are so important to the Akan that a man without children may be called a 'wax penis' and upon death, childless adults may have thorns driven into the soles of their feet (Warren, 1986: 11). A Chukchee man will take an additional wife if his first wife does not give him children; his first wife, if she is a 'good' wife will gladly encourage him to do so (Bogoraz-Tan, 1924: 600).

Conclusion

Cultural models of human development (Strauss, 1992) vary cross-culturally but shared patterns can be detected in the ethnographic record. Clues to discerning such patterns can be sought in milestones of biological development, such as first menses and in indigenous nomenclature and rites of passage. One must also examine child care, dress, patterns of residence, selection of caretakers, assignment of chores, and other culturally sanctioned practices that change reliably over the life cycle. These broadly applicable cultural models coalesce into six life phases in the life cycle. Phase I includes the birth of the infant and early infancy. Unacknowledged by society, the newborn is still seen as part of the mother and therefore still in the process of being made. Its survival not guaranteed, the infant is kept tucked away in some form of an external womb, until its survival is sure. Phase II occurs when it is clear that the infant will survive. The infant is introduced to the community, usually through a rite of passage that may include a first haircut and/or a naming ceremony. Alloparents join the mother in caring for the child. Phase III removes the child from the mother's breast and provides a push toward independence with weaning, walking, and toilet training. Toddler rejection, as this is often called, is mitigated by the lure of the playgroup. In Phase IV children become useful. Younger children are expected to do chores and, as they gain common sense, are entrusted with ever more difficult tasks. Gender differentiation is expressed as girls become tied to the domestic sphere and boys are allowed more freedom from the domestic sphere. Phase V or adolescence is highly variable and elastic across and within cultures. Passage into or out of this phase may be marked by an initiation rite. In some cases, adolescence is short, as youth begins cohabitation leading eventually to family formation. Lengthening this phase often creates a social problem with youth aggregating into gangs and behaving antisocially and we discussed a suite of culturally constructed responses. Phase VI commences with marriage, but marriage is not the key to adulthood – the entry to adulthood is rather the successful siring/bearing and raising of children.

Outlook

The ethnographic record – with well over 1000 discrete reports of childhood from hundreds of societies – has proven a rich source of ideas for reconsidering child development. We have drawn on such sources in constructing this brief overview of life phases. However, we can identify a number of additional issues and questions that might be pursued. For example, in the ethnographic record, infant and child mortality is very high. This tragedy has been largely eliminated in postindustrial society. On the other hand, children in economically developed societies suffer from emotional stress, depression, and disorders like ADHD – all completely unknown in indigenous societies. Are genotypes now preserved that would not have survived prior to the development of modern neonatal medical care? Here is another paradox. Children in small-scale societies are eagerly involved in daily routines and eagerly help out with chores. This contribution to family life continues throughout childhood. Such predilections have almost completely disappeared in contemporary bourgeoisie society and parents lament their children's selfish, self-centered attitudes. Could there be a critical period at 18 months to 2 years where the child's prosocial attempts are rebuffed (because letting them help makes extra work or is too dangerous), thus extinguishing the motivation? Or are contemporary parents so concerned about raising unique individuals that they give little thought to prosociality, whereas traditional economies are dependent on and seek to foster cooperative, sociocentric children? In the ethnographic record, we see that children are rarely pushed to learn or develop; they progress at their own pace. Recognition of achievement or celebrating a child's birthdays and other milestones are rare to nonexistent. Praise and gifts are offered rarely. In contrast, we track age and many other milestones, carefully calibrating progress against a 'standard.' In contemporary societies a child can be identified as failing or 'developmentally challenged' almost from birth. At the same time, we lavish praise on our children, all of whom are 'special.' So, for 1 min they are perfect, the next, flawed. Could this be the source for the epidemic of emotional disorders? In indigenous societies adolescence varies in length, but in most societies children have mastered the full suite of adult subsistence skills and are self-sufficient not long after puberty. In contemporary society, preparations to become employed and self-sufficient and then get established in a career may prolong the adolescent phase for a decade or more. Are there social consequences of this drastic increase in the period of juvenility? Until quite recently, formal education affected a tiny minority. In traditional societies children are primarily social learners and parents rarely see the need to teach. Children learn largely through observation, imitation, and practice. It is our impression that we are witnessing the rapid spread of a form of learned helplessness. Youth in bourgeoisie society seem unable to learn without guidance from a teacher. The belief that children's activities require the careful guidance of an adult extends to play, an activity formerly the exclusive domain of children. Are we undermining our children's very powerful abilities (the basis of human culture) to learn socially? Analysis of the ethnographic record provides numerous examples of the incongruity between how indigenous and bourgeoisie societies view and structure childhood. This contrast sheds light on the lives of all the world's children, enriching conversations about the course of development.

Culturally Appropriate Interventions in Social Work

Abstract

The aim of this article is to define the ideas underpinning culturally appropriate interventions and to introduce related concepts which have contributed to developments in countries such as the United Kingdom. Words such as culture, ethnicity, race, racism, and race relations have played an important role in the development of culturally aware social work practice and will, therefore, be explored for relevance and usefulness.

Introduction

Social work competence (i.e., the incremental development of skills over time) requires understanding the impact of relevant, and sometimes opposing, theoretical developments derived from across the world. Professional interventions may be defined as context-dependent expert interactions used to meet the specific social, health, or psychological needs of individuals, groups, and communities. The aim is to maximize understanding, minimize risk, and take full account of behavior and emotion (Walker, 2002). Cultural competence should be based on advanced knowledge of factors (such as class, race, sex, and income) that intersect to advantage or disadvantage service users (Law, 2010). To be meaningful, professional input should be supported by culturally appropriate training and procedures designed to respond to individuals and groups in relation to their languages, traditions, and customs.

Professionals who intervene in a culturally appropriate manner respond to the welfare needs of individuals and groups from ethnic minority backgrounds seeking help from public, private, and independent sector organizations (Lum, 1997). The methods of intervention may vary according to country and context, but the need to be culturally aware remains dynamic and current, particularly in places with a large and complex population mix. Many countries have developed statutory instruments, which allow individual challenges against discriminatory actions and behaviors. Societies like these are more likely to acknowledge racism as a social construct and have people living together in multiracial communities that demonstrate a clear commitment to improving relations and sharing cultural, religious, and other practices (Aveling, 2007; Walker, 2002).

Social workers are required to use practice methods that are appropriate to the culture and ethnicity of the service user and are in line with the relevant legal and policy requirements (Fook, 2006), which define difference and diversity on the grounds of color, ethnicity, and religion. However, evidence on sensitive practice with indigenous groups has pointed to the shortfall on, for example, the use of aboriginal knowledge, such as the impact of colonization over generations, within aboriginal service developments (Augoustinos and Reynolds, 2001). Critics suggest that approaches, which take little account of how history can influence contemporary experience, are likely to lead to little real change (Taylor et al., 2010).

A great deal of national law and policy is based on the universal conventions on human rights, ethics, and values. Such ideas are used to develop professional practice through organizations such as the International Federation of Social Workers, European Federation of Social Workers, International Association of Schools of Social Work, and national organizations such as the British Association of Social Workers in the United Kingdom. Although standard setting is important in social work (Gray et al., 2008), using global yardsticks to interpret individual cultural interventions can be contextually problematic, that is, it may lead to a professional focus on appropriate behavior rather than on the more politicized, institutional effects of race and racism (Dominelli and Thomas Bernard, 2003; Walker, 2002).

Historical Backdrop

Culturally sensitive services gained prominence in the 1990s alongside the greater professionalization of social work and the move to link discipline-related knowledge to practice outcomes (Fook, 2006; Augoustinos and Reynolds, 2001). During this time, strategies such as the recruitment of same-race social workers and the cultural matching of service users and professional interventions were adopted in countries such as Australia and the United Kingdom. However, critics suggested that tactics such as these sought individual rather than social change and led to the marginalization of particular groups (Patni, 2006). Although some immediate and urgent service needs were met through these methods, the majority remained powerless and outside mainstream services. This was to be addressed through institutional and structural change as a prerequisite to service delivery based on principles of equality and social justice (Sivanandan, 1991; Gilroy, 1995; Ali and Barsamian, 2005; Brah, 1996; Solomos and Back, 1995). However, critical and political approaches to antiracist practice resulted in a major review and change of direction for social work education in countries such as the United Kingdom in the early 2000s (Dominelli, 2002).

Culture describes a system of meaning and custom (Cashmore, 1996) and multicultural implies recognition and approval of groups based on difference and diversity. During the 1990s, simplified notions of culture were often related to the assimilation of newly arrived immigrant groups (Sakamoto, 2007), indigenous peoples (Taylor et al., 2010), and established minorities (Jackson et al., 2010). Within the

context of settlement, nation-states implemented assimilation and integration policies using questionable intervention techniques to persuade newcomers and minorities to fit into majority social norms (Lentin, 2000). This approach led to poor outcomes for the social service users in particular, and for society in general, because it did not always lead to structural change or enhance the customs and traditions of the groups in question (Sakamoto, 2007).

Increasing awareness of assimilation by policy-makers (Ely and Denney, 1987), as a method of dominance, has led to greater attention being paid to other approaches, such as integration, which have gained some support as a middle ground alternative for communities living and contributing to society together, while maintaining their own customs and traditions. However, integration requires consideration of fair and useful service outcomes delivered through systems and structures that allow user-led identification of need and intervention methods. The relationship between ideas such as integration and the delivery and outcome of public sector services has received little attention in social work research and literature particularly in areas such as children's mental health (Walker, 2002).

Attention has, however, also been paid to legal drivers that define key terms (i.e., direct and indirect discrimination) and set out individual and organizational duties and responsibilities. Over time, provisions such as these have played a part in sustaining the enduring legal and policy link between minority groups and culture, religion, and skin color. For example, the 1976 Race Relations Act and the 2000 Race Relations Amendment Act in the United Kingdom define unfair or less favorable treatment of individuals and groups on the grounds of color, race, nationality (including citizenship), ethnic or national origins, and religion.

Although malleable and ambiguous, the terms race, racism, and race relations carry equal weight as legal and social constructs in many countries (LeCouteur and Augoustinos, 2001). In Britain, these have been interpreted to develop antiracist social work practice and fine-tune culturally appropriate services. However, proponents of antiracist practice (Dominelli, 1997; Lentin, 2000; Patni, 2006) believe that racism remains at the heart of the problem and therefore view the focus on cultural perspectives as lightweight and superficial.

Race, Racism, and Culture

Race has a range of meanings derived from history and science, complicated by the division of the human *race* into the subspecies of Negroid, Mongoloid, and Caucasoid (Cashmore, 1996). Within social science literature, however, the term has changed its meaning over time from biological to social and cultural:

> Historically, the meaning of the term 'race' has varied. It once focused on a racialised hierarchy that encompassed the physical attributes of all races – identified by skin colour and depicted in popular parlance as white, yellow, red and black (Gobineau, 1953). Definitions of race propagated by Count Gobineau illustrate a biological theory on racialised skin colour. Later, it focussed on allegedly different intelligence levels that favoured the 'white' race.
> (Hernstein and Murray, 1994; Dominelli, 2008: p. 8)

The contemporary social definition of *race* is commonly used to group people who share common origin or descent, usually originating from different countries. Ideas around the subordination of groups based on the biological definition of *race* have been enshrined in law and social policy in many countries of the world (Ben-Eliezer, 2004), with similar discriminatory consequences for individuals everywhere on an everyday basis (Paradies, 2005).

The notion of *race* is questionable at many levels (Dominelli, 2008). British law and policy illustrates its use to imply cultural and ethnic difference based on physical attributes such as skin color, dress, and linguistic skills. Organizations tend to use these definitions to develop poor procedures and processes that are in turn used by misguided social workers in the daily professional duties. Organizational assumptions and interpretations need to be considered alongside those provided by global and national bodies and checked against evidence-based practice. Service interventions can then better relate to particular circumstances and matched to individual and group capacity, strengths, and resilience (Walker, 2002).

The word racism generates a great deal of feeling and can be defined in many ways. It is an ideology or set of beliefs and its development may be explained by oppressive hostility between two sets of groups, nations, or power blocs. For example, the slave trade was based on the notion that African people were racially inferior and thus open to justifiable exploitation. Cashmore (1996: p. 308) suggests that racism needs to be defined variously depending on context and situation: 'Racism takes different empirical forms in different societies at different points in time.'

The term racial discrimination is used interchangeably with racism in European and international conventions (Bhatti-Sinclair, 2011), but the interchangeable use of racism, racial discrimination, and racial disadvantage does not always address discrimination as the practical criminal result of racist ideology. If acted out to the extreme, racism and discrimination may harm those at the receiving end of racial violence. Confusing violent attack with disadvantage on the grounds of difference and diversity more generally suggests that extreme and moderate outcomes may be the same.

Race relations as a concept has been used widely since the 1960s within law and policy across the world to promote greater understanding and cohesion between minority and majority communities, based on the premise that equal value should be given to all groups. Legal provisions are made and delivered variably across countries and regions, and lack consistency in relation to culturally appropriate welfare services. This is illustrated by the response to the changes in migration patterns within the European Union where large numbers of people are moving between member countries to seek work and education. Nation-states such as the United Kingdom are desperate to stem this flow. To address this, the Government is openly manipulating immigration figures and seeking greater surveillance of students and patients in institutions like the universities and National Health Service (Hutton, 2013). The movement of largely white individuals looking for opportunities across Europe has challenged established ideas of racism defined by color, culture, and religion. Societal fears based on age-old ideas, such as the dilution of indigenous traditions and economic opportunities lost to eager

newcomers, remain close to the surface. Conversely, the real impact of such thinking in the United Kingdom has resulted in the under-recruitment of overseas students to universities and seasonal workers to agricultural industries. Individuals are exercising choice and moving to countries with better entry and education/work permit requirements (Hutton, 2013; Doward, 2013).

Changes in understanding and awareness have led to a greater focus on the more abstract social constructs of culture and racism, or even the combined notion of *culturalist racism* (Lentin, 2000: p. 5). Ideas of biological difference continue to have some meaning, for example, groups being seen to begin from the same reference point and relate to each other purely on the basis of racial difference. Racial difference retains a concrete existence.

The reformulation of terminology has added to the range of words used to describe culturally sensitive practice. Appropriate interventions are recognized as country and context specific and better related to history and geography (Fook, 2006). Evidence from Europe suggests that addressing individual cultural difference is more palatable to the national psyche in countries that are more homogeneous (e.g., Norway). Countries with bigger numbers and a multifaceted population mix (like the United Kingdom) are more likely to define culture in relation to particular groups and target interventions appropriately (Kriz and Skivenes, 2010).

Those who support critical race theory (CRT) suggest that antiracist practice and culturally appropriate responses have failed to provide professionals with the tools to fully engage with oppressive societal structures rooted in past history (Gillborn, 2006). CRT examines the comprehensive power ingrained in structures and systems which were highlighted as institutional racism earlier by writers like Dominelli (1988) and subsequently by the 1999 MacPherson Report on the murder of 18-year-old Stephen Lawrence in the United Kingdom. Although Stephen Lawrence died in 1993, allegations that the police sought to collect evidence through bugged meetings, held by the Lawrence family and friends after his death, continue to be made in 2013 (Syal, 2013). This supports the view that bias and partiality can be used by organizations to exploit minority groups and destabilize race relations.

Discrimination impacts directly on the way some people are perceived, categorized, and responded to within welfare services. For example, groups such as Asians and Hispanics are seen to have above average 'acculturation stressors' (Crunkilton et al., 2005: p. 115) based on strong family bonds (Ceballos and Bratton, 2010) that are likely to result in confused identities and intergenerational conflict.

For culturally sensitive interventions to be meaningful, they must be designed to demonstrate the culturally specific nature of the intervention, the theoretical constructs pertinent to the service user experience, and the specialized professional knowledge required to meet individual or group needs (Jackson et al., 2010). In particular, the link between *race*, migration, and difference needs to be disrupted even when some groups choose social separation based on culture and religion. For example, the majority of established immigrants have a long-term interest in their new country of choice but may still live in exclusive groups where distinctive cultural and religious identities can be located, sustained, and defined (Furness and Gilligan, 2010). Clustering in religious and cultural groups is common among minority and majority groups across the globe. It may occur to protect oneself against external threats such as racism and persecution and/or it may be a means by which families and groups reinforce internal practices.

The Professional Application of Cultural Appropriateness

Social work values have encompassed universal principles and legal duties across the world and nation-states are increasingly required to address social justice by signing treaties such as the International Convention on the Elimination of All Forms of Racial Discrimination, which has been ratified by 168 countries. The Universal Declaration of Human Rights (UDHR), which has also been enshrined in national legislation, provides moral guidance to professional social workers across the world (Banks, 1995).

Several provisions of the UDHR have been incorporated into British law, which has impacted on professional practice. These include the social work Code of Ethics (BASW, 2009), the Professional Capabilities Framework (Social Work Reform Board, 2010), and the Social Work Standards of Proficiency (HCPC, 2012). Social workers registered with professional bodies are signed up to follow both laws and universal principles and are committed to policies that promote difference and diversity (Banks, 2012). However, professional codes of ethics and practice have been criticized for being generalist and universal by nature and too often lacking detailed and specific follow-up guidance on equality procedures, processes, and tasks. The development of cultural competence within these frameworks has been seen as incoherent and disjointed. This has been illustrated by the dilemmas around race-specific vs culturally competent social work practice as highlighted by Patni (2006).

Although rooted in social justice and human rights principles, culturally appropriate interventions have also been used to control and manage some groups. For example, the approach has been used to assimilate newly arrived or established immigrants (Lentin, 2000) and to promote policy and practice based on notions of tolerance (Bhatti-Sinclair, 2011). The emphasis here has been on tolerating newcomers, offering them limited access to an expensive and time-consuming citizenship processes and, if successful, demanding that they take on full civic responsibilities within society.

The theoretical content and specialist knowledge used to intervene in a culturally appropriate manner have been viewed, questioned, and interpreted by social work and social policy scholars across the world for many decades (Augoustinos and Reynolds, 2001; Jackson et al., 2010). For example, cultural racism has been evaluated in the divisive context of contemporary Israel (Ben-Eliezer, 2004).

At the same time, projects which promote pluralistic difference through culturally sensitive responses to particular groups, for example, Latino families and African-American youth (Jackson et al., 2010), have taken place. Initiatives, such as parenting interventions within educational contexts, have played an important role in improving the life chances of school children (Ceballos and Bratton, 2010).

However, the emphasis on family and community has to be considered alongside structural and institutional change as well as meeting fundamental needs, such as income and housing. The assessment of need may require additional consideration of factors such as the impact of immigration on individuals and groups. It is likely that the social worker will need to assess the capacity and resilience of the service user to new experiences and ideas because some people may better retain cultural identities rooted in the past while accepting and adapting to new influences (Sakamoto, 2007). It is the responsibility of the professional to ensure that the behavioral commitment made by the individual to learn and develop is supported by service outcomes that lead to improved life chances, including better employment and education. In an exploration of acculturation relating to immigrant groups, Sakamoto (2007) suggests that service providers are motivated by different goals but that social workers, particularly those committed to antioppressive methods, are likely to understand that social action should lead to structural change. However, they may need guidance on relevant underpinning theory and knowledge framed within specified service objectives.

Culturally Appropriate Interventions

Depending on the context and the service user group, the quality and appropriateness of culturally sensitive intervention can vary. For example, therapeutic responses to substance misuse may follow particular models that are different from traditional therapeutic approaches. Cultural appropriateness requires the use of complex models on alliance building, assessment, collaboration, and sustainability of change (Gallardo and Curry, 2009). Interpretation of culture is likely to be comprehensive and includes wider factors related to immigration and generational influences within the immediate and wider family across countries and continents. Professionals using such methods are more likely to take account of individual and group values, attitudes and behaviors in intervention, monitoring, and evaluation processes (Jackson et al., 2010). Although developments have taken place across the world, the United Kingdom is used to exemplify the complexities of social work practice.

Cultural sensitivity appears to be practiced in various ways, but the most effective approaches are staged to allow time for knowledge-based bonding, cohesion, and sound communication among people (Ceballos and Bratton, 2010; Chand, 2005). This is particularly so in work with vulnerable groups, such as children, who depend on skillful professionals who are able to observe, understand, and influence cultural interactions based on a range of needs rather than a particular difference. Chand (2005) explored the results of the child protection inquiry into the case of Victoria Climbie, an 8-year-old girl from the Ivory Coast living in London (Laming, 2003) whose main carer, when quizzed through a French interpreter, offered particularly poor explanations of childcare responsibilities to social services and the police. Although the professionals had evidence that the carer spoke and understood English, they did not use this knowledge to question, investigate, and act further. Instead of communicating directly with Victoria, they allowed the carer to manipulate and take control of the situation.

The demographic profile of the areas where Victoria lived in London is multicultural. However, the many professionals involved demonstrated little sensitivity or procedural rigor in communication with each other or the carer. The subsequent inquiry found that poor understanding of ethnic influences (i.e., the complex notion of kinship care across international borders) and lack of judgment in the assessment and intervention processes contributed directly to the death of Victoria Climbie (Parton, 2004).

The Climbie case involved many organizations, systems, and professional groups, and highlighted the large amount of poor quality case information (including e-mails, faxes, and paper documents) generated by professionals. The report on the inquiry (Laming, 2003) recommended cohesive, joined-up communication across all child protection agencies. The report was subsequently analyzed at some length. It was acknowledged, for example, that interventions with individuals from a minority background should be carried out by social workers competent in the relevant dialect or language and who have some understanding of relevant words, ideas, and concepts. Professionals also need to be supported by well-trained and managed translation and interpretation services (Chand, 2005).

The Laming Report (Furness and Gilligan, 2010) led to the view that culturally specific communication skills regarding good timekeeping, the use of culturally specific greetings and working with individuals who display humility and deference, should be developed, incorporated, checked out, and acted upon in procedures and processes. Despite the legal and policy influences of the Climbié Inquiry (Parton, 2004), there is little follow-up evidence to suggest that developments on methods that enhance professional engagement have taken place. It may be that insufficient attention to the particularities of culturally sensitive communication and interpersonal skills is a symptom of the national and global development of professional values that, often voluntary, are widely used within social work education (http://www.iassw-aiets.org/global-standards-for-social-work-education-and-training). Social workers may see themselves as competent when working with people originating from countries or regions other than their own. However, professional codes offer general statements that must be supported by context-specific theoretical knowledge and practice evidence (Banks, 2012).

Proponents of reflexive practice in relation to the awareness of self (Fook, 2006) suggest that greater attention needs to be paid to underlying assumptions about how difference is seen, created, and perpetuated in order to improve and develop service interventions. The cultural standards used to provide services for minority groups need to be scrutinized and checked for majority bias. The positive way forward would be to amalgamate and utilize both minority and majority norms within service outcomes (Sakamoto, 2007). This would allow a nuanced, contextualized response to individual needs while taking into account institutional and societal drivers. For example, the use of case files and record keeping by the many welfare organizations involved in the Climbié case received considerable attention (Parton, 2004; Chand, 2005), but not necessarily for cultural appropriateness, cultural currency, or cultural awareness. Chin (2000) recommends a number of ways to develop culturally relevant practice including regular

evaluations of organizational competence and the enhancement of monitoring, access, and quality systems. Detailed scrutiny of population data may also lead to identification of differing needs and highlight factors leading to above average risk for some groups. This may enable service providers to target, prioritize, and respond appropriately. The expectation is that social workers of today are advantaged by well-designed, better-connected systems able to deal with the quality and quantity of electronic communication available to them and to colleagues within and across organizations.

Culturally appropriate or relevant practice can be substantially informed by the use of communication systems such as the Internet search engines and other social media. The knowledge available on cultures is beyond individual reach, but it is likely that contemporary social workers are able to find relevant information quickly and efficiently on a range of issues, such as the impact of the exchange of financial remittances across countries and continents on family income. Social workers safeguarding children and adults have powers to seek knowledge of the individual and his/her ethnicity gained both through face-to-face contact but also through relevant electronically sourced information (e.g., on burial practices). There is limited evidence to suggest that professionals are looking beyond immediate organizational records or using wider media to inform their practice.

Cultural sensitivity suggests the need to base professional judgment on a wide range of information including theoretical, empirical, and practice related (Devore and Schlesinger, 1999). Cultural interventions should be informed by research evidence and data derived from black and ethnic minority individuals, women and other 'ordinary people' Payne (2005: p. 6). The focus should be on what works and what requires further practice and research attention.

Social work policy and organizational change can be bolted on superficially or grounded in well-tested research findings based on consideration of the status quo and the existing cultural norms of the society. Culturally appropriate interventions are multifaceted and require a sound evidence base, but the value of practice wisdom derived from tried and tested methods should not be overlooked. The criteria used should closely relate to the ethnic and cultural understandings of the social problem; for example, the use of indigenous criteria in response to indigenous rehabilitation needs in Australia (Taylor et al., 2010). This approach is likely to acknowledge restrictions and limitations created by situations (Fook, 2003) where the norm is used to benchmark and define other perspectives.

Research evidence from across the world suggests that professionals should not be constrained by procedural constraints and protocols when responding to service user needs. Cultural appropriateness requires the defining, redefining, and adaptation of the social work role and a high level of reflexivity, founded on substantial background knowledge of the issue in question and of the importance of the family and community to the service user. Social workers who develop complex skills in specific expert areas are less likely to pathologize, label, and stereotype.

Gallardo and Curry (2009) explore the importance of personal relationships within Latino groups and how these affect contact with welfare organizations. In a context where sharing information and seeking external support on sensitive topics, such as substance misuse, are seen to be culturally unacceptable by some people, training and support should be available on, for example, the confidential sharing of family history, kinship ties, differences between generations, and the part played by religion and faith in healing processes.

Bernal and Saez-Santiago (2006) suggest cultural centeredness as a better way to understand difference and diversity, as culture can mean many things to many people, including minority groups, who can be as heterogeneous as majority populations. The definition, design, and application of culturally appropriate methods is less problematic if defined in this way within, for example, mental health diagnoses and treatment that can be seen and defined differently by members of the same community.

Social work across the world is keen to develop systemized approaches that better define needs and as a result respond to service users more efficiently and effectively while meeting individual needs in a sensitive manner. The scientific challenge to this is the move in some American states to improve service outcomes through compulsory use of the empirically supported intervention (ESI) guidelines, which promote technological advances to improve service outcomes. ESI has been evaluated for cultural appropriateness by McBeath et al. (2010) who found that the approach is overly clinical and highly procedural. The methods are designed to achieve generic outcomes that do not easily adapt to context, time, and place or follow the particularities of core social work principles, such as client self-determination and respect. The model is a response to the pressure in the United States for large-scale, low-resource interventions, which can and should be replicated in a range of settings and contexts.

Probable Future Directions of Research and Theory

Social workers across the world are engaged on a daily basis in developing theory and practice methods. However, evidence suggests that the focus on culture and ethnicity continues to require professional attention. Knowledge on difference and diversity is still based on majority norms across the globe (Fook, 2006) taking little heed of history and experience relating to factors such as colonization. The literature found for this article on cultural interventions is derived from a range of disciplines but the perspective has in general been that of the professional or academic rather than the service user. This suggests that the views of those receiving services need to be better embedded in practice, research, and theory building.

Another gap relates to the direct links between the social worker's personal history/experience and her/his professional behavior. Although professionals interpret policy on a daily basis and implement targeted, context-specific services, there is little evidence of how they internalize cultural sensitivity.

Families and individuals in need of sensitive interventions are likely to be international by nature and, although movement between countries is important for governments seeking to control welfare, social work should be about recognizing and acting on improving the life chances of such individuals. Too often, the intersections between income, class, and immigrant status are missed leading to poor service outcomes

and institutional improvements. Children, in particular, need confident professionals who are not diverted by color and language and can use human skills to seek and implement change within complex care or family situations.

Attention needs to be paid to the constructs used to define groups in research, in relation to how difference is understood and propagated within professional knowledge. Further evidence is needed on types of interventions, where they originate from and who influenced their developments. While the monitoring and evaluation of processes and methods of intervention are important, practice outcomes and research outputs also require scrutiny for majority norms and cultural bias.

In conclusion, cultural appropriateness suggests that methods and models should vary in range and applicability in line with the populations in question, that is, the combination of scientific methods with individualized and community-based service interventions. Cultural specificity can be of particular concern in one-to-one interactions with service users who may or may not be compliant and/or lack confidence. Within these situations, well-trained social workers can ask pertinent questions, look for information beyond the immediate and find ways around group or family sensitivities in everyday practice. Skills such as these should be fine-tuned rather than overproceduralized. Social work is a relationship-based discipline, which depends on sound intervention strategies, to promote individual change for those in need. This needs to be supported by a societal commitment to macrolevel systemized measures, such as good housing, education, and income, to maximize the life chances of all citizens.

Culture and Actor Network Theory

Abstract

This article examines actor-network theory's (ANT) complex relationships with notions of culture. We start with a discussion of ANT's fundamental works and show how these question common notions of culture. In the second part, we show how current developments in ANT, which empirically focus on arts, markets, care, and democracy, strongly rely on a pragmatist approach to practices. The third part outlines ANT's methodological and theoretical contributions for cultural analysis. In sum, as a perspective ANT suggests a reformatting of what cultural analysis might entail.

Actor-network theory (ANT) as a "theory that maps the social relations between people, objects, and ideas, treating all as agentic entities that form a broad network" (Cerulo, 2009: p. 533) has not only contributed to science and technology studies. Over the last 30 years, ANT has also become an innovative analytical framework for the study of culture. Yet we are confronted with an apparent paradox: while profoundly impacting the study of culture, ANT restrains from referring to the notion of culture, be it as *explanans*, as *explanandum*, or as phenomenon.

This article examines ANT's complex and paradoxical relationships with notions of culture and highlights ANT's implications for cultural sociology. This is a challenging task, not just because culture has been the subject of hundreds of different definitions in the social sciences, but also because ANT remains "an open building site, not a finished and closed construction" (Callon, 2001: p. 65). We start with a discussion of ANT's fundamental works and conceptual repertoires. We show how these works question common notions of culture, including culture as a human realm (as opposed to a natural realm), as a historically constructed mind-set, as semiotic webs of meanings, and as a shared normative orientation to social action. In the second part, we show how current developments in ANT, which empirically focus on arts, markets, care, and democracy, strongly rely on a pragmatist approach to practices. The third part outlines methodological and theoretical contributions for cultural analysis. In sum, as a perspective ANT suggests a reformatting of what cultural analysis might entail.

Networks, Not Culture: A Sociotechnical Approach to Science and Technology

One of the seminal works in the development of ANT is Bruno Latour and Steve Woolgar's *Laboratory Life. The social construction of scientific facts* originally published in 1979. Based on ethnographic research Latour conducted between 1975 and 1977, *Laboratory Life* is an attempt to describe 'the esoteric culture of the scientific laboratory' (Latour and Woolgar, 1986: p. 275). It was inspired by a long anthropological tradition that dealt with the cultural underpinnings of cognition and thereby unveiled the arbitrariness of the Great Divide between the West and the rest. Accordingly, its aim is to apply the same field methods and analytical strategies used to study, for example, Ivory Coast farmers to study first-rate scientists. The book begins to formulate at least three key analytical and methodological principles of what later on would be called 'actor-network theory.'

First, *Laboratory Life* involves elaborating an agnostic description of routine work in the laboratory, without assuming any a priori relationship between the social and the scientific. On the contrary, the intention is to demonstrate how in the actual process of producing scientific knowledge, the very boundary between context and content of science is coproduced. Thus, it problematizes at least two extended types of sociocultural approaches to the study of science. On the one hand, it departs from contextual approaches, which assume that the content of science cannot be the subject of sociological analysis. Such contextual approaches focus instead on institutional frameworks of scientific activity, careers, and status conflicts among scientists or, as Merton (1979) proposes, on the scientific ethos and normative system that would guarantee the strict application of the scientific method. On the other hand, *Laboratory Life* also departs from oversocialized approaches that explain the content of science, its discoveries, facts, and paradigms, by reference to broader societal structures. One example of this is Bloor's 'strong program' (1976) for the study of science, which points out socially and historically produced categories and beliefs that underlie the scientific interpretation of empirical experience. Similarly, *Laboratory Life* presents an alternative to Foucault's (1969) archeology of *epistemes*, understood as the fundamental modes of reasoning that rule the formation and transformation of knowledge for a whole epoch, and the resulting equation of knowledge and power.

This distancing from both types of sociocultural approaches to science eventually led to the erasure of the adjective 'social' in *Laboratory Life*'s subtitle in subsequent editions (1986). In doing so, the authors also repudiate social constructionism. In the mid-1980s, social constructionism was fundamental for the rejuvenation of cultural sociology. Suggesting an alternative to traditional sociological conceptions of understanding culture as values, it understands culture to consist of "symbolic vehicles of meaning, including beliefs, ritual practices, art forms and ceremonies" (Swidler, 1986: p. 273). Culture thus serves as a 'tool kit' people use to solve problems. From a *Laboratory Life*

perspective, this new sociology of culture overestimates the symbolic and assumes context and structure, whereas in fact such divisions do not exist.

Second, *Laboratory Life* reveals the constitutive, agentic role nonhuman entities play in the production of scientific knowledge. This becomes evident in the study of inscriptions (e.g., maps, graphs, illustrations) of 'natural' objects (e.g., a hormone, a soil type, a distant galaxy) produced by technical instruments. Latour and Woolgar (1986) describe laboratory work as the systematic production of experiments and other technical procedures to inscribe or write down the behavior or reactions of 'natural' objects into material and visual media. Furthermore, it also involves translation of visual inscriptions into scientific propositions. Inscriptions thus help to establish comparability, make interpretation possible, and allow for making scientific statements about the natural world. In their ethnographic accounts, they show that nonhuman entities enable and transform chains of reference that constitute scientific facts, and thus argue that distinctions between facts and artifacts need to be overcome.

Michel Callon (1986) condenses these insights into the analytical principle of *generalized symmetry*, according to which the same conceptual repertoires should be used to describe the action of human and nonhuman entities. This radical position, later referred to as 'material semiotics' (Law, 2009), aims to understand phenomena that are completely overlooked by interpretative approaches in sociology and anthropology. Whereas the latter focus on deconstructing cultural texts and webs of meaning (e.g., Geertz, 1985), generalized symmetry describes relationships between heterogeneous, material, and nonsymbolic entities. ANT thus is also incompatible with semiotic readings, for example of systems of objects (Baudrillard, 1996) or fashion (Barthes, 1990).

Third, *Laboratory Life* begins to develop a 'flat' understanding of the circulation of scientific facts and, generally, the social. A key finding was that the robustness of scientific facts depends on the circulation of their inscriptions. Scientific facts move from one laboratory to the next, from there to a journal, then to a policy document, to a ministry office, to an industrial floor, from there to a market, to consumers, to concerned groups, and so on. In their circulation through such heterogeneous local points, scientific facts are constantly tested and contested by other actors. Provided that they endure after different actors have probed into them, they become indisputable scientific facts or, in ANT's terms, 'immutable mobiles' (Latour, 1987), i.e., networks of relationships among heterogeneous elements that remain stable despite their circulation through such diverse local points. The finding that scientific facts exist within such translocal sociotechnical networks led ANT scholars to a radical conclusion: the larger the network, the more objective the scientific fact.

According to this perspective then there is only a 'flat' single-level reality, consisting of larger or smaller networks of always local points. There are no hidden structures, no global levels, or ultimate realities. This leads to a further rejection of common anthropological and sociological understandings of culture(s) as locally bounded entities, knowledge forms, or social realities. For ANT, there is neither the global nor the local, not even a 'glocal society' understood as simultaneously shaped by global and local processes. Instead of a separation of levels, the key question for ANT involves the extension of the socio-material and sociotechnical networks within which social phenomena are constituted.

During the 1980s, Bruno Latour, Michel Callon, and John Law further developed these and other principles collaboratively in what began to be called 'actor-network theory.' This composite notion aims to describe the hybrid and translocal relations that constitute every technological artifact, scientific fact, and social actor. Accordingly, every phenomenon or action is created by a whole network of heterogeneous entities. These entities are called *actants*, since they participate in an actor-network and thus in a collective and distributed action. The notion of *actor-network* was coined to make the tracing of an analytical distinction between an actor and a network impossible. To be sure, a network in ANT's terminology does not define the context in which an actor acts and interacts, as in classic social network analysis and its notion of embeddedness. Rather, any actor is an actor-network since no analytical separation between actor and network exists. Any capacity to act stems from the heterogeneous assemblage of human and nonhuman entities, constituting the actor-network.

One of the key processes ANT describes involves the formation of such actor-networks. In the sociology of *translation*, Callon (1986) describes the sequential processes through which entities and networks cocreate each other enabling new forms of action. It begins with the *problematization* of a situation, i.e., transforming a complex and ambiguous situation in which many entities are involved into a well-defined problem. The second step in the translation process is *interessement*, i.e., generating interest among other entities in the problem defined in the first step, so that other entities recognize this to be their problem as well. Third, Callon speaks of *enrolment* to denote how other human and nonhuman entities are transformed into allies, when their interests and identities are stated in terms of the common problem. Finally, *mobilization* describes the collective action that the translation of these different entities enables. A related concept to describe successful translation is that of *blackboxing*. When a whole network is mobilized in the name of one problem defined by one actor, its heterogeneity and distributed character is blackboxed, so that it seems that one bounded actor carries out the action. Indeed, ANT understands itself as a research program oriented toward opening up blackboxes that hide the hybrid constitution of the social world.

Bruno Latour's *We have never been modern* (1993) most clearly highlights ANT's position toward and its analytical consequences for the study of culture. Drawing upon contemporary anthropological theory, Latour sets out to open the two separate blackboxes of nature and culture, which underlie the constitution of modernity: "the very notion of culture is an artifact created by bracketing Nature off. Cultures – different or universal – do not exist, any more than Nature does. There are only nature-cultures" (p. 104).

In sum, ANT's negative argument characterizes culture as neither contextual nor symbolic, neither explanatory nor autonomous.

After ANT: A Pragmatist Turn in the Study of Practice

With the exception of the explicit rejection of culture in *We have never been modern*, ANT mostly argued implicitly against notions of culture that exclusively refer to the human realm or to a symbolic system providing normative orientation for action. At the same time, ANT's early focus on ethnographic description of sociotechnical practices, highlighting the practical assemblage not just of science and technology, but also of the empirical and the real, positions it within a pragmatist research tradition. While the focus on practices was not central at the time of theory development around the notion of actor-network in the 1980s, it moved center stage in the 1990s. In part, this was a response to the severe criticisms of the notion of actor-network, including that it denies power issues, exhibits male Eurocentricism, and sustains a managerial-functionalist understanding of social phenomena (e.g., Star, 1991). In order to emphasize a new phase of theoretical development that addresses such issues, while leaving behind the conceptual repertoires surrounding the notion of actor-network, Law and Hassard (1999) have even suggested speaking of an 'after-ANT' phase.

Since the mid-and late-1990s, there have been various developments using ethnographic and pragmatist approaches to study the assemblage of objects, spaces, and figures in fields beyond science and technology, while sticking to ANT's analytical principles explained in Section Networks, Not Culture: A Sociotechnical Approach to Science and Technology. As in pragmatism (Dewey, 2004[1916]), these works approach practical activity and experience not as a result of human will or social structure, but rather in terms of its consequences for the constitution of reality. As evident in *Reassembling the social* (Latour, 2005a), ANT staunchly rejects Pierre Bourdieu's (1990) practice theory. The general criticism of Bourdieu hinges upon his idea that 'hidden social structures' predetermine actors' positions in the social world and endow them with a practical sense. Rather than understanding social practices as expressions of internalized social structures, ANT's pragmatist approach studies actual practices in concrete sites and situations, so that the entanglements of human and nonhuman entities enabling certain forms of action can be examined. Four key contributions testify to this interest in practices beyond practice theory. They relate to the notions of attachment, performativity, enactment, and engagement.

In his work on music, Antoine Hennion (1993) studies the practices of the production of aesthetic value and thus the results of artistic production along the entanglements of human actors and material objects. Hennion points out that traditional sociology has assigned a peculiar role to objects in the study of cultural products: while technoscientific objects are often reduced to a technical dimension, cultural objects are conceived of as social intermediaries, i.e., symbols, meanings, or value-laden signs. Thus, traditional sociology views art works as the material production of ourselves as a collective entity. The transformations, resistances, and mediations arising from the material or technical existence of art works are entirely absent. Hennion's work, in contrast, shows that material objects, e.g., instruments, notation systems, recording technologies, reproduction devices, and music halls, are 'mediators.' Such mediators are "neither mere carriers of the work, nor substitutes which dissolve its reality; they are the art itself" (2003: p. 84). Thus, this approach emphasizes the coproduction of cultural products, producers, and audiences. Furthermore, in rejecting Bourdieu's notions of habitus and taste formation, Hennion shows how taste develops as a reflexive practice in situations, in which actors attach themselves to objects and develop abilities to perceive and experience them. Taste, understood from an ANT perspective, is thus a situated performance rather than the result of socially structured preferences (Hennion, 2007).

ANT's criticism of culture as context and its pragmatist turn can also be found in Callon's research program for the study of markets. Arguing against the primary focus on the sociocultural embeddedness of economic action, Callon's (1998b) seminal contribution expands economic sociology to now include the notion that "economics make the economy." He thus coins the idea of the 'performativity of economics.' Accordingly, economics should not be seen as providing true or false descriptions of economic processes. Rather, economics should be understood in terms of constituting economic worlds within which economic models, formulas, and even figures such as *homo oeconomicus*, can be said to exist: no economy without economics. Callon (2007) shows that the performative force of economics does not stem from a purely linguistic or symbolic effect, but rather from the constitution and mobilization of sociotechnical networks or *agencements*. Similar to pragmatist notions, Callon (1998a) points to dynamics of framing/overflowing in order to understand economic goods and agents, prices and transactions as relational and situational achievements. Expanding Goffman's (1974) frame analysis, Callon emphasizes that market frames depend on the sociomaterial arrangements of objects, devices, formulas, and technologies rather than on shared taken for granted assumptions and normative orientations. Such frames then enable economic calculations. However, since overflowing instead of framing is the rule in market dynamics, studying economization practices and processes requires being "acutely attentive to the plurality and open-endedness of 'the economic' as it is brought into being" (Caliskan and Callon, 2010: p. 2).

Another study of practices in concrete sites is Annemarie Mol's (2002) *The body multiple*. In her empirical study on medical practices, she finds that the body, going through different units in a hospital, is a multiple object. Its multiplicity is ontological and involves different practices of bringing bodies into being; this multiplicity does not result from different perspectives, ways of observing, and knowing a single body. Mol proposes the notion of enactment as a means of understanding how objects exist through multiple situated practices. Thus, she also distances herself from the classic ANT approach to immutable mobiles, in which a stabilized result stems from a process of construction. Enactment instead is situational and it reveals the coexistence of multiple stabilizations. Thus, the practical challenge that Mol describes with regards to bodies in hospitals is not one of translation, but rather one of coordination, i.e., how multiple enactments are brought together or kept apart, in order to arrive at a diagnosis.

A further connection to a pragmatist tradition can be seen in works using John Dewey's (1927) ideas on democratic publics. As Dewey points out, the main problem Western democracies confront is that they take the existence of a public

for granted. Instead, publics are formed around complex issues involving unintended consequences, which escape institutions and cannot be managed. According to Latour (2005b), this pragmatist understanding of democratic publics reveals that politics cannot be considered as a purely human matter involving conflicting ideals, norms, values, or interests. Rather, these publics indicate that the hybrid objects of science, technology, medicine, or urban development play a generative role in the constitution of publics and in enabling political activity. Thus, Latour speaks of an *object-oriented politics*. In addition, Marres (2009) explores the role played by practices and devices of public engagement. Her work demonstrates that this involves studying a broad range of practices of issue formation beyond formal participatory events and procedural settings, which are constrained by set issue definitions. Understanding public engagement requires more than just studying discursively constructed frames. Rather, public involvement needs to be studied and explained in terms of the actual attachments between publics and objects that define such public issues.

It is important to note that none of these new lines of ANT research explicitly use the notion of culture. However, as we have shown, they propose pragmatist readings of practices of assembling, enacting, publicizing, attaching, mediating, and performing realities.

Nonhumans, Description, and Ontology: Cultural Analysis after ANT

In conclusion, three general observations regarding ANT's methodological and theoretical contributions for cultural analysis follow:

In general terms, ANT has arguably heightened awareness and sensitivity toward the active role nonhumans, including animals, technologies, objects, or materials play in the phenomena and dynamics studied by social sciences. ANT approaches are thus not just increasingly mobilized for the study of overtly hybrid phenomena, such as carbon transitions, nuclear crises, or the quest for sustainable development, but are also translated as a more general methodological and analytical strategy. One translation can be found in the works of Luc Boltanski and Laurent Thévenot (2006), two pragmatic sociologists. Studying the justifications actors use in disputes and disagreements, they show that the involved actors do not merely rely on words. Rather, in evaluating a situation, actors bring together words, as well as human and nonhuman actors, in tests and thus shape different orders of worth. Economic and cultural sociology have particularly picked up on these insights and are currently analyzing processes of valuation and the constitution of different orders of worth, including nonhuman actors in their analyses (Fourcade, 2011; Stark, 2009). In the field of urban studies, ANT perspectives are particularly helpful to grasp the sociomaterial assemblages of cities and are at the center of current debates (Farías and Bender, 2009; Brenner et al., 2011).

A second important aspect relates to the role of description in ANT accounts. The sensitivity to nonhumans is a result of ANT's methodological commitment to produce detailed descriptions of actual activity, as delineated in the case of the laboratory ethnographies. But descriptions can also be an analytical strategy, allowing social scientists to question traditional accounts based on contexts or causal explanation. Accordingly, the challenge is to describe how actors create contexts for their own action and how some events lead to other events. Thus, contexts and causes become empirical objects to be described. In turn, description becomes a methodological and theoretical device, as opposed to positivist visions of descriptions as simplistic accounts and 'just-so-stories.' Therefore, ANT contributes to a larger sociological movement of 'descriptive sociology' (Savage, 2009), which is also prominent in pattern analyses over time, and in relational methods that make use of visualizations (Mützel, 2009). This usage of description as an analytical tool means that, for example, cultural products, such as art or fashion, should not be explained as a result of the culture of a certain class, city, or nation. Rather, social scientists need to describe and analyze how cultures are being practically assembled through such products (Entwistle and Slater, 2013).

Yet another contribution of such a commitment to meticulous descriptions of whole worlds is a turn toward ontological questions. The strict separation of culture from nature and the social from the material, so strongly underlying social sciences, has confined these questions to the realm of epistemology. While focusing on human beliefs, attitudes, images, and representations of the world, questions about ontology have generally been neglected by both positivist and constructivist social sciences. ANT's contribution is to direct attention toward the study of how reality comes into being.

Abstract

Both historical studies and econometric analyses find that high levels of economic growth are associated with values such as achievement motivation, future orientation, and eagerness to learn. Opinions differ with respect to the direction of the causal relation, if any, and the role of formal institutions. Some regard formal institutions as of more importance than values. Future research should focus on the time pattern of changes in values, institutions, and economic performance and take a close look at the influence of power.

Introduction

Max Weber's the 'Protestant Ethic and the Spirit of Capitalism' is regarded by many as the classical work on the relation between religion and economic development. Often the implicit suggestion is that it forms the start of research on the relation between culture – in the sense of norms and values – and economic growth. In fact, it marks the start of a period in which economic research began to ignore culture. From the time of Adam Smith, who is considered to be the founder of the economic science, until the beginning of the twentieth century, culture was part of economic science, although it was not often explicitly mentioned as such. Weber's work can be seen as the study, which made culture more explicit. From then onward culture was part of anthropology and sociology, and economics developed into a study of human beings optimizing their objective function under the constraints of available resources. After World War II, the discipline was dominated by mathematical and econometric approaches. These quantitative studies left no room for vague concepts such as culture. The subfields of development economics and international business remained exceptions in that they still paid attention to culture.

The dominant post–World War II model of economic growth has capital and labor as inputs. Only the quantities of these production factors matter. Later models of economic growth also take the quality of these inputs into account. In particular the quality of labor can be different between countries depending on the quality of the countries' educational system. This opens the possibility of including as explanatory variables the quality of the educational system and of national institutions. Recently, this has lead to models including culture as one of the determining factors of growth.

The factors that lead to a reemergence of culture in economics can be divided into two groups: developments in the economy and a disappointment with the results of the mathematical models. In the beginning of the 1990s, it became clear that from 1960 onward, some East Asian countries had shown high levels of economic growth. Many were surprised by the success of these newly industrialized countries (NICs). These countries (Taiwan, South Korea, Hong Kong, Singapore, and Malaysia) were not those which in the mid-1950s were mentioned as candidates for success. This unexpected success of the NICs triggered a debate on the Asian Miracle, which ended in the conclusion that so-called Asian values – such as group spirit, mutual assistance, and thrift – were conducive for economic growth (see the literature referred in Khoo Boo Teik, 1999; Chong, 2002).

The fall of the Iron Curtain in 1998 was another event that set off a discussion on the relevance of values for economic growth (Blanchard et al., 1994; Murrell, 1995). The discussion concentrated on the best tactic to introduce a market economy in the former centrally planned economies. Neo-classical economists advised a shock therapy by which free market institutions would be introduced as soon as possible (the authors in the edited volume Blanchard et al., 1994). Others (Murrell, 1995), however, plead for a gradual approach. In their view, the years under communism had led to a culture in which citizens expect the state to take care of and decide on many aspects of life; thus it would take time for the inhabitants of these countries to change their attitude toward a more active stance and to take more responsibility for their own life.

In addition to economic development, developments in economic theory also led to an interest in culture. General equilibrium theory was able to demonstrate that in competitive markets the general equilibrium equations had some solutions. However, it proved to be impossible to show that there is just one (unique) solution toward which the economy converges. Other approaches made unrealistic assumptions in order to obtain any solution. Rational expectation models form an example of such an approach. In these models, economic agents are assumed to foresee developments into the far future and select the one and only path that leads to the stable equilibrium. These unsatisfactory results and assumptions gave rise to an interest among economists in alternative theories and concepts, such as bounded rationality, institutions, and culture in the sense of norms and values. The interest in culture was also stimulated by the fact that databases of cultural dimensions (Hofstede, 2001; Schwartz, 1994), and measures of people's values across the world (European Values Survey and World Values Survey) became available, so that empirical studies on the relationship between values and economic phenomena became possible.

Three Phases of Economic Development

Three phases of economic development provide insight into the relationship between culture and economic change

(Marini, 2004). Marini has defined these phases on the basis of matching findings of socio-psychological research with the literature on the role of culture for economic growth. Each phase is characterized by a particular level of economic growth, income per capita, and values. The preindustrial or antiquity is the first phase. In this phase, income per capita is low and economic growth is almost absent. Extended families and communities are buffers against economic hardship, which correspond with communitarianism and collectivism. The lack of sight on any progress leads to fatalism and an orientation on the past instead of the future. Industrialization is the next phase. During this period, economic growth is high and income per capita increases sharply. Economic growth is stimulated by technical progress and high levels of savings. Success in economic terms is rewarded to the individual, and the high levels of growth enable relatively large groups to escape from poverty. Associated with these events are an orientation on the future, achievement motivation, and an appreciation of hard work and materialism. The third and final stage is the post-modern or postindustrial period. It is characterized by high income per capita and relatively modest levels of economic growth. In principle, the entire population can take survival for granted. With it goes a change in dominant values. Self-expression and quality of life become more important than materialism and physical security. These values are in high esteem "*after* people have attained material security, and *because* they have attained material security" (Inglehart, 1997: p. 35).

Figure 1 summarizes the three phases inspired by the ideas of new institutional economics, which is an economic perspective that extends economics by including social and legal norms and values. In this mode, economic performance is determined by culture, formal institutions (written laws), and governance. The latter refers to the way members of a society normally treat each other without using the formal institutions of court and law: whether one seeks consensus or wants to fight out conflicts. The columns of institutions and governance are empty; we come to that at the end of this contribution.

Economic development is understood as the transition period from the preindustrial (often agrarian) stage to industrial society. The important question is then whether and how culture stimulates or hampers this transition. A related issue is whether it is culture or the formal institutions that are primarily responsible for this transition. These questions have been studied by means of historical and anthropological, in-depth analyses and cross-country regression analysis.

Historical and In-Depth Case Studies

Historical and in-depth studies range from covering a short time period or more than a millennium. Banfield (1958) is a good example of the former. His work describes in detail the society of a small poor village in southern Italy in the 1950s. A culture focused on the interests of the nuclear family is unable to organize activities for the collectivity, even though the latter would benefit all. Anxiety, suspicion, and hate make cooperation burdensome. Banfield regards the region's isolation, its high death rate, and the related fear of orphanage and neglect as important determining factors for this self-interest. It is a good description of what is meant by a backward society and how dominant values seem to consolidate the status quo. At the end of the book, Banfield suggests that some innovations such as formal education and apprenticeships may disrupt the status quo.

In contrast, the role of culture in supporting economic change is illustrated in the studies collected in Harrison and Berger (2006). For example, in a Nigerian town the traditional

Figure 1 Values, institutions, growth, and income per capita. Source: Adapted from De Jong, Eelke, 2009. Culture and Economic: On Values, Economics and International Relations. Routledge, London (Figure 7.1).

habit was to have many children because a prosperous community was thought of as one with many people. These children were raised by the community. Formal education according to Western standards changed the attitude of young townspeople. They thought fostering as exploitative and as detrimental to the development of the children. Literacy and basic math competence taught in school enabled people to communicate with government's officials. The study on Japan (Kunio, 2006) in the Harrison and Berger's book illustrates the importance of culture for the change from a period of growth to that of an affluent society. According to Kunio, Japanese firms find it difficult to change from the community oriented progrowth strategy to one, which leaves more room for the individual (p. 98). Moreover, Japan is finding it difficult to reduce the government's involvement in the economy.

Historical studies covering a millennium or even a longer time period and a wide range of countries can disentangle the various factors that during several periods have contributed to development and stagnation. An important question dealt with in this type of studies is: why was it that European countries were so successful in the sixteenth and seventeenth century and why not China and countries in the Middle East? At the beginning of the Christian era, the world's scientific center was in the Middle East. Many of the techniques developed by the Europeans during the Industrial Revolution were known to the Chinese. For example, in the thirteenth century China had a power driven spinning machine, whereas in England such a machine was invented about 500 years later. Similarly, by the later eleventh century China knew how to use coal in blast furnaces for smelting iron. About 700 years later, this invention came in Britain, while in the mean time coal smelting had fallen into disuse in China (Landes, 2006: p. 6). Moreover, in the fifteenth century, China had implemented a policy of closure, which meant an abandonment of a program of great voyages. Landes (1998) ascribes the Chinese failure of making a commercial success of existing techniques and their decision to stop exploring the oceans to a lack of curiosity. The Chinese "went to show themselves, not to see and learn. … They were what they were and did not have to change" (Landes, 1998: p. 96). Success was there for those who were open for foreign influences and ideas, and were eager to learn. Moreover, individuals should have the freedom to experiment and be rewarded for their efforts; "freedom first, economy later; because freedom is a necessary if not sufficient condition of development" (Landes, 1998: p. 432).

The importance of freedom for economic development is underscored by Lal (1998), who ascribes a large role to individualism, which distinguished Europe from more ancient civilizations in Asia and the Middle East. This individualism stresses the nuclear family and romantic love instead of the traditional extended household. The move toward individualism was the unintended consequence of measures taken by popes in the sixth and tenth centuries. In the sixth century, Pope Gregory I forbade marriage to close kin, close affines or the widows of close kin, concubinage, and the transfer of children by adoption (Lal, 1998: p. 83). Al these four practices can be regarded as strategies of heirship such as ensuring the inheritance of family property and of the provision of a heir. By forbidding these practices the pope inhibited a family from retaining its property and stimulated its isolation. As a consequence, chances would increase that the church would obtain the property. From the tenth century onward, the enormous accumulation of property by the church raised opposition from within and outside. In 1075, Pope Gregory VII reacted by enforcing the celibacy of the clergy and the extension of the prohibitions to marry, measures which secured the church's ability to secure its property. Moreover, he declared the supremacy of the pope over the church and over secular matters, and the independence of the clergy from secular control. Excommunication was the pope's instrument for enforcing his will. The measures of pope Gregory I enhanced individualism and those of Gregory VII lead to a bureaucratic apparatus, such as a professional judiciary and a treasury needed for making the legal system work. These developments created the institutions of a market economy, which led to high levels of growth in later centuries.

However, institutions established in previous centuries can also hamper economic growth in later periods, as is illustrated by Kuran (2011). He argues that Islamic law and in particular its inheritance law has held back the Middle East. The Islamic inheritance system had very egalitarian rules, which gave women financial security and dampened wealth inequalities. However, combined with the possibility of polygamy it also precluded that a fortune could be inherited by a few successors. Consequently, large firms could not be established. The only means of accumulating wealth was the *waqf*, a form of trust. A *waqf* allowed the use of the return on assets for providing services in perpetuity. However, a *waqf* could not easily change its goals so that it meant a transfer of money from flexible commercial use to an inflexible charitable one. The degree of flexibility depended on the willingness of the local imam. Finally, Islamic contract law lacked any entity shielding, so that a partnership had to be dissolved on if any member or third parties asked for it. The death of a partner terminated the partnership automatically and gave claims to his heirs at the costs of the other partners. All these characteristics of Islamic law precluded the existence of independent, long-lasting large commercial firms. Consequently, trade and other economic activities remained small and were formalized in short-lived partnerships. Laws were changed when in the nineteenth century the disadvantages became too obvious; the Christian and Jewish traders became very rich compared to their Islamic counter partners. However, over the centuries, regulation had stimulated corruption, reduced mutual trust, and undermined civil organizations.

In principle, a historical analysis over a long period enables one to disentangle the causal effects between culture and economic growth. However, it is very difficult to obtain reliable information on dominant values for periods in the distant past, let alone their exact timing. This lack of information hampers studies on the relationship between values and economic performance, in particular when one is interested in the causal direction. As a result, in the end the findings of these historical studies depend to a high degree on the researcher's ability to disentangle the different aspects from the abundance of information provided. The above summary of Lal's study of the Western success and Kuran's investigation of the Middle East's failure illustrate the subjectivity of these studies. Lal tends to emphasize values more than Kuran does.

A way to circumvent this high level of subjectivity might be provided by quantitative studies.

Cross-Country Quantitative Studies

During recent decades, quantitative information has become available on dominant values in a wide range of countries. In 1980 Hofstede was the first to publish national cultural dimensions for a large set of countries. Later initiatives include the dimensions developed by the Israeli psychologist Shalom H. Schwartz, the World Values Survey, the European Values Survey, and the Global Leadership and Organizational Behavior Effectiveness research program (for a review see Appendix 1 in De Jong, 2009). These data sets allow for assessing the role of culture through cross-country regressions, in which growth in per capita income is the dependent variable and culture is among the set of explanatory variables. The latter includes income per capita at the beginning of the period. Its expected coefficient is negative; countries that have relatively low income per capita at the beginning of the period are expected to grow faster over the subsequent period and thus their income converges to that of the richer countries. The other explanatory variables can be derived from the literature on economic growth.

Several variables are suggested as proxies for culture. Inspired by, among others, the work of Putnam et al. (1993), some studies have used trust for explaining economic growth and income per capita. Trust is measured as the percentage of respondents in each country that replied 'most people can be trusted' when asked 'generally speaking, would you say most people can be trusted, or that you cannot be too careful in dealing with people?'. Trust appears to be positively associated with annual growth of income per capita (Knack and Keefer, 1997; Zak and Knack, 2001). The argument is that people who trust each other don't have to rely on costly institutions that ensure the execution of the counterparty's obligation. As a consequence, high trust leads to a more efficient society and growth. Beugelsdijk (2006) argues that this is an argument based on a microlevel concept of trust, whereas the trust question refers to the macrolevel, where it is related to the functioning of the bureaucratic system. People trust each other because they know that in case of misbehavior they can rely on courts to defend their rights. A principle components analysis finds trust in a component with measures of institutional strength. In conclusion, the trust variable seems to measure both values and the quality of institutions.

Strong desires to achieve on the part of at least some people are considered by McClelland (1961) as the cultural factor contributing to economic growth. During other phases of economic development, values as obedience and quality of life are regarded as more important (see **Figure 1**). Granato et al. (1996) and Marini (2004) construct a cultural index representing each of these stages by means of the answers given in the World Values Survey when respondents were asked to mention five qualities they teach their children out of a list of 11 items. Qualities are for example obedience, independence, thrift, and hard work. Both studies find a positive influence on economic growth for cultural indices of achievement motivation vs obedience. Williamson and Mathers (2011) use a similar procedure and explicitly confront the proxies of culture with those of formal institutions. They find that both types of proxies have a positive influence on economic growth. However, institutions enhancing economic freedom appear to be more important and more often significant for explaining economic growth than proxies of culture.

Another group of authors is inspired by Weber's hypothesis that religion is an important explanatory variable for economic growth (e.g., Grier, 1997; Noland, 2005; Barro and McCleary, 2003). Two types of variables are used. The first type measures whether respondents belong to a particular religion. Grier (1997) finds that in a group of 63 former colonies, protestantism is positively and significantly related to real (gross domestic product) GDP growth and GDP per capita is higher, the higher the percentage of protestants in countries. In a similar vein, Noland (2005) studies the influence of religious affiliation on per capita economic growth and on total factor productivity. He finds that Islam is not a drag on growth. In some studies the answers on aspects of belief are representing religion. Barro and McCleary (2003) use the answers on questions about respondents' beliefs in afterlife, heaven, and hell. They find that in particular belief in hell is positively correlated with economic growth, even if they included monthly church attendance as a representation of the costs associated with acquiring theses beliefs.

Individualism vs Collectivism is an important if not the most important cultural dimension. Çigdem Kagitçibasi (1994: p. 52) even labels the 1980s "the decade of I/C". Individualism is often found to be advantageous for innovation. The production process of newly innovated products needs coordination, which Gorodnichenko and Roland (2011) assume to be more easily be arrived at in collectivistic societies, such as many Latin-American countries and countries in Asia (Indonesia, South Korea, and Taiwan). Their model of this trade-off between the innovational advantages of individualism and the production advantages of collectivism, also assumes that the social status reward for developing a better technology is positively associated with individualism. In their empirical part they find that output per capita is positively related to individualism. This relation is robust for including institutions and other measures of culture.

A cross-country regression analysis delivers the factors that explain the *relative* position of a country in a group. This implies that the results depend on the countries selected for the analysis. Beugelsdijk (2006) and Beugelsdijk et al. (2004) show that the positive effect between trust and economic growth found in Zak and Knack (2001) is driven by the inclusion of developing countries in the sample. An analysis restricted to developed countries only does not find any significant positive influence of trust. The coefficient's level of significance increases by the inclusion of countries with lower GDP per capita and lower levels of trust. Williamson and Mathers (2011) make subsamples and find that both culture and institutions are significant in relatively freer countries.

The Role of Institutions

Many authors argue that formal institutions are much more important for economic development than culture (see e.g., Williamson and Mathers, 2011). Institutions such as secure

property rights will give individuals the incentive to invest and thus lead to development. Acemoglu et al. (2001) argue that the current differences in GDP per capita in large parts of Asia, Africa, and America are related to the quality of current institutions that are determined by the institutions brought to the countries by European colonizers. The latter established good institutions in countries with a climate favorable for settlement. Within Europe the countries that grew fastest after the fifteenth century were the countries with access to the Atlantic and with institutions that curbed the influence of the monarchy (Acemoglu et al., 2005). As a consequence, whereas the access to the Atlantic lead to prosperity in Portugal, Spain, The Netherlands, and England, the latter two countries showed a more rapid growth as they were better able to curb the absolutist power of the monarchy.

This discussion has a tendency to set formal institutions against culture as understood as local values and beliefs. As illustrated in **Figure 1**, however, culture and formal institutions are related and, unless they are imposed by foreign forces, culture and formal institutions are complements and might reinforce each other. In the earlier mentioned study of a South Italian village, Banfield (1958: p. 34) notes that "centuries of oppression have left the peasant with a pathological distrust of the state and of all authority". From an outsider's view, villagers seem passive and lack the aspiration for improving their circumstances. This attitude is reinforced or caused by a law passed in fascist times, which prohibits a villager to go to a town and look for work unless he has obtained permission by the provincial authorities (Banfield, 1958: pp. 58, 59). Here one can argue that institutions breed a passive attitude. Another example of the effects of formal institutions on attitudes is provided by Kunio (2006). In his view, the lifetime employment provided by Japanese firms generates a strong sense of identification of Japanese employees with their company.

Another criticism on the literature about the role of institutions in promoting economic development concerns the fact that almost all authors argue that institutions enabling private initiative are progrowth. Some, among whom Chang (2008) is prominent, argue that it is not always promarket institutions that are progrowth. He takes the success of Asian countries as an example to illustrate the possibility for governments to arrange growth. Moreover, promoting promarket institutions in countries, which are not suited for these rules can even do more harm than good. Finally, he notes that the governments who are now advocating free markets (Britain and the United States of America) used protective measures during their own growth phase. This fact is also noticed by Landes (1998: p. 266).

A way of disentangling cultural factors from institutional ones is by studying the culture and performance of districts, which have common national institutions. Putnam's et al. (1993) study of regional patterns of civic engagement and governments' performance in Italy is a good example in this regard. He measures civic engagement by the number of sports clubs per inhabitant, the degree of readership of newspapers, and the turnout in referenda, where voting is not obligatory. A regional government's performance is measured by items as: the number of cabinets during a 10-year period, the speed by which the annual budget is improved, the ability to use nationally allocated funds for the intended purpose. Regional governments appeared to perform better in regions with a high level of civic engagement, which he also labeled as social capital. Moreover, the government is less efficient in regions where local rulers are relatively frequently visited by citizens and a high percentage of these visits are requests for a job or another favor. Putnam concludes that social capital, which includes mutual trust, is crucial for the well functioning of institutions.

Politicized Culture

Scholars have understood culture to be a general trend to which the majority of the population adheres, people's ingrained attitudes toward different aspects of life. In this view, cultural is a neutral process in which no particular party plays a specific role. More recently, however, some scholars emphasize that culture is often consciously created by power holders to justify their actions and privileged position. We have labeled this politicized culture; a purposefully created view on the development and origins of a group (mostly nations) created by political leaders (De Jong, 2009: p. 101). Recent examples are the Asian and Islamic values debate in Malaysia (Maseland, 2006) and the African renaissance under Mbeki in South Africa (Bernstein, 2006).

In the early 1980s when Malaysia was in a recession, Mahathir, the then prime minister of Malaysia, launched the Look East campaign (Maseland, 2006: Chapter 5). Japan and Korea figured in this campaign as models for economic growth. The Eastern work ethic, which was thought to be an important explanatory factor in these countries' success was stressed as an example for the Malays. Later on, during the boom of the late 1980s and 1990s, the campaign stressed that such values already existed in Malaysia, are present in Islam, and hence part of the Malaysian heritage. At that time Mahathir organized an Islamization of public life, in which contents of Islam were promoted, which are in accordance with economic reforms. The pursuit of knowledge, thrift, and hard work were argued to be basic Islamic values. This view was summarized in Vision 2020, the ideological agenda of Mahathir formulated in 1991. Whereas in the 1970s in his The Malaya Dilemma, Mahathir had characterized the Malaya culture as backward, in the 1990s he pointed at the economic success and capabilities of the Malaya, summarized in the slogan "Malaysia Boleh!" (Malaysia can).

The African Renaissance is the invented element of South African politicized culture (Bernstein, 2006). It is promoted by President Thabo Mbeki and a small group of followers. Elements are the attack on African inferiority, and the promotion of African dignity. It shows pride in Africa's heritage but also in its capacity to modernize and take responsibility. African Renaissance "enables its proponents to advocate economic reform and democratic governance … as aspects of an African renaissance and prerequisites for the continent to claim its rightful place in the world. Essentially, it saves face while promoting intrinsically Western ideas about change for the continent" (Bernstein, 2006: p. 27). While the African renaissance can serve as a tool and set of beliefs for the leaders,

it seems to have less impact in the South African people in general (Bernstein, 2006: p. 28).

Causality

The causality between culture and economic development has been debated from the very beginning. Weber's protestant ethics is not a uniform plea in favor of the determining role of culture for economic development. On several places and in particular in the numerous footnotes, Weber shows that he is aware of the reverse causality. For example, the dominant position of protestants in the industry, can in his view, partly be ascribed to historical circumstances 'in which religion affiliation is not a cause of the economic conditions, but to a certain extent appears to be the result of them' (Weber, 1930: 2001, p. 4).

Historical analyses and case studies allow for studying the causality by clearly figuring out the timeline of the events. However, the lack of reliable information on attitudes and dominant values in the past hampers such an analysis. The cross-country regressions make use of values, which unfortunately are often measured only once or twice. As a result, one cannot disentangle the time pattern of the values, so that it becomes almost impossible to investigate the causal relation between culture (values) and economic growth. Culture could be a determining factor of growth, but the causality could also run in the reverse direction; reverse causality. Econometric studies tackle reverse causality by means of instrumental variables (IV) estimators. This estimation process consists of two steps. The first step explains the endogenous values by means of exogenous variables, which are not related to the present level of economic growth. In the second step, the fitted values of the first step regression replaces the original data. Tabellini (2010) is a good example of this approach. In his first step regression he assumes that the literacy rate at the end of the nineteenth century and political institutions in previous centuries explain the level of trust (his proxy for culture) in the 1990s. The fitted values of this regression of trust are found to influence the regional differences in per capita income in the 1990s. In this way the exogenous part of trust (culture) is only incorporated in the regression and the econometric problems associated with the endogeneity problem are solved. However, no information is obtained about the time pattern of culture and economic growth and thus about their mutual influence.

The only way to solve this problem is to measure these phenomena over time. A few studies have done so. Allen et al. (2007) use a quasi-longitudinal approach; in 2002, they used the same questionnaire and a sample similar (in the sense of respondents' age and sex) to the sample used by a study from the beginning of the 1980s for eight Asian countries. They find that GDP per capita is associated with certain value patterns; more submission, embeddedness and hierarchical in relative poor countries and more support for autonomy and egalitarianism in richer countries. The relation between 1982 values and subsequent economic growth was weak, whereas per capita income in 1982 correlated strongly with subsequent change in values. This supports Hofstede's finding that an increase in income per capita leads to an increase in individualism (2001: p. 255).

Ways Forward

As discussed in this article, arguments suggest that a period of economic growth is associated with values such as achievement motivation and future orientation. Research on the direction of causality between values, institutions, and economic growth, however, yields inconclusive results. Historical studies tend to conclude in favor of values driving institutional change and thus economic growth. Recent empirical studies deliver evidence for the opposite causal direction. Consequently, the direction of causality between values, institutions, and growth remains on the agenda for future research.

Such an approach should focus on the time pattern between these three concepts. The current practice of applying IV estimates in cross-section regressions is unsuitable for such an investigation. Analyses based on longitudinal data sets such as the World Values Surveys, along with more detailed historical accounts appear to me as more promising. If possible as many countries and periods as possible are included in these studies in order to investigate under which conditions certain outcomes prevail.

Although certain values are dominant in periods associated with high levels of economic growth, this does not imply that countries or regions in which at this time these values are not important, will not see growth in the future. Evidence suggests that these values are correlated with the phase of economic development (see **Figure 1**). Other values can be correlated with the way a society is organized. Hofstede's cultural dimension: uncertainty avoidance, for example, is often found to be important for explaining cross-country differences in institutions. However, it is uncorrelated with economic growth (De Jong, 2009: Chapters 5 and 6). This suggests that some cultural dimensions are important for explaining differences in the way societies are organized, whereas others are associated with the phase of economic development. In accordance with this is the idea that economic growth does not require a specific set of institutions. This idea is represented by the empty cells under institutions and governance in **Figure 1**. More systematic research is warranted to investigate the claim that different values are associated with the organization vs the growth phase of countries.

By far the majority of studies on values and economic performance are written by Western scholars. A basic principle in cross-cultural research is to avoid a cultural bias. At the end, researchers are also formed by the culture they were born in. Contributions by scholars born in non-Western countries are very welcome to limit the cultural bias that is present in the current literature.

Abstract

The article begins by providing the definitions of economy and culture, and then reviews classical sociologists' contributions to the topic. Next, we distinguish between two approaches. The first one uses culture as a starting point of inquiry, and examines the production and distribution of cultural objects and corporate and market culture. The second approach focuses on explaining economic phenomena through an examination of the regulatory and constitutive effects of culture on them, including in spheres of production, consumption, and economic development and globalization. In the second of these two approaches, conceptual differences are made between considering culture as part of the context that shapes economic outcomes and examining culture as constitutive of economic processes. Understanding economics as a cultural system and performativity of economic theories is also discussed.

Economy, Culture, Defined

Economy is "that complex of activities which is concerned with the production, distribution, exchange, and consumption of scarce goods and services" (Smelser and Swedberg, 2005: p. 3). Culture can be defined as "symbolic vehicles of meaning, including beliefs, ritual practices, art forms, and ceremonies, as well as informal cultural practices such as language, gossip, stories, and rituals of daily life" (Swidler, 1986: p. 273). DiMaggio (1994: p. 28) calls for an analytic distinction between forms of culture that are "characteristically constitutive (categories, scripts, conceptions of agency, notions of technique) and forms that are predominantly regulatory (norms, values, routines)."

Given the breadth of instantiations of both culture and economy, an inquiry into their relationship implies a great variety of possible venues for research. In this article, we limit our survey to two broad approaches. The first one uses culture as a starting point of inquiry, and examines the production and distribution of cultural objects, cultural industries, corporate cultures, and broad characterizations of how economic principles penetrate contemporary zeitgeist. We review this literature briefly as readers can find more information in the separate articles on these topics. The second approach uses economy as a starting point of inquiry, and focuses on how culture influences economic production, organization, consumption, pricing/valuation, and macrolevel development and globalization. Following DiMaggio's (1994) analytic distinction, we point to conceptual differences in considering culture as part of the context that shapes economic outcomes from that of examining culture as mutually constitutive of the economy, including the role of economic theory and the discipline of economics in this construction process.

Classics on Culture and Economy Connection

Even if sociology classics paid most attention to the changing economic conditions of modern society brought about by the industrial revolution, they have all, to varying degrees, discussed the relationship of these economic developments to culture. Karl Marx emphasized the material relations of capitalist production, or the material base, as determining of "the superstructure," or forms of social consciousness. Weber and Durkheim argued for a greater autonomy of culture and its independent influence on economic outcomes. In *The Protestant Ethic and the Spirit of Capitalism*, Max Weber wrote about the influence of religious worldviews on economic pursuits. For instance, a believer in ascetic Protestantism is driven by a desire to be saved and a belief that meticulous and hard work in the secular sphere represents a means of salvation, and success in the secular sphere symbolizes to others one's place within the elect. In *Economy and Society*, Weber defined economic action as social action to emphasize that economic action is behavior invested with meaning that is oriented to some other actor, emphasizing both meaning making and relationality in economic exchange. Emile Durkheim argued that members of a society share a collective consciousness, or an agreed upon system of morals, values, and symbols. He pointed to the noncontractual basis of contracts as a prime example of how economic behavior relies upon this collective consciousness: the normative expectations of society inform how contracts are conceived and respected and thereby facilitate and legitimate contracts beyond their terms. Further pointing to the moral foundations of economic behavior, in his *Professional Ethics and Civil Morals*, Durkheim placed religious beliefs affirmed through ritual practices at the basis of the inalienability of property and as motivation for upholding contracts. Previewing sociological study of consumption, Veblen used a concept of conspicuous consumption to describe consumption practices of luxury goods, which was wasteful and served as public display of social status, thereby treating consumption more as a signaling process than a fulfillment of needs. Last but not least, Karl Polanyi provided a classic statement on the creation of laissez–faire markets emphasizing not only the importance of state institutions in that process but also the role of liberal creed, or the ideas of economic liberalism, which came to dominate public discussions about how economy should be organized.

Culture in Markets

One major strand of research interrogating a relationship between culture and economy takes culture as the starting

point of analysis and locates it in various aspects of the economy, from production of culture to cultural industries to corporate cultures. We review these in turn.

The production of culture perspective has focused on the following six facets that influence the creation and dissemination of cultural objects (Peterson and Anand, 2004). First, law and regulation determine who controls what can be produced, or whether equal access to producers is assured. These regulations constrain or expand the range of symbolic elements produced. Second, technological innovation allows for communication and offers new openings for expression. Third, industry structure focuses upon processes of institutionalization, specifically at the field level. For instance, some cultural fields are dominated by very few, large firms, which offer a limited range of cultural products, whereas others have many, small firms offering a large range of objects. Fourth, differing organizational structures are variously suited to explore, support, create, and change different systems of symbolic production. Fifth, producers of culture have career trajectories and how their careers are situated within a field matters for their activity. Finally, the production of cultural objects needs to consider the market, mostly in the ways in which consumer tastes are channeled into market demand. Once new cultural goods markets are created, subsequent producers often tailor their creation to resemble already existing popular goods, also using measurement tools such as billboard charts for music or blockbuster ranking of movies that themselves structure the field of cultural production (Peterson and Anand, 2004).

A second way of investigating cultural objects in markets is to focus on cultural industries. Substantial work on this topic stemming from the humanities is linked to the critical theory of Adorno and Horkheimer and the incorporation of cultural industries into the commercial nexus of capitalism to function as ideological instruments with deceptive nature. Sociologist Paul Hirsch's (1972) reformulations reduce the politicized reading of the industries under question and instead focus upon the organizations, central to the processes of the creation, production, and supply of cultural items. Hirsch places emphasis on both inter- and intraorganizational coordination and competition, such as recruiting of new creators via 'contact men.' Ashley Mears' (2011) research on the models in the fashion industry, for instance, highlights the central role of brokers, or gatekeepers, who discover 'the right look,' develop it, and package it as a prized commodity. Patrik Aspers' (2010) study of the global high-fashion garment industry zeroes in on how order is maintained across the various interconnected retailer, producer, and credit market organization. He also suggests an analytical distinction between status markets and standard markets. In status markets, order depends on the identities of participating actors, such as global branded garment retailers, while in standard markets the quality of goods takes precedence.

Another take on culture in markets is to examine corporate cultures or organizational cultures more generally. Edgar Schein (1990: p. 111) defines organizational culture as "(1) a pattern of basic assumptions, (2) invented, discovered, or developed by a given group, (3) as it learns to cope with its problems of external adaptation and internal integration, (4) that has worked well enough to be considered valid and, therefore (5) is to be taught to new members as the (6) correct way to perceive, think, and feel in relation to those problems." Calvin Morrill (1995) shows how even the styles managers use to handle conflict in corporations is a part of corporate culture, which, Morrill finds, is heavily influenced by the hierarchical (or not) nature of the company's organizational structure. Given that scholarly research on corporate culture was accompanied by the focus of business practitioners on building strong cultures, Gideon Kunda's (2006) ethnography of an engineering division of a large American high-tech corporation provides a sobering call. Kunda examined managerial efforts to create corporate culture that promotes informal and flexible work environment to stimulate creativity and personal growth only to find that these pervasive efforts at culture building function as a form of control to which engineers responded with irony and distancing. Reflecting the observation of the increasingly important role of financial markets in contemporary world, several excellent studies also uncover the culture of Wall Street. Mitchell Abolafia's (1996) ethnography of Wall Street traders revealed the socially constructed nature of opportunism, hyperrationality, and heightened materialism, and the structural contexts that sustain them. A decade later, Karen Ho (2009) participant observed with investment bankers to expose how Wall Street culture fashions them to be "readily liquidated in the pursuit of stock price appreciation" as they, personally, "no longer benefit at all (or even suffer) when the corporation makes a profit" (p. 3).

Market Culture

Interested in the culture/economy interplay, a body of research performs a twist on a study of corporate culture to show how its economic logic of rationality, market and, most recently, finance has penetrated society as a whole, to become a prevalent way of how people make sense of their lives. George Ritzer (1993) developed the influential idea of the McDonaldization of society, arguing that the organizational innovations championed by the McDonalds corporation have come to define how contemporary society is run outside of the corporate world, and spilling over, for instance, to health care, education, tourism, and criminal justice. While the emphasis on efficiency, calculability, predictability, and control through automation seems to go hand in hand with Weberian rationalization and bureaucratization of the world, Ritzer, as did Weber, also warns of irrationality of rationality, especially its dehumanizing nature. Similarly interested in pinpointing the shifts in contemporary business culture, Luc Boltanski and Eve Chiapello (2007) examined French management texts from the 1960s and the 1990s to identify a 'new spirit of capitalism,' as labeled in the book's title. This new spirit advocates self-management and versatility in the workplace, and sees managers as coaches who get the workers to do what is needed by convincing them that the firm's interests are also their own interests. The normative order upon which this kind of capitalism rests is that of connections and networks, and a successful actor is one with plentiful contacts, flexibility, and mobility.

An increasingly vigorous line of inquiry has also been preoccupied with the contemporary rise of market fundamentalism, or a belief in "the moral superiority of organizing all

dimensions of social life according to market principles" (Somers and Block, 2005: p. 261). Margaret Somers and Fred Block (2005) coin the term 'ideational embeddedness' to explain how market fundamentalist ideas have radically transformed our knowledge culture. The concept is used to capture that the economy is embedded within the 'ideas, public narratives, and explanatory systems' that serve to create the necessary conditions for certain ways of organizing the economy to be normalized. The authors compare two cases of welfare revolutions in England and in the United States, in different historical periods, which were both preceded by the 'triumph of market fundamentalism as a new ideational authority,' but otherwise exemplified difference on every other significant explanatory factor. In their account, culture in the form of ideas is not only a part of the context in which economic processes are inserted but also a causal influence in constituting market outcomes.

In the wake of financial crises of 2008, scholars also turned to examining financialization as a major driver of societal transformation. Gerald Davis (2009) argues that finance has come to take center stage and reshaped how corporations and individuals behave. In this finance-centered system, the overriding concern of corporations is not productive activity but shareholder value, and individuals come to increasingly rely on financial markets, not employment in corporations, for security and wealth creation. Overall, this and similar research implies that pursuit of financial profit and self-interest is the order of the day. However, a cultural analysis of how 'economic interest' becomes a collective representation is actually lacking. Here, Lyn Spillman's (2012) work makes important headway by studying how economic interest is defined by American trade associations. Unlike typical characterizations, Spillman finds that both market and nonmarket relations are central to the business world. Far from being simply cutthroat, business associations develop shared ideas about collective interests and solidarity, and, overall, make business meaningful.

Cultural Embeddedness of Economic Organization and Production

Much of the understanding of organizational processes of production is influenced by sociological neoinstitutionalism, an early cultural perspective on organizations, which hones in on how people's actions are motivated by cultural norms, habit, and routine. Sociological neoinstitutionalism sees actors embedded in broad-scale contexts of meaning, which shape what is considered rational. Indeed, Meyer and Rowan (1977) argued that formal organizational structures are by-products of responding to commonly held 'myths' and engaging in ceremonial compliance. The neoinstitutional approach has given rise to an inquiry into how organizational fields are structured and a focus on institutional logics of action within industries that provide a guide to how decisions are made within companies. For instance, in her study of print industry, Patricia Thorton (2004) focused on how an institutional logic within the industry shifted from one focused on editorial issues to one focused on market issues. While before talk of profits was shunned and one went into business for the love of authors and books, in the 1980s, the institutional logic began to change with market channels and market positions becoming more of a concern and the basis on which executives were hired and promoted.

Referring to 'conceptions of control,' Fligstein (2001) captures a common understanding among economic actors about what works to make money. Conceptions of control are not just cognitive frameworks but they also define the relationships between producers, consumers, employees, managers, owners, and governments. Fligstein traces the change from the production conception to the sales and marketing conception and then to finance control. The late 1980s have seen a rise of the shareholder conception of control, which focused managerial attention on short-term profits and on making balance sheets look good to financial analysts, which would in turn be more likely to recommend the company stock and therefore enhance the shareholder value.

While studies highlighting the different cultural organization of the economy mostly focus on established markets, in an exemplary cultural analysis of economy, Richard Biernacki (1995) asks how the basic element of productive activity in capitalism, labor, is transformed into a commodity. Biernacki focuses on the diverging cultural definitions of labor as a commodity in Britain and Germany. He traces these understandings to on-the-ground practices by workers and employers in the wool textile mills during the nineteenth century, which were very similar economically and technologically but starkly different in terms of in-the-shop practices. Biernacki points to how the cultural definitions became codified in the political economy writings of Adam Smith and Karl Marx, which solidified them as distinct principles that would come to shape various outcomes, including how workers employed strike and protest, the kind of disciplinary techniques used in factories, and, in fact, susceptibility to Marxist analysis of exploitation.

Providing a cultural perspective on industrial policy formation, Frank Dobbin's (1994) now classic study of the railroad industry in the United States, France, and Britain in the nineteenth century showcases the elective affinity between political culture and economic organization in these countries. Dobbin argues that the principle of political order found in each country was translated into a principle of industrial order. He lays out how the nineteenth-century United States was organized as competing communities under a weak federal superstructure. In France, a strong central state dominated and coordinated private life, and in Britain, the emphasis was put on autonomous individuals with representation in Parliament. These distinct political cultures each left a mark on the economic organization of railroads in these three countries. In the United States, the railroad industrial policy situated economic sovereignty at first in community governments, and later in a market arbitrated by the federal government. In France, the central state oversaw industrial policy, while in Britain the policy placed sovereignty in individual firms.

Culture and Consumption

Sociological investigations of consumer markets have regularly yielded clear insight into how culture and economy intertwine. A classic perspective on the topic is that of Pierre Bourdieu (1984) and his discussion of taste and cultural capital.

Bourdieu has shown that the tastes that people have for different goods and activities, such as food, arts, or houses, are not a result of innate individualistic choices but depend on people's cultural capital, or proficiency in discerning what are considered to be more prestigious cultural goods or high-status signals. A focus on cultural capital suggests that tastes are socially conditioned. Moreover, consumption choices made are not merely to assert who one wants to be but rather to distinguish one from the others, given that consumption reflects a symbolic hierarchy determined and maintained by the dominant classes in society, whose interest is in keeping the social distance or, distinction, from other classes. For Bourdieu, taste is therefore not only determinant of consumption practices but also a social weapon for preserving power.

Viviana Zelizer (2005) develops a more meaning-driven, yet still relational, insight into the processes of culture and consumption within the economy. For Zelizer, the act of consumption in markets is not simply the end process of production and distribution, nor is it merely a momentary site of acquisition. Rather, consumption has within it "the negotiation of meaning, the transformation of relations in the course of economic interaction, and the social process of valuation itself" (p. 351). These processes highlight that the ties between producer, seller, and consumer must be investigated for their content; that these ties are constantly (re)negotiated, and not set in a power hierarchy; and that proper understandings of consumption must also focus on use and not only on acquisition of commodities.

In their review of the culture and consumption topic, Zukin and Maguire (2004) emphasize that large-scale changes in cultural understandings inform consumption practices, especially in relation to processes of individualization and collective identity. This links to an important theme of commodification. From a critical theory perspective, the spread of markets facilitates commodification because it makes everything available for sale, and therefore voids objects of any meaningful content, reducing them to one common denominator, market price. Cultural economic sociologists have countered this position on commodification, which reinforces the assumption that culture and economy are two separate spheres, whereby the introduction of monetization and marketization contaminates meaningful social relations. In contrast, culture and economy are intertwined and function as connected worlds rather than separate spheres. People use money to differentiate social relationships of various kinds and use different types of payments (compensation, gifts, or entitlements) to affirm, rather than corrupt, the meaning of a particular relation (Zelizer, 2010).

Likewise, recent work on exchange of human blood and organs, or other 'contested commodities' (Radin, 2001) asserts that the crux of the problem is not merely to allow or prevent the exposure to the market, but that market relations already coexist with their circulation in various ways. In fact, Kieran Healy (2006) shows that blood and organs are not given everywhere in the same way or to the same extent. That is because, Healy claims, donations do not simply depend on individual gestures of altruism but are structured by the contexts for donations. Specifically, procurement organizations play an important role in sustaining donation by providing structural opportunities to give and by producing cultural accounts of what giving means. Similarly, on examining the medical market for eggs and sperm, Rene Almeling (2011) finds that commodification of bodily goods does not result in uniform meanings, or lack thereof. Even if both men and women are paid for their donations, Almeling finds that clinics encourage sperm donors to think of the money they receive as payment for a job, while women are urged to regard egg donation in feminine terms, as a precious gift that one woman can bestow on another.

Cultural Understandings of Price and Value

A vigorous line of cultural economic sociology focuses on the cultural preconditions of pricing and value. Viviana Zelizer (2010) is the preeminent contributor to this scholarship with her historical analyses of the changing valuation of life and children. In *Pricing the Priceless Child*, a study of the changing economic value of children, Zelizer accounts for the cultural transformation from viewing children as economic contributors to family welfare, to increasing valuation of children as priceless, and sacred, and removed from the economic sphere. In her analysis of putting a price on life as in development of life insurance, Zelizer shows the opposite trend. She begins by describing a strong moral antagonism against life insurance in the nineteenth-century United States, because mixing the sacred value of human life with the profane sphere of money is seen as blasphemous, and these cultural obstacles prevent the market for life insurance to grow. Only when life insurance is reframed as a loving act of caretaking, and therefore aligned with the moral convictions of customers regarding the sacredness of life, can the market proliferate. Cheris Shun-ching Chan (2012) conducts a similar analysis by investigating how the market for life insurance developed in postsocialist China. Chan begins with a puzzle about how companies could sell life insurance in a country where death is a taboo subject, and explores how foreign and domestic companies negotiated local cultural resistance to facilitate market growth.

The cultural perspective on price has also been applied to esthetic markets. Olav Velthuis (2005) analyzed the strategies gallery owners use to price contemporary art in New York and Amsterdam. Far from reducing an esthetic object to a mere number, Velthuis reveals the moral significance of prices and meaning making that goes into their construction. He portrays gallery owners not as profit maximizers but as members and supporters of the art world who follow the conventions of their professional community and price art according to distinct kinds of narratives. A high price may indicate not only the quality of a work but also the identity and status of collectors along with that of the gallery and gallerists. Dealers might raise prices quickly for an artist who they consider to be a superstar, or more gradually in other cases, framing it as prudence in decision making. Velthuis reveals how prices operate as a symbolic system akin to language.

Frederick Wherry (2008) also emphasizes that prices are not culturally neutral but he interestingly points to an intersection of meaning attribution with identity and social location of the purchaser. For Wherry, prices are used to compare the qualities of differently situated people, those near to, as opposed to those far from, the mainstream. Based on this distance

dimension, consumers are characterized as foolish, faithful, frivolous, or frugal. These categories are consequential for societal assessments about what differently characterized consumers deserve. Such considerations preview increasing attention in the literature to the broadly defined notions of worth and value, its social construction, evaluative practices, and regimes of worth (Lamont, 2012). Jens Beckert and Patrik Aspers (2011) bring together a group of economic sociologists who tackle the question of how the worth of goods is established, building on the work of scholars like Charles Smith (1989) who pioneered the study on the social construction of value using auctions as his research site. Beckert and Aspers make a point that "for products to be sold in markets, customers must value them and assess their value in relation to other products. Firms must produce products and position them in the market where customers will consider them valuable. Financial investors must assess the value of assets through judgments of the opportunities and risks involved" (p. 3). Valuing goods is therefore central to all aspects of economic life. Examining the cultural underpinnings of valuation and evaluation helps hone in on how moral values and cultural practices influence economic value.

Culture, Development, and Globalization

Last but not least, culture and economy interplay has been explored at the macrolevel in an investigation of economic cultures that vary across nations. From a social psychological perspective, Geert Hofstede (2001) developed a theory of cultural dimensions, which identifies several dimensions of culture that influence work behavior (and other outcomes). These dimensions include power distance (from low to high), individualism vs collectivism, tolerance or avoidance of uncertainty and ambiguity, masculinity vs femininity, and long- vs short-term orientation. Hofstede developed his model from data compiled in a worldwide survey of employee values in International Business Machines' subsidiaries across the world in the 1960s and 1970s, and his work has been widely influential in social psychology and business and management studies that examine cross-national differences on various economy-related outcomes.

From a constructivist perspective, sociologists have argued that different national contexts are distinguished by different cultural logics of action. For instance, Nicole Biggart and Mauro Guillen (1999) compared auto industry in four nations, South Korean, Taiwan, Spain, and Argentina to propose that economic development depends on how a country's institutionalized patterns of authority and organization – which legitimize certain actors and certain relationships among those actors – are linked to the opportunities in a global market. Different actors, such as states, business networks, small businesses, or families, will be considered as more or less legitimate players in different countries, and this and other collective understanding and cultural practices will contribute to different organizing logics of economy. The power of institutional logic of actions is such that "economic and managerial practices and actions not consistent with the institutional logic of society, even if they are abstractly 'better' or 'more efficient,' are not readily recognized and incorporated" (p. 726). Therefore, the strategies for capital accumulation or any other economic policy that succeed in one country may not be a good fit with the preexisting organization of another country. As such, the course of development and the policies that enable it should build on the institutionalized logics rather than uniform global strategies.

With a different take on the role of culture for development, Nina Bandelj and Frederick Wherry (2011) propose an inquiry into the 'cultural wealth of nations' that exposes how firms located in particular places find themselves at an advantage relative to firms in other places by virtue of the symbolic resources they have at their disposal. These symbolic resources include collective narratives, reputations, status, and ideas. A variety of state and private actors are involved in creating narratives, staging social performances, and managing a country's reputations in a global market so as to, for instance, attract world tourists or inflows of foreign investment and therefore further national economic development. Authors also warn that conversion of cultural capital to economic capital at the level of countries is not a seamless process, and one size does not fit all. Nevertheless, creating and deploying cultural wealth, not only industrial progress, represents a viable strategy of economic prosperity for developing countries in a globalized world.

When considering globalization and the interplay of culture and economy, Ritzer (2003: pp. 193–195) makes a distinction between glocalization and grobalization, where grobalization denotes the 'imperialistic ambitions' of corporations and other entities to see their power and profits *grow* at a global scale, resulting in 'proliferation of nothing,' or 'social forms devoid of substantive content.' This contrasts with glocalization, or 'the interpenetration of global and local, resulting in unique outcomes in different geographic areas,' and proliferation of 'something.' To understand global culture and economy, we also need to take into account a vast literature on world society (Meyer et al., 1997), which claims that, over a century, the world has constituted a single world polity with a corresponding world culture, carried by international nongovernmental organizations promoting universalism, individualism, rational progress, and world citizenship (Boli and Thomas, 1997). While the majority of research in this field examines environmental, educational, and political outcomes, a handful of studies showcase the promise of this type of inquiry for understanding economic phenomena. For example, Henisz et al. (2005) examine how world society theory can help us understand why countries differ in the extent to which they adopt market-oriented reforms and find that international pressures of coercion, normative emulation, and competitive mimicry strongly influence domestic economic policy. More recently, Lim and Tsutsui (2012) found that ties to world culture strongly predicted whether corporations adopt corporate social responsibility initiatives.

Economics and Economic Theory as Cultural Forms

In the final section, we discuss research that intimately couples the economy and culture by understanding the discipline of economics and economic theory as cultural forms. In a major

statement, Marion Fourcade (2009) studies economics as a discipline and profession in the United States, Britain, and France to understand how national cultures inform the understanding of economics as an object of analysis as well as economists as a category of knowledge. Fourcade brings attention to the differing ways in which economists conceptualize problems and practices in economic functioning across the three national contexts. She situates her arguments within three levels of understanding: the political bases of economic order, the cultural bases of institutional orders, and knowledge production dependence on local context. The study is also insightful about the difference in the kind of economic policies favored by economists in different nations. In Britain, the discipline of economics developed out of a political culture that valued small, cohesive societies that exerted much influence over the genesis of national policy. In France, economics was shaped by the administrative exercise of public power. In the United States, it was the dominance of market institutions that contributed to the success of economists in influencing society and policy.

Economists are also increasingly seen as cultural agents who theorize the markets they then subsequently come to create. Donald MacKenzie and Yuval Milo (2003) showed how the now-famous Black-Scholes model for pricing options became incorporated into actual prices of options on the Chicago Board of Options Exchange floor. This work is exemplary of the research in 'performativity' of economics, which, following Michel Callon's (1998) influential statement, seeks to show how economic theory *creates* the reality in its image, as opposed to simply describing – more or less accurately – an external reality that is not affected by the theory. Often the focus of this research, firmly grounded in the social studies of finance, is the role of sociotechnical tools in performing financial markets.

By considering economic objects (including markets, economists and economic theory) as cultural objects, an analysis of the interplay between culture and economy is a far cry from common assumptions that the two are separate spheres with little in common. As we hoped to make evident in this brief review, a growing and vigorous strand of scholarship continually counters the long-held views that some economic phenomena are more cultural than others, and that some more 'standard' economic processes, such as those located in corporations, markets, and finance, leave little or no room for culture. Indeed, relatively recently, cultural economic sociology that envisions culture and economy as mutually constitutive domains has proliferated in a field that before long was dominated by structural analyses. Vigorous interest in the constitutive role of culture in economy points to its promise in answering some vexing questions presented to us during turbulent economic times.

Culture and Emotion

Batja Mesquita, Nathalie Vissers, and Jozefien De Leersnyder, Center for Social and Cultural Psychology, University of Leuven, Leuven, Belgium

© 2015 Elsevier Ltd. All rights reserved.

This article is a revision of the previous edition article by S. Kitayama, volume 5, pp. 3134–3139, © 2001, Elsevier Ltd.

Abstract

Research on culture and emotion has moved beyond the once central nature–nurture. Evidence suggests that there are universal *constituents* of emotions – the 'emotional potential' – rather than universal *emotions*. Furthermore, the emotional constituents are assembled in culture-specific ways that are meaningful and predictable, resulting in systematic cultural differences in 'emotional practices' (i.e., people's actual emotional lives). Whereas emotions are not universal, the underlying rule of emotional life is: Culturally adaptive emotions are more prevalent and intense. After reviewing empirical evidence for each of these claims, we outline some of the future directions for research on culture and emotion.

Introduction

In the history of emotion research, the pendulum has swung repeatedly between universalist and social constructionist positions on emotions (Kitayama, last edition of the Encyclopedia). Universalist approaches emphasized the evolutionary origin of emotions, and considered them as biologically given and invariant. In contrast, social constructionist approaches emphasized nurture, focusing on the cultural processes shaping emotions, and assuming that emotions were cross-culturally different. Variability in the phenomena was thus taken to be informative about the constitutive processes: The degree of variability of emotion was conflated with their origin.

More recently, the recognition that culture itself is perhaps the greatest evolutionary advantage of all for the human species has shed a different light on the nature–nurture debate. Plasticity – or cross-cultural variability – of emotions in ways that fit, and are adaptive to, the cultural context may itself be an evolutionary advantage. Most scientists would agree that human beings have some universal potential for emotions, but also that, across cultures, emotions are configured in very different, and uniquely adaptive, ways. The questions driving research on culture and emotion have become more nuanced, and focus on the ways the building blocks of emotional life are configured in culture-specific ways.

In the next section we first define the main concepts: culture and emotion. A summary of research on the universality of emotions will follow. The remainder of this review will focus on research that systematically approaches cultural differences in emotions.

Culture and Emotion: Definitions

Culture

Culture is the human-made part of our environment. It forms our reality, and provides the goals, norms, and values that guide our behavior. Culture is not just a varnished layer of meaning onto a core of reality, but rather it shapes reality itself; it includes the ways in which our daily lives are structured, in particular the habitual and normative ways of being, and having interactions and relationships. Culture importantly defines the context of adaptation for each and every individual.

The meanings and practices of self and relationships, or 'cultural models' vary widely between cultures, as illustrated by the contrast between European American and East Asian cultural models. According to middle-class European American models of self and relating, an individual should be both independent and autonomous. To achieve these goals, self-esteem and individual control are important conditions to the American way of independence, as they afford individuals to influence (others in) the world to achieve what is best for themselves. In contrast, the dominant goals of the self in most East Asian cultural contexts are interdependence, relatedness, and harmony, which can be achieved by adjusting to others. In Japan, adjustment is thought to be facilitated by self-criticism, because this leads the way to self-improvements.

Cultural models do not only exist in the head of individuals, but also 'in the world.' The American practice of complimenting and rewarding each other for every level of achievement is an example, and so are the politeness rules and the sessions of critical self-reflection in Japan. Therefore, cultural models invariantly define an individual's context of adaptation, even if not every individual engages in these models in exactly the same way.

Emotion

Emotions are first, and foremost, intentions to act (e.g., Frijda, 2007). Emotions are not just subjective feelings, but having an emotion also means a commitment to act. To take anger as an example: The experience of anger implies an attitude of nonacceptance, and the assessment that others will, or at the very least should, accommodate your wishes, goals, and values. Emotions thus serve important functions in relationships; according to some, the adaptive advantage of emotions is precisely that they help to coordinate and regulate relationships (e.g., Keltner and Haidt, 1999). Moreover, emotions communicate these intentions to act to others: Anger communicates that the person is not likely to accept the current state-of-affairs.

If emotions are commitments to act, it can be seen why they have cultural meaning. Some acts are consistent with the cultural models of self and relationships, whereas others are inconsistent. The philosopher Robert Solomon tried to explain why anger might be so much more rare among the Utku, a group of Inuit living in the Arctic Canada, than in America (2002: 139): Anger "is as basic to American culture as an emotion can be" because it fits with the notion of entitlement and control. On the other hand, anger is quite absent in the lives of the Utku Inuits, because it is incompatible with their 'rational' worldview and includes unjustifiable judgments and structures. As a result, anger plays no socially acceptable role in their society (Solomon, 2002).

In Pursuit of Universal Building Blocks: The Emotion Potential

Much of the psychological research on culture and emotion focuses on the *potential* of emotions: that is, the human capacity to have certain emotions. This research is less concerned with the actual emotions people in different countries have, the so-called emotion *practice*, than with people's ability for these emotions. In the next section, we will discuss two schools of thought on emotional potential that both have inspired the research on culture and emotion.

Universal Emotions

One school of thought that has inspired much of the psychological research on culture and emotions assumes that certain emotions, so-called 'basic emotions,' are universal building blocks of emotional life (e.g., Ekman, 1992). The underlying idea is that basic emotions have evolved for their adaptive value in dealing with fundamental life tasks: Emotions prepare for actions that were particularly useful for recurrent life tasks in our evolutionary past. For instance, anger protects us from exploitation. Most basic emotion theories also assume that each basic emotion (1) corresponds to one particular adaptive value, and (2) is characterized by its own set of unique features (antecedent events, facial and vocal expressions, physiology).

Cross-cultural research designed to prove the universality of basic emotions relied on the observable features characteristic of the basic emotions: facial and vocal expressions, and physiological response patterns.

Universal Emotions? Evidence from Studies on Expressive Behavior

Paul Ekman's research on facial recognition of emotions is a showcase example of the paradigm most commonly used (e.g., Ekman and Friesen, 1969). Ekman and colleagues showed pictures of faces to participants from a large range of different cultures (among them illiterate, remote cultures), and asked them to identify the emotion in the face by choosing one emotion out of a list. Even people from very different, non-Western cultures were able to correctly identify a number of emotions above chance. This was seen as proof for the universality of basic emotions. Similar studies have been reported for vocal expression, and yield comparable results (e.g., Sauter et al., 2010).

To be fair, basic emotion theorists did not deny differences in the *practice* of emotional expression. In fact, basic emotion theorists postulated the notion of 'display rules' to account for these differences. Display rules are the "cultural norms that dictate the management and modification of emotional displays depending on social circumstances" (Ekman and Friesen, 1969). Display rules have been found to differ across cultures. For instance, Matsumoto et al. (2008) asked participants from 32 different countries what they *should do* if they felt each of seven emotions (anger, contempt, disgust, fear, happiness, sadness, and surprise) on a scale ranging from emotion expression to nonexpression or masking (i.e., hide emotion with smile). The strongest differences in display rules were found for high-activation positive emotions, with the level of individualism of a country predicting the extent to which it was considered good to express positive emotions. (In Section Emotional Frequency and Intensity we will return to the finding that individualist cultures seem to value high-activation positive emotions more than collectivist cultures.) There is little research linking display rules to actual expression. Display rules are expected to influence expressive practices, but not the recognition of emotion.

Facial and vocal recognition studies, though designed to find universality, also yielded important and persistent cultural differences in emotions. Granted, people across cultures identified certain facial and vocal expressions *above chance*, but percentages of correct identification largely varied (ranging from about 20 to 95%), depending on both the culture and the emotion considered. Moreover, a systematic in-group advantage occurred, meaning that facial expressions were always best recognized by people from the same culture (for a meta-analysis see Elfenbein and Ambady, 2002). Recognition of facial expressions was also improved for perceivers who had been exposed to the culture of the sender, or whose culture was similar to the sender's culture.

The notion of a biological hard-wired 'language of emotions,' in the form of universal facial and vocal expressions, has itself been challenged. In a series of ingenious experiments, Rachel Jack and her colleagues compared the mental representations of facial expressions of six basic emotions (the same six that were included in the studies by Paul Ekman and colleagues) with a technique called 'reverse correlation.' This technique starts from gray-scale pictures of race-, gender-, and emotion-neutral faces that are covered with a random pattern of black and white dots (white noise). In each trial, one pixel is varied, after which participants choose one emotion out of the six basic emotions identified by Ekman and colleagues; they also have the option to answer 'I don't know.' By aggregating the facial stimuli of all trials that are classified as a certain emotion, the researchers established the mental representation of facial expressions associated with the emotion. In research comparing Western European and East Asian samples, Jack found the representations of facial expressions to be different: the eyebrow and mouth regions were important in Western representations, whereas the eye region, particularly the gaze direction, was important in East Asian representations of facial expressions (Jack et al., 2011). Therefore, the idea of universal facial emotion signals has been challenged by neuropsychological research.

Using a number of behavioral tasks, Maria Gendron and her colleagues also challenged the idea of universal vocal and facial signals of emotions (Gendron et al., 2014 a,b). In their experiments, they tested if facial and vocal expressions would be recognized without providing 'basic emotion' words by people from an isolated culture. Himba participants, an ethnic group living in the remote parts of northwestern Namibia, freely labeled, sorted, or matched emotional expressions. Throughout different tasks, the Himba differentiated between positive and negative emotional expressions, and to some extent between high and low activation expressions, but they did not clearly distinguish between discrete emotions. The studies did not provide support for the idea of a universal language for basic emotions: If anything, people universally distinguish between vocal and facial expressions of positive and negative affect.

Universal Emotions? Evidence from Studies on Physiological Responses

Other research aimed at showing cross-cultural similarity in the patterns of physiological responses associated with several basic emotions (e.g., Levenson et al., 1992). Reliable measures of physiological responding in emotion are hard to obtain, because strong emotions are difficult to induce in the lab, and outside of the laboratory many factors confound measures of emotional responding. Therefore, the scientists relied on a directed facial action task, a task that was built on the assumption that a particular set of different emotion features (facial expression, physiological responding) is linked invariantly to one emotion. In this task, participants' physiological responses were measured (e.g., heart rate, skin conductance, respiration) while they followed instructions to move specific facial muscles in ways that characterize one of the basic emotions. For instance, the instructions for a disgust expression were to (1) wrinkle your nose while keeping your mouth open, (2) pull down your lower lip, and (3) move your tongue forward without sticking it out. A study comparing North American male college students, and men from a remote illiterate culture – the Minangkabau, a relationship-oriented matriarchal society on Western Sumatra, Indonesia – yielded largely similar patterns of physiological response upon the same directed facial action (Levenson et al., 1992). Based on this finding, the authors concluded universality in physiological response patterns associated with the basic emotions.

This interpretation has been challenged. First, it is not clear what the cross-cultural similarity in physiological responses means, given that several meta-reviews of research in exclusively Western cultural settings have failed to find distinctive physiological patterns of presumed basic emotions (see, e.g., Cacioppo et al., 1993). Second, even if the directed action task yielded similarities in physiological responses, it also yielded a very significant difference between the American and the Minangkabau groups: In contrast to the American participants, the Minangkabau did not report *feeling* the matching emotion. One explanation for this difference was suggested by Hazel Markus and Shinobu Kitayama, two prominent cultural psychologists: The Minangkabau conceive of emotions as social events, and did not infer an emotional experience in the context of the directed action task, where the respondents were by themselves (Markus and Kitayama, 1994). In sum, evidence for basic emotions from physiological research is weak at best.

Basic Emotions as Universal Building Blocks

Evidence from research on the measurable features of emotion – expressive behavior and physiological responses – fails to support the basic emotion view. Note that the basic emotions tradition has not generated any research on the subjective experience of emotion; the latter was taken to be unanalyzable. In the next section, we discuss the componential view on emotions that has produced many cross-cultural studies on emotional experience.

Universal Components

Another school of thought, componential theory, focuses on the components of emotional experience (e.g., Frijda, 2007). Componential theory proposes that emotional experience can be further analyzed in terms of more basic and universal emotional components. In addition, the relationship between these components and the emotional experience is universal (Mesquita and Ellsworth, 2001): *If* the same set of components occur cross-culturally, the same emotional experiences will too.

Cross-cultural research in this area has mainly focused on the two core components of emotional experience: appraisals and action readiness. Appraisal refers to the individual's assessment of the meaning and relevance of a certain situation to the individual, and is usually represented as the pattern of outcomes on several dimensions of meaning (e.g., to what extent was the situation either pleasant or unpleasant, either conducive or harmful to self-esteem). Action readiness refers to the motivated goal in the (social) situation, and is usually represented as an urge to act in certain ways (e.g., to what extent did you feel the urge to withdraw from the situation, aggress toward the other person), or as a change in the direction of the relationship with the (social) environment (e.g., moving away, moving against). Appraisal and action readiness have been thought to constitute emotional experience as well as organize all the other components.

The Universal Component–Emotion Link

The paradigm of most componential research consists of self-report studies. Participants report real-life events in which they have experienced a given emotion (and its translations in different cultures), and then rate their experience in that same situation with respect to several emotion components: appraisal dimensions and/or action readiness modes. It is important to mention that the dimensions of meaning (appraisal, action readiness) have typically been theoretically derived by researchers from Western cultures, and that little effort has been made to establish for each culture what the most central dimensions of meaning are.

The largest cross-cultural study using this paradigm was conducted by Klaus Scherer and his colleagues, and included students from 37 different countries from all over the world (Scherer, 1997a,b; ISEAR database by Scherer and Wallbott, see http://www.affective-sciences.org/researchmaterial). The study investigates to what extent the dimensions of appraisal and action readiness mapped onto several emotions (mostly of the

kind that Ekman and colleagues had studied) in cross-culturally similar ways. It yielded substantial support for cross-cultural similarity: A similar core of appraisals and action readiness was associated with each of the seven emotions included. The study yielded some differences in the link between components and emotions as well, to which we will return (Section Emotional Frequency and Intensity).

Evidence for cross-cultural similarities in the set of appraisal (or action readiness) dimensions comes from a slightly different approach to the same data. Several researchers have examined whether the same set of component dimensions cross-culturally discriminated between different emotions, at least to some extent. They found this to be partly the case: Component dimensions accounted at the most for 40% of the variance in emotions, and this held true across different cultures.

Whereas the same set of components meaningfully distinguished between emotions in different cultures, it did not completely account for the differentiation between emotions (40% is still a long way from 100%). Moreover, across cultures, the degree to which individual appraisal and action readiness dimensions (e.g., pleasantness) discriminated between emotions was different.

Differences may have been underestimated, because all studies started from equivalent emotion words in different languages, whose selection may have been based on similarities in the associated meanings to begin with. Thus, finding similarity in the components associated with these emotion words may have merely confirmed the accuracy of translation. To our knowledge, not very many studies have shown a link between emotional components and other features of emotion. An exception is work by Anna Tcherkassof who conducted a cross-cultural recognition study among Burkina Faso and French participants, in which participants identified the action readiness associated with facial expressions. The study was inspired by Nico Frijda's theory of facial expression as the initial manifestation of action readiness. This study found that the rates of recognition, based on action readiness, did not significantly differ between cultures, and were also no worse than recognition rates obtained by studies in which participants judge the emotion expressed by a face (Tcherkassof and de Suremain, 2005). In addition to suggesting that action readiness is an important dimension of emotional meaning, because it differentiates between facial expressions, the findings also show that action readiness is no worse candidate for a universal building block than the basic emotions that were proposed by Ekman.

Understanding Indigenous Emotions from Universal Components

The use of the componential approach is perhaps better illustrated by the way it renders unfamiliar emotions comprehensible. An example comes from a study on *amae*, which is considered a 'culturally unique' emotion for the Japanese culture (Niiya et al., 2006). Amae is defined as the ability to depend and presume upon another's love or bask in another's indulgence, and cannot be translated by any one English emotion word. However, Niiya and colleagues found that North American participants responded with similar appraisals to *amae*-eliciting vignettes (i.e., a friend makes an inappropriate request for help) as were found in Japanese. Therefore, *amae* was rendered comprehensible by studying its associated components. The componential approach has provided a language to compare emotional experience cross-culturally in terms of both the personal relevance of the situation (appraisal) and the actions afforded (action readiness).

Conclusion

Appraisal and action readiness dimensions make unfamiliar emotions comprehensible, which is proof of their usefulness. Yet, a reason to be critical is that much of the research has adopted preconceived dimensions of appraisal and action readiness. Whereas some of these dimensions have a logic appeal, there is no evidence that these dimensions are the ones that are cross-culturally the most salient elements of meaning. Consistently, the combined dimensions adopted in research explain no more than about 40% of the variance in emotions, and the importance of a given dimension differs across cultures.

Toward an Understanding of Cultural Variations in Emotion: the Emotion Practice

Despite marked differences, the commonality between different approaches searching for universals (basic emotions, componential approaches) is that they lack a theory to predict or explain cultural differences in emotions. In this section, we will review research that shows the profound role of culture in the daily emotional experiences of people. The research reviewed generally assumes that emotions, or emotion components, that are 'helpful' or 'functional' in a culture will be more frequent or intense (see for detailed overviews Mesquita, 2003; Mesquita and Leu, 2007). Below, we will illustrate several lines of research that explain variation in emotional practice from central cultural differences.

Emotional Frequency and Intensity

Cultural differences exist with regard to the most frequent and intense emotions. These differences are systematic and meaningful. In one series of studies, Shinobu Kitayama and his colleagues compared emotional experience in the United States and Japan, using a culture-sensitive, bottom-up approach (e.g., Kitayama et al., 2000; Kitayama et al., 2006).

In a first study, participants from both cultures rated the similarity between different emotion words representing not only common American emotion words, but also common Japanese emotion words (and their translations). An emotional space defined by the dimensions of valence (positive, negative) and social engagement (socially engaging, disengaging) emerged from these ratings. Socially engaging emotions, such as friendliness (positive) and shame (negative), reinforce and underline the relationship. In contrast, socially disengaging emotions such as pride (positive) and anger (negative) reinforce and underline the autonomy (and superiority) of the individual.

Many previous studies have established valence as an important dimension of differentiation between emotions, but

the finding of social engagement as a dimension defining of emotions is new. Therefore, the first point to note is that the inclusion of the most common Japanese emotion words (and their translations in English) yielded a different structure of meaning than previous research that started from Western emotion words only. Social engagement is an obvious candidate for a dimension of appraisal that has not been included in most appraisal theories (but see research on the emotional dimension of *Power* or *Dominance* – which may partially overlap with the dimension of Social Engagement – e.g., Fontaine et al., 2013).

Subsequent studies by Kitayama and his colleagues yielded support for the idea that the emotions that are most helpful in coordinating the relationships in a given cultural context are experienced most frequently and intensely. These studies found that socially disengaging emotions (e.g., pride, anger) were most frequent and intense in European American cultural contexts where good relationships are defined by the autonomy and independence between individuals. In contrast, socially disengaging emotions (e.g., pride, anger) were more frequent and intense in East Asian cultural contexts where good relationships are defined by the relatedness and interdependence of the partners. Emotions that fit the cultural models are both more frequent and intense; therefore, there are cultural differences in emotional practice.

Not only the frequency and intensity of emotions as such but also of individual emotional components can be predicted from cultural models (Mesquita and Leu, 2007). For example, agency appraisals (responsibility, control) have been found in many different studies to be more frequent in Western, independent cultures where an individual's agency is deemed more central and important than in nonwestern interdependent cultures. Naturally, the occurrence of certain appraisals may also account for the occurrence of the matching emotions: Claiming responsibility would go with pride (Imada and Ellsworth, 2011)

The Role of Situations

One reason for cultural differences in emotional practice may be that, across cultures, people encounter different types of situations. For example, it is possible that people in some cultures simply receive more compliments than in other cultures, and thus experience more pride. Several studies have suggested that the situations that are likely to occur within a culture are far from random: There will be more opportunities for situations that elicit emotions that are consistent with the prevailing cultural models.

In a series of comparative survey studies from our own lab, we predicted the frequency of a set of emotion-eliciting situations from (1) their potential to elicit a given emotion and (2) the value of that emotion within the particular culture (Boiger et al., 2013; Boiger et al., 2014). The research focused on shame and anger. In a comparison between the United States and Japan, the researchers expected that anger situations in the United States would be afforded, because anger is a hallmark of autonomy and independence. In contrast, anger was expected to be avoided in Japan, where it violates the interdependent model of relatedness and harmony. Conversely, shame was expected to be condoned in Japan, where it is consistent with the ideal of self-reflection and self-improvement, whereas it was expected to be condemned in the United States, because it undermines positive self-regard, which is a cornerstone of the US cultural model. Consistent with these expectations, the researchers found that the higher the potency of a situation to elicit (high intensity) anger, the higher its frequency was rated in the United States, and the lower in Japan; conversely, the higher the potency of a situation to elicit (high intensity) shame, the lower its rated frequency in the United States, and the higher in Japan. More refined analyses of the differences between cultures may thus serve to predict which situations are culturally promoted, and which situations are avoided.

Research by Jeanne Tsai and her colleagues has found that individuals seek out those emotions that afford important cultural tasks: influencing in the United States, and adjusting in East Asian cultures. Consistently, European Americans 'ideally wanted to feel' more high-activation positive states than East Asians, and East Asians 'ideally wanted to feel' more low-activation positive emotional states than European Americans (e.g., Tsai et al., 2006). In one within-culture experimental study, Tsai and colleagues found clear evidence that ideal emotions were associated with the task at hand. American participants valued high-arousal positive states more after being assigned the task to influence others, and low-arousal positive states after they were asked to adjust to others (i.e., suppress personal needs and change their own behaviors to meet others' needs; Tsai et al., 2007).

Across studies, people select situations that will lead to the culturally valued emotions. When given a choice, European Americans in an experimental setting consistently selected artifacts (e.g., CDs) that elicited high-arousal over those eliciting low-arousal activities, whereas the reverse was true for East Asians (Tsai et al., 2007: Study 4). Societal statistics confirmed these experimental results: North Americans consistently preferred recreative drugs, leisure activities, and music preferences that elicited high-arousal positive emotions over those eliciting low-arousal positive emotions, whereas there was a preference for activities that elicit low-arousal positive emotions in East Asian societies. Moreover, within a North American sample, individual differences in ideal affect in fact predicted preferential activities (leisure time, drugs, types of vacations) in ways that mirrored cultural differences between North Americans and East Asians (Tsai, 2007).

The Role of Concern Salience

Why people evaluate a situation as pleasant or unpleasant differs in ways that more or less follow from the important cultural models of independence and interdependence. In experience sampling research, Mesquita and Karasawa (2002) found that in an American group of college students, events were rated as pleasant (or, to the contrary, unpleasant) to the extent they were relevant to independent concerns, such as self-esteem and being in control. In contrast, pleasantness in a Japanese group was judged as much by independent as by interdependent concerns; examples of the latter are feelings of closeness and other people's (im)moral behavior.

Consistently, European Americans and Asian Americans showed enhanced emotional reactivity when the dominant aspects of their self-concept were activated (Chentsova-Dutton and Tsai, 2010). In experimental research, priming *individual* aspects of the self led to greater levels of positive emotions and smiling in European Americans, whereas priming of *relational* aspects of the self was associated with greater emotional reactivity in Asian Americans. Emotions are more intense when they are about culturally focal concerns (including culturally central aspects of the self).

Recent research from our own lab has found that culturally focal concerns do not only affect the intensity of emotions, but also the *types* of emotions (De Leersnyder et al., submitted). Belgian and Turkish respondents indicated how relevant emotional situations were to both self-focused values (e.g., personal success) and other-focused values (e.g., loyalty). Across studies using different methods, we found that situations that self-focused values elicited more disengaging emotions (pride, anger), whereas other-focused values elicited more engaging emotions (friendliness, shame). In addition, we found that the frequency with which these values were perceived as relevant to Belgian students' emotional situations exactly mirrored young Belgians' value hierarchy (i.e., most important values as 'guiding principles in people's life'), as obtained from a national representative sample by the European Social Survey (ESS round5; Norwegian Social Science Data Services, 2012; De Leersnyder and Mesquita, in preparation). Together, these findings suggest that cultural differences in the salience of certain values may be one of the reasons for differences in the rates and intensity of engaging and disengaging emotions.

Feeling Culturally Appropriate Emotions Is Rewarding

If emotions of people from different cultures are different, then, by the same token, emotions of people within one culture should converge. In fact, recent research has suggested that the emotional experiences of immigrants over time grow more similar to the emotions of people from the new culture; and that intergroup contact promotes this emotional acculturation (see, e.g., De Leersnyder et al., 2011).

We have suggested that cultural differences in emotional phenomena can be understood from their functionality to the culture. What is the evidence that this is so? Several studies have found evidence that fitting in, or having the same emotions as most others in your culture, is beneficial; or conversely, that not having the emotions that are culturally aspired can be harmful. For instance, subjective well-being (good feelings) was more closely related to engaging positive emotions (e.g., friendly feelings, respect) in Japan, but to disengaging emotions (e.g., pride, superiority) in the United States (Kitayama et al., 2006). In more recent research from our own lab, we found that emotional fit with the cultural average predicted relational well-being; this was true in three different cultures: the United States, Belgium, and Turkey (De Leersnyder et al., 2014). Finally, Tsai et al. (2007) found that depression, the opposite of well-being, was predicted by the differences between culturally ideal emotions and a person's actual emotions. In the Chinese sample the relative absence of *low*-activation positive emotions predicted depression, but in the American sample it was the relative absence of *high*-activation positive emotions. In sum, individuals have better outcomes when they are more similar to others in their culture.

Emerging Trends

Research on culture and emotion has moved beyond the dichotomous question of whether emotions are nature or nurture, and has started to investigate more nuanced and detailed questions. It is clear that some of the building blocks of emotions may be universal in ways that make it possible to largely comprehend emotional lives in other cultures, even if they are very different from our own. It is equally clear that the emotional lives of people in different cultures vary in systematic, predictable, and meaningful ways. Moreover, the cultural differences are dictated by, what could be considered, universal rules: People have emotions that are helpful in their own cultural context. There is plasticity in emotions, even in later life: When immigrants move to a new cultural context, their emotions slowly adapt.

Whereas our knowledge of cultural similarities and differences in emotions has become much more detailed and systematic, insight into the processes that lead to cross-culturally different emotional lives is still very limited. These processes constitute the challenge of future research on culture and emotion. Two emerging trends will be discussed below.

Emerging Trends: Emotions as Momentary Constructions

Emotions are increasingly seen as constructions in the moment (Barrett, 2006; Mesquita and Boiger, 2014), rather than pre-established entities, with the implication that an emotion concept may be constructed differently across both contexts and cultures. In this regard, the finding from the Directed Action Task that American men and Minangkabau men did not construct their facial expressions to signal a subjective feeling of emotion is interesting (Levenson et al., 1992). The finding suggests that the construction of an emotion is not just bottom-up, as in constituted by appraisals, action readiness, and self-perceived facial expression, but also top-down, guided by the culture's lay theory of emotion. The idea is consistent with psychological constructivist theories of emotion (e.g., Barrett, 2006).

Another consequence of this view that emotions are constructed in the moment is that emotions are differently constituted at different moments in time (even within one culture). To do justice to the complex nature of emotional experience, we recently conducted a study that established the variety of patterns of appraisal and action readiness that were associated with anger and shame in three different cultures: United States, Belgium, and Japan. In each of these cultures, we observed the same three varieties of patterns for each emotion, but not at the same rates. The dominant patterns (of appraisals and action readiness) differed by culture, such that the culture of the participant was accurately predicted in 40–50% of the cases (Boiger et al., in preparation).

Emerging Trends: Emotions as Relational Constructs

A second trend emerging in (cultural) research on emotions is to study emotion in their social and relational context (Butler, 2011; Mesquita, 2010; Mesquita and Boiger, 2014). In particular, researchers have started to study how this social context helps to create and regulate the fit of emotions with cultural norms, and also, in the long run, how it helps to develop culturally adaptive emotional dispositions. The best examples come from developmental psychology. In one cross-cultural study in Germany and Japan, Trommsdorff and Kornadt (2003) compared the emotional interactions between mothers and their children when the child had disobeyed. They found that German mothers readily attributed blame to their children, therefore reacting with anger. An escalation of anger and resistance would ensue. The conflict ended unresolved, leaving both the mother and the child angry and hurt. A very different interaction pattern was observed in Japanese mother–child dyads: Japanese mothers were more likely to interpret disobedience empathetically ("the child is just a child, is too much absorbed in playing, is too tired"; Trommsdorff and Kornadt, 2003: 296), and to react in an accommodating manner. The Japanese mothers remained friendly, though they kept insisting that the child obeyed. Even though repeated failure of the child to give in would get them disappointed, they avoided putting relational harmony in jeopardy. In the end, both parties started making partial concessions, thus protecting the desired feeling of oneness (ittaikan), and reinstating harmony. Both interactions were constructed based on cultural models of self and relationship. German mother–child interaction accomplished the cultural model of independence and autonomy by influencing and asserting oneself, whereas Japanese interactions accomplished harmony and relatedness by adjustment and empathy.

The mother–child interactions had long-term effects on children's relational patterns: In both cultures, the escalation of interactions in early childhood negatively predicted the level of empathy-based altruism and positively predicted aggression 9 years later. These interaction patterns can, therefore, be understood as necessary socialization experiences: Independent German children learn to assert themselves, whereas interdependent Japanese children learn to accommodate and to place relational harmony over individual desires. This example vividly shows how social context and emotions are intricately interwoven in ways that are consistent with the prevalent cultural meanings.

This example shows how engagement in culturally particular social interactions and relationships directly shapes emotions (cf. Kitayama et al., 2009). Therefore, culture's influence on emotions is not merely mediated by beliefs (e.g., Matsumoto, 1990), but rather afforded and scaffolded by social interactions as they evolve in a particular culture. It is the future of culture and emotion research to further probe the ways in which culture is produced and reproduced in emotional interactions, a process known as the 'microgenesis of culture' (Kashima, 2008).

Culture and Institutional Logics

Patricia H Thornton, Duke University, Durham, NC, USA

Abstract

This article defines key assumptions of the institutional logics perspective (ILP) particular to the relationship between institutional logics and culture. It discusses central debates in the sociology of culture to highlight affinities between theoretical issues in the ILP and the sociology of culture. Implications are discussed for advances in the sociology of organizations and culture and research in the substantive domains of morality, justification, and symbolic management.

The institutional logics perspective (ILP) is an emerging and rapidly developing research area in organization and management theory (Thornton et al., 2012). Even though it is a meta-theory of cultural systems and micro- and macrobehavior, it remains a relatively untapped framework in the study of culture. This article considers debates among cultural sociologists on the internalization and objectified status of culture and describes the ILP with the goal of suggesting affinities and potential synergies between the two domains.

To lay the ground work for this discussion, this article is organized first to describe and highlight key concepts and mechanisms in the ILP and then to delineate schools and dividing issues in cultural theory. A key theme in discussing these two perspectives is to link discussion of the issues of internalization/externalization in cultural sociology to micro-foundations and exteriority in the ILP. In short the debate in cultural sociology revolves around how much cultural content is attributable to mechanisms internal to the individual as distinct from being external in society. Contemporary cultural sociologists suggest relinquishing the fixation on the internal mechanisms of socialization and cognitive attributions and focusing outside the person and toward the external world in which the individual is embedded (Lizardo and Strand, 2010). The ILP is a scaffolding to understand both the interiority and exteriority of culture. It is the exteriority mechanisms that separate the institutional logic perspective from the bulk of prior neo-institutional theory and provide it with a theory of agency. The sociology of culture work has promised to elaborate and advance these theoretical issues. This article closes with a discussion of the implications for research on the issues of morality, justification, and symbolic management.

The Institutional Logics Perspective

The ILP presents theory and methods for understanding how to embed persons and organizations in their institutional environments (society). It is a multilevel meta-theory useful in studying the role of culture in both traditional and secular societies. "Institutional logics are the socially constructed patterns of cultural symbols and material practices, assumptions, values, beliefs, and rules by which individuals and organizations produce and reproduce their material subsistence, organize time and space, and provide meaning to their social reality" (Thornton and Ocasio, 1999: p. 804). According to this perspective, societies can be conceptualized as an interinstitutional system of institutional orders. In theory these orders are cultural subsystems in which culture is more likely to cohere within than across orders, for example, the family, community, religion, market, state, professions, and the corporation. This framework provides a comparative heuristic to theorize and measure culture as both an independent and a dependent variable. Cultural symbols and practices can emerge, change, and remain stable depending on the levels of contradiction and contestation in logics across institutional orders and how these logics become activated and thus available and accessible to individuals and organizations to use and manipulate.

A key distinction of the ILP from that of Bourdieu's (1990) work is that it does not necessarily see cultural processes as embedded in power struggles and material inequality. The ILP is agnostic on the question of inequality, which in theory could produce stability and cooperation, rather than struggle. For example, material inequality could be relatively culturally acceptable as in the case of the British respecting and preserving their monarchy; whereas citizens of other nations may view such reverence to an extreme standard of inequality with contempt. This example highlights that power struggles are culturally contingent in explaining the coherence of societies.

Stinchcombe (2002: p. 429) has commented on how to theorize the question of power in ways that are compatible with the ILP. He argued that, "an understanding of culture is needed to define the meaning of power and competition and that in building theory this question presents a causal ordering problem. If power is theorized as a first-order construct in explaining institutional change, independently of culture, two problems need to be addressed. First, power is created in the course of action; it does not occur prior to the action that it explains. Second, the decision to use power as an intentional strategic choice may be problematic because it is not always possible for actors to know the cultural framing or menus of available options in advance of any action" (Thornton et al., 2012: p. 65).

It should be stressed that the mental contents of the institutional orders are of both individual and collective origin, hence developmental over time. This contrasts and departs from Durkheim's notion of 'religious phenomena' and Weber's understanding of 'value spheres' in which the cognitive contents were not open to revision in light of the progress of individuals' experience. According to the ILP, actor's practical experience is a source and a building block of the institutional

orders and logics, just as institutional orders and logics have some hand in shaping the minds of individuals and the behavior of organizations through both symbolic and material mechanisms.

There is a significant amount of empirical research to support the development of the ILP (see Thornton and Ocasio, 2008 and Thornton et al., 2012, for reviews). Thornton and Ocasio's (1999) integration of the meso- and macrolevels of culture demonstrated how institutional logics affect organizational actors' attention in defining a problem and recognizing a solution. They showed how a shift in attention to different institutional logics changed the determinants of executive succession in the US higher education publishing industry. Companion articles expanded the scope conditions to other organization decisions (Thornton, 2001, 2002). Using a combination of qualitative and quantitative methods and models, this research partitioned the analysis of cultural meaning from structural effects (see Thornton, 2004: Chapter 8). For example, it showed the number of corporate acquisitions (structural) remained the same under the era of a professional logic (controlled by editors) as compared to a market logic (controlled by corporate headquarters), but the meaning (cultural) of and consequences of acquisition activity changed.

Thornton et al. (2012) discuss how each institutional order is made up of categorical elements that form the categorical elements of institutional content, for example, the sources of legitimacy, norms, values, and practices, which can be expressed in symbolic and material form. Ideal types are used to illustrate society as an interinstitutional system, locating the seven institutional orders of societies on the X-axis (family, community, religion, market, state, professions, and the corporation) and the categorical elements of institutional content on the Y-axis. In theory the interactions between the categorical elements on the Y-axis and the institutional orders on the X-axis constitute an institutional logic. (There are many illustrative examples of these matrices used for analytic purposes in different substantive contexts, see in particular Thornton, 2004; Thornton et al., 2005, 2012; Thornton and Ocasio, 2008.) A key difference between an institutional logic and an institutional order is that logics can be constituted from categorical elements of different institutional orders (hybrids). That is, there is a partial autonomy and near-decomposibility of the interinstitutional system (Thornton et al., 2012: p. 59). This can result from the activities of institutional entrepreneurs and from structural overlap and event sequencing (Thornton et al., 2005). Institutional orders and logics stem from such institutionalizing activities over the course of history.

The ILP assumes the interpretation of the Y-axis elements differ depending on the observational lens – from which X-axes is the camera focused – the interaction effects are represented in the cells of the matrix. Axis or axes may be the referent because singular or multiple institutional orders may be influencing an individual or an organization. In theory ILP does not assume a priori the number of order(s) or logic(s) that are likely to influence behavior in a particular context or whether or not a single logic is more dominant than another or that multiple logics are necessarily operative. In theory no one institutional order has causal primacy a priori, though the origin and prevalence of institutional orders is temporally and contextually dependent, for example, the family is an older institution than the state and religion and family logics in general are more influential in traditional societies. Tracey (2012: p. 118) comments it is a nonissue to frame a contribution to the literature on the basis of the number of institutional logics operating in a given context.

The comparative anchoring of cultural symbols and material practices to the root institutional orders is important in winnowing all of societies' potential influences so as to zoom in on the underlying or more salient meanings of cultural content. For example, family values and practices will differ from market values and practices. The degree of conflict and interdependence among the categorical elements of the institutional orders also differs, for example, the values and practices of the market and the family are likely more opposing whereas those of the state and the professions are likely more interdependent, particularly if the analysis is of Western societies. For example, if an individual's or an organization's environment is more steeped in family values and practices rather than market values and practices, the interpretation of symbols and the enactment of practices is likely to differ. These type of effects have been well demonstrated at the organizational level in qualitative and quantitative large sample controlled studies and are beginning to be demonstrated at the individual-society levels of analysis in experimental research (Glaser et al., 2012).

The microfoundations of institutional logics are less well developed and this is a growth area where new work is emerging and needs to consider not just organization- but individual-level actors. This work draws on attentional theories rooted in cognitive and social psychological research (dynamic constructivism) and the Carnegie School. Dynamic constructivism theory was developed to explain which culture individuals rely on for their behavior. Institutional logics focus the attention of actors through cultural embeddedness, activating a social actor's situated identities, goals, and action schemas for decision making, sense making, and mobilization (Ocasio, 1997, 2011; see Thornton et al., 2012: Chapter 4). Nigam and Ocasio (2010) examined the cross-level effects of how critical events activate and make institutional logics available and accessible to actors for sense making. Thornton et al. (2012) illustrate how entrepreneurs discover new ideas and solve problems in legitimating and justifying their new organizations by switching and recombining institutional logics. When entrepreneurs switch institutional logics they are shifting the sources of analogies and referent categories (think bits of culture) by which people can understand and practice their innovation (Lounsbury and Glynn, 2001; Durand et al., 2013). Examining the creation of banks, Almandoz (2012) reported that founding teams that had functional backgrounds (internal) associated with a community logic, as distinct from a market logic, had higher founding rates and lower rates of founding team dissolution (material practice). Rather than focusing on the divisive debate on internal versus external mechanisms, this research advances theory by measuring dualities of cultural mechanisms.

To solve the problem of a lack of agency in a structural neo-institutional theory (DiMaggio and Powell, 1983), it was necessary to show that individual interests and power were

not institution (culture) free; that interests and power had both a material and symbolic aspect in which actors' interests could be understood independently of actors' understandings (Thornton et al., 2012: p. 41). Meyer and Rowan (1977: p. 45) set the stage for this advance in developing the concept of loose coupling in organizations and their claim that the "building blocks for organizations come to be littered around the societal landscape: it takes only a little entrepreneurial energy to assemble them into a structure." This exteriority of institutions from organizational actors, or in the parlance of cultural sociology, externalization, allowed the development of the ILP as a levels theory of cultural institutions and paved the way to cut loose institutional theory from its overly structural bondage. "This is an important issue because a theory of institutions needs to recognize that individuals and organizations are embedded in social structures, yet also explain how they are externalized or partially autonomous, allowing them to construct institutions socially" (Thornton et al., 2012: p. 72). Loose coupling assumes that internalization can occur through both cognition and practice – it permits identification with symbols rather than learning through practice. Emerging work is theorizing and testing these ideas at the individual-society levels of analysis (Klyver and Thornton, 2014).

Debate in Cultural Sociology

A vibrant debate in cultural theory is raging between the classical and the embodied theorists. Overall the central issue stems from the question of how much culture is internalized in the person (i.e., stored through cognitive mechanisms) versus how much culture is objectified in external publicly accessible formats (i.e., stored in language, vocabularies of motive, discourse, accounts, justifications, rituals, media, artifacts, codes, categories, institutions, and other ways of framing experience) (Lizardo, 2012).

Classical theory focuses on the derivation of individual-level cognition from abstract cultural patterns external to the mind, conceiving of culture as external and organized as an emergent order of symbolic systems (Durkheim, 2005; Parsons, 1972, 1968; Zerubavel, 1999; Alexander, 2003; DiMaggio, 1997; DiMaggio et al., 2013). Variants of the classical approach differ in their attention to cultural content, the functionalists focusing more on norms and values and the phenomenologists on cognition. According to the classic view, meaning derives from collective symbolic categories learned through culture. This requires specifying the mechanisms explaining how an individual's mental representations are linked to material or mnemonically available symbolic systems to create sense making for the individual (Douglas, 1986). In theory persons need symbolic cultural structures to be able to generalize across sensory events and to characterize their present experience so that it can be used to understand future experiences.

But, how do sensory events as a singular example of a larger class of entities get typified in order to be meaningful to the person? Parsons (1964, 1972) argued this occurs because people through their familiarity with a system of generalized cultural symbols learn to typify their experience, i.e., through cognitive socialization, which is a metaphorical learning process for the transmission of culture, for example, in the family environment. Thus, for an individual to be socialized, something external or social has to be converted into something internal or personal (see Lizardo, in this volume).

In contrast, the embodied approach views culture as tightly coupled to peoples' practical action grounded in their relations to the material environment (Lizardo, 2012; Lakoff and Johnson, 1999; Gallese and Lakoff, 2005). It draws its ideas from the intersections of cognitive science, cultural and cognitive anthropology, developmental psychology, robotics, and the philosophy of mind. Embodied views of cognition challenge classical perspectives to explain (1) how internalization occurs and (2) how people use cultural symbols to derive meaning.

In his contribution, Culture, Cognition, and Embodiment Lizardo argues that the problem the classical view raises for embodied theorists is that the mechanisms of internalization are not well specified and that existing knowledge structures may not stem from experience. It is implausible that individuals are subject to such a massive systemic process of socialization into the symbolic cultural system. Classical theorists push back arguing that accounting for only sensory events is tantamount to empiricism, which results in irrationalism. Classical theorists do not deny that sensory stimulation exists, but argue it alone is not a sufficient condition for individuals to derive meaning (see Lizardo's, in this volume, for the elaborated argument).

Embodied theorists reject that a person's cognitive experience is constituted via the internalization of external symbols. Internalization requires the transmission of cultural content from person to person and from the environment to person. It requires strong assumptions about socialization processes through which individuals internalize norms and values and other forms of cultural information. In Lizardo and Strand's (2010: p. 208) words it requires belief "in some predetermined set of internalized cultural objects which are mysteriously downloaded through unseen, undertheorized, underspecified mechanisms from an unseen, undertheorized, underspecified cultural ether." People just can't remember and keep straight all the relevant logical linkages that would need to be connected to make the theory credible (Martin, 2010). It is not analytically parallel to argue that mental experience can be symbolic in the same sense that external cultural symbols are symbolic.

Alternatively, embodied theorists argue that the phenomenological contents of mental experience are directly meaningful and do not require symbolic translation. The mind cannot be thought of as a repository of symbols. Meaning derives from repeated experience that is supported by neural structures that made the experience possible in the first place (Barsalou, 1999). Embodied theorists cite historical evidence that meaning was possible in prelinguistic societies and hence cultural symbols do not need to exist to produce meaningful mental experiences.

In embodied approaches to cognition, cultural symbols do not constitute mental experience, a notion rooted in structuralism, or make sense of it, a legacy from phenomenology, but instead are used to exploit mental experience. "Cultural symbols do not mean anything, instead they serve as prompts for persons to engage in individual or collective acts of meaning construction" (see Lizardo's, in this volume: p. 0110). The potential for meaning construction is based in experience

(Bourdieu, 1990), it is not based on the internal access to cultural symbols. Cultural symbols are necessary but only to coordinate access to delimited chunks of conceptual knowledge in action (see Lizardo's, in this volume: p. 0110).

Swidler (1986, 2001) is credited with igniting the debate between the 'classical' and the 'embodied' approaches by criticizing the reigning Parsonian functionalist view with the introduction of the tool kit perspective. She argued that "culture does not influence how individuals and groups organize action via enduring psychological proclivities implanted in individuals by their socialization. Instead, publicly available meanings facilitate certain patterns of action, making them readily available, while discouraging others" (Swidler, 1986: p. 283). What actors imbibe from the social environment is a set of heuristics, hunches, and shallow practical skills that effectively enable people to interact with the external institutionalized elements such as norms, values, and other cognitive schemata to generate coherent behavior (Swidler, 2003). The key finding motivating tool kit theory is that if actors supposedly internalized culture, then why are they unable to produce a coherent regurgitation of their actions. Thus, Swidler's argument shifts much of actors' cognitive activity to external institutions (Lizardo and Strand, 2010). She argues that persons engage in improvisation, using their cultural competencies to draw from a tool kit of partly internal and partly externalized forms of cultural content. Swidler's tool kit idea initially lacked systematically propositional and empirical support, which more generally plagued cultural sociology (DiMaggio, 1990). However, the tool kit idea gained tremendous appeal particularly in the wake of DiMaggio (1997, 2002: p. 275) arguing its resonance with the findings of controlled studies in social and cognitive psychology.

Bourdieu's (1990, 2000) practice theory argues that both the cognitive and institutional are externalized. By externalized I refer to Zucker's (1977) classic experiment that confirmed culture as social knowledge; once institutionalized culture exists as a fact and therefore part of objective reality, which can be transmitted directly without being internalized by individuals and transmitted through them to other individuals and organizations. However, practice theory emphasizes that individuals are to a significant degree influenced by having a history of recurrent experiences in institutional environments. It is the match between actors' 'socialized' dispositions and external institutional environments that produces coherence in social action and differentiates Bourdieu's practice theory from the 'poverty of cognition,' of tool kit theory. Practice theory argues to look for an explanation of the system of actors in culture through sequences of choices made at the level of practice.

From my reading of their work, two well-known culture scholars, Vaisey (2009) and DiMaggio (1997) have taken a middle road in the classic/embodied debate and in elaborating on Swidler's argument on the externalization of culture. DiMaggio (1997, 2002: p. 276) engages the duality of both internalization and externalization of culture by arguing that persons "store information, opinion, and attitudes organized through schemata." Schemata are images of objects, actions, or events, and the linkages among these represented in stereotyped behavioral routines. Social schemata provide frameworks that people use to interpret new information. People have access to these schemata in varying degrees depending on how central they are to a person's self-image, emotional character, as well as their salience, frequency, and recency with which the environment has activated them (D'Andrade, 1992). "Schemata are themselves organized into relatively independent domains among which there are not necessarily homologic relations" (DiMaggio, 2002: p. 276).

Psychologists have learned that people have two different types of cognition, characterized broadly as deliberate and automatic (Metcalfe and Michel, 1999). DiMaggio (2002) suggests this is evidence of Parsons' belief that orientations to action are variable, which is contrary to ethnomethodology and Bourdieu's (1990) practice theory. DiMaggio (2002) points out that schematically organized knowledge that is internalized by persons is affected by domain independence – that is different classes of life situations (practice), for example, those related to work and family. It is domain independence, which makes people a lot less consistent than expected. Personality resides in interactions between behavioral dispositions and social situations (Mischel and Shoda, 1995). Hence, the lesson here is that cultural effects lie in the interactions of subgroup domain and personal disposition – rather than values, groups may have predilections to act in certain ways in specific situations. DiMaggio et al.'s (2013) recent use of topic models is an attempt to analyze data about the environment of cultural representations with which the person's mental structure (network of schema) interacts (see DiMaggio, 2002: pp. 278–279 for a discussion of the psychological research supporting these ideas).

Vaisey (2009) bridged the duality of socialization and tool kit theories by developing dual process theory to illustrate how culture is a repository of values that motivate individuals' intentions; these values are transmitted to individuals via socialization from institutions such as family and religion (Parsons, 1964). Culture is also a loosely coupled repertoire of rhetorical tools that individuals use to rationalize, justify, and make sense of their life situations and choices – justifications being a form of symbolic management.

Lizardo's view (in this volume) on procedural theory is inspired from practice theory (Strauss and Quinn, 1997; Bourdieu, 2000) and ethnomethodology (Garfinkel, 1967). According to procedural theory, persons are not cognitively capable of internalizing (e.g., learning, memorizing, introjecting) cultural content or symbolic representations (Martin, 2010). Culture can only be embodied as skill and only through practice and experience. With procedural theory Lizardo (2012: p. 82) sets out to disband the presumption that persons carry in their heads cultural content. Citing Zaller (1992) and Barsalou (1987) Lizardo argued, "there is little evidence in the social and cognitive sciences that such structured mental representations as attitudes, opinions, or concepts exist as stored entities in long term memory." Persons can become encultured without internalizing any cultural content. Culture is not embodied in people's heads but in cultural competences embodied in procedures and cultural performances. The building blocks of cultural content are practice-based and experiential – culture is constructed in real time by persons when they encounter situations that socially require this content (Lizardo, 2012).

Procedural theory is consistent with practice theory in that culture is not represented in the heads of social actors in the form of linguistically coded beliefs, nor is it a logically integrated system of beliefs. Lizardo argues, for example, that objectifying

culture is antithetical to the embodiment of culture in persons for several reasons: first, there cannot be a dialectic of internalization/externalization (Berger and Luckman, 1967) – these concepts must be analytically distinct. Second, if cultural embodiment requires direct experience, how then does one explain the existence of codes when persons lack the capacity to use and understand them? Third, there is empirical evidence that artifacts are discovered after the embodied competencies that produced them have disappeared. Last, institutions survive, yet the capacity to apply rules and categories inherent in the institutions has atrophied (Lizardo, 2012).

In sum, tool kit, practice, and procedural theory argue that to attribute too much internal cultural content to the person is likely to run into explanatory difficulties. The solution is to shift much of the cognitive workings that previous approaches inscribed in the mental makeup of the person to outside the person and toward the external world of institutions in which the person is embedded (Lizardo and Strand, 2010: p. 223).

Considering Both Cultural Sociology and Institutional Logics

The ILP has a history of rigorous research specifying the interaction effects between the institutional environment (culture) and organizations (Haveman and Rao, 1997; Thornton and Ocasio, 1999; Marquis and Lounsbury, 2007), but is only beginning to focus on the microfoundations and the relationship between individuals and culture. Incorporating insights discussed from the culture research can help advance the focus on interaction effects at the microlevel. As a meta-theory the ILP has the potential to address the issues of both the classic and embodied theories. One can understand the embodied theorists' argument that people in preliterate societies did not need to derive meaning through internalization in their heads. However, the empirical research in institutional theory suggests that there have been many institutional worker bees since cave man and it is well-known that institutions "take on a life of their own" (Selznick, 1957). Similarly, the functional life of an institutional logic can wax and wane over historical time (Dunn and Jones, 2010).

This article has spanned levels of analysis with perhaps an uncomfortable broad brush shifting of discussion across organizations and individuals. Nonetheless, the punch line is that with the exception of the work of DiMaggio and Vaisey, the sociology of culture debate appears an overly bifurcated representation of the role of culture and its effects on individual cognition and behavior. My own read of the debate is as DiMaggio (1997, 2002) suggests, the weight of sociological and psychological empirical evidence from controlled studies is on the side of exploring the interaction effects between the symbolic and the material, the internal and the external, and the cognitive and experiential. Below I discuss potential topical areas to begin this work.

Morality

Altruism, sympathy for others, the understanding of others' goals, and other aspects of morality is underdeveloped in the ILP. Current theory in the ILP assumes the influences of morality vary across the seven institutional orders. Just as the institutional orders of family and religion influence moral values and practices, so does the market logic, for example, in Hayek's (1944) notions of individualism and self-responsibility that underlie self-regulating free markets. The current typology of the ILP is a representation of the main institutions of societies (cultural subsystems) and it was derived from a reading of Weber's (1978) Economy and Society as well as classic and contemporary organization and management and social science theory and empirical research. This scope allows theorizing the varied influences of self-interest and understanding the empirical observation that winners of legitimacy struggles and justification contests are not always the most moral or worthy or concerned for the common good. Given that contemporary moral thought is much less coherent than it once was (Massengill, 2008), the ILP is suited to theorize and measure the heterogeneity of cultural context that informs different variants of moral thought.

Excepting Greenwood et al. (2010), which shows that corporate management practices were tempered by religion and family logics in the face of market pressures, there is a lack of logics research invoking religion even though it has been a foundry for individual, organizational, and collective identity and behavior (Tracey, 2012). With the exception of Western Europe, much of the world continues to be religious (P.L. Berger, 2001). Tracey (2012) points to micro- and macro-avenues for exploring the moral scope of institutional logics through his critical review of religion, connecting it to behavioral ethics, identity formation, and change and interdependency in the interinstitutional system. Parboteeah et al. (2009) found a negative association between religion and work ethic norms in countries characterized by 'state religion,' where the government regulates religion by appointing religious leaders and collecting taxes for religious organizations. In the institutional logics parlance this is when the boundaries of the logics of religion and state are weak and interdependent. Pearce et al. (2010) found religion related to entrepreneurial orientation and organizational performance. Weaver and Agle (2002: p. 77) found when religious role expectations are 'internalized as a religious self-identity,' it can be a determinant of individual ethical behavior, depending on the importance of religion to identity and whether individuals are intrinsically motivated to participate in religion. Stout and Cormode's (1998) study is of interest in its focus on how the logic of religion is connected to other institutional orders such as the state, the market, and the family.

Justification and Symbolic Management

Because the ILP assumes that what is considered legitimate changes depending upon the cultural context, it has the potential to examine how culture is more than motivating action – it justifies action. It can be used to understand how legitimacy is comparatively negotiated, evaluated, and resolved. The qualitative work on justification struggles spearheaded by the French pragmatists, Boltanski and Thévenot (1991), and research developed by the US cultural sociologists exemplify the approach called justification (Vaisey, 2009).

Conceptualizing the seven institutional orders (family, community, religion, market, state, professions, and the corporation) to represent different repertoires of justification that individuals and organizations use to make sense of and rationalize their choices – is a short step from its current use as a framework for understanding the sources of legitimacy as motivation. For example, one could compare differences in the meaning of case vignettes by switching institutional orders, which suggests different justifications for the same behavior.

Institutional Logics as Culture

In "Markets from Culture …" Thornton (2004) treats culture as an independent variable, to interpret organizational decision-making changes based on how different institutional logics focus actors attention. Institutional logics as culture can be applied to a myriad of unexplored topics such as how objects, spaces, and technologies shape and frame social relations. Hollerer et al. (2013) show the importance of visual material elements of communication in translation. Moreover, culture can be viewed as a dependent variable. Research in the ILP illustrates how alternative meanings of cultural symbols and material practices, as influenced by different institutional orders, wane and wax over time and context.

The major contemporary theoretical schools in cultural, cognitive, and organization theory differ in how they focus on and characterize cultural content – whether it stems from the internalization of tightly coupled values or the externalization of loosely coupled justifications based on categories and codes (Vaisey, 2009; Hannan et al., 2007). The ILP is a scaffolding for fleshing out different parts of a larger story of cultural content – a way to keep the big picture in mind.

In sum, while the ILP is less developed at the microlevel than the literature in both classic and embodied cultural sociology, the two schools of thought share affinities with the ILP in a number of respects of which I highlight three in particular. First, institutional logics are comprised of both the symbolic and the material aspects of actors' culture and experience. Second, as a meta-theory the ILP is the subject of some other theory, those theories could be, for example, socialization, tool kit, practice, dual process, and or procedural theories. Third, the ILP is a method to help specify the internal and external scaffolding of culture and its associated micro- and macrolevel mechanisms. It does not privilege any one cultural context or actor theory. Given these assumptions, the time is ripe for exploiting the affinities between institutional logics and cultural theory.

Culture and Networks

Abstract

Changing conceptions within the sociology of culture and in the research community of social network analysts have led to the development of a new specialty area, research at the intersection of culture and networks. The new research entails a rethinking both of the kinds of actors and actions that takes place in networks, and of the connections among actors that are relevant. This article emphasizes conversations, objections, and ongoing concerns within this evolving research specialty as well as research accomplishments.

The concept of *culture* has traditionally connoted large-scale phenomena such as national character, the ultimate values of a society, shared stores of knowledge, and people's total way of life. The concept of *social networks* has traditionally referred to the patterning of connections among actors, with analytical power deriving from an emphasis on the formal modeling of system and structure. Over the past 30 years, but especially during the past decade, each of these concepts has undergone significant reorientation. Moreover, the topic of 'culture and networks' has emerged as a research specialty in its own right and became the subject of a number of overviews, reviews, and orienting statements (DiMaggio, 2011; Fuhse and Mützel, 2011; Mische, 2011; Mohr and Rawlings, 2010; Pachucki and Breiger, 2010) in the wake of widely influential calls a decade earlier for the production of new models and syntheses of social structural and cultural analysis (DiMaggio, 1992; Emirbayer and Goodwin, 1994). The focus of this article is to describe the main contours of these changes as well as the most noteworthy of the emerging research questions and approaches guiding the contemporary work.

Culture and Networks as a Developing Research Specialty

We review recent changes in emphasis in the study of both culture and social networks that has led to the new research specialty at their intersection.

Culture

A diverse set of influential anthropologists and sociologists writing in the 1970s pointed the way toward a more activist view of culture than the one that had long dominated these disciplines and which posited an autonomous sphere of clearly known values that were imprinted inside the heads of all members of a society. As against theories of Saussure, Durkheim, Kluckhohn, and Parsons, the new analysts – grouped under the rubric of 'practice theorists' by Ortner (1994) – included Clifford Geertz, Marshall Sahlins, Pierre Bourdieu, and Anthony Giddens. A major contribution of Geertz was his insistence on studying culture from the actor's point of view; however, his most radical theoretical move, as Ortner (1994: p. 129) has emphasized, was to argue that culture is not something locked inside people's heads, but rather is embodied in public symbols. For Geertz, "man is an animal suspended in webs of significance he himself has spun," and Geertz took culture to be those webs (Geertz, 1973: p. 5). Moreover, as argued most sharply by Giddens, the study of practice is not antagonistic to the study of systems or structures, but rather a necessary complement to it (Ortner, 1994: pp. 146–147).

Beginning with Geertz's definition of culture, but seeking to change the emphasis from interpretation to explanation, Ann Swidler (1986) theorized a model alternative to the traditional conception, according to which, rather than values providing the ultimate ends that actors seek, actors' cultivated skills, styles, and habits, bundled together as repertoires or 'tool kits,' provide robust linkages between culture and action. Symbols, stories, rituals, and worldviews constitute repertoires that people use actively to construct diverse strategies of action. The term 'strategy' connoted for Swidler, not a consciously defined plan to attain a goal, but rather a general way of organizing action. Thus, lines of action might for some purposes take shape as trading in a market, and in other instances might refer to gaining resources from existing networks of relatives and friends. This insight provides an opening to subsequent findings on the conditions for within-network exchanges (DiMaggio and Louch, 1998). Many currents of contemporary research in cultural sociology have been strongly influenced by this concept of culture operating at a more local level than in the traditional formulation and emphasizing culture as providing repertoires of capacities and practices.

Networks

Many commentators (including Pachucki and Breiger, 2010) draw attention to the extent to which the 1970s breakthroughs in network modeling seemed explicitly to reject culture as any part of an explanation for network patterning. This is too simplistic a view on two accounts.

Important currents of network analysis have defined themselves, much as is apparent in Swidler's work, as a move from unwarranted abstraction and toward the analysis of contextualized and concrete structures. Harrison White and his collaborators on blockmodeling indeed did explicitly reject rooting network analysis in 'a harmony among abstract norms and values' (a reference to the sociology of Talcott Parsons, which was also the main point of departure for Swidler's

cultural toolkits approach), and in doing so they endeavored to redefine the classic concepts of role and position 'so that they apply to concrete, observable interactions' (White et al., 1976: pp. 731, 733). While there are today, and have always been, analytical movements within network analysis to study abstract 'structure,' in the singular (well epitomized by the search for laws that apply to 'all networks,' as reviewed popularly in Barabási, 2002), White and collaborators set out to ground network analysis in the study of 'structures' in the plural – different networks that might be associated with different strategies or lines of action. Indeed, even a single network, a small college fraternity, was shown to evolve within its first 15 weeks from one pattern (that of in-groups) toward a distinctively different one emphasizing hierarchy and increasingly negative ties aimed at an out-group (White et al., 1976: p. 764).

The second way in which blockmodeling (search for macrostructure) across multiple networks (sets of connections among social actors, with a different network defined for each of several distinct types of relationship, such as affect and economic exchanges) admits an opening to culture is in putting forward an explicit approach to the meaning of ties, albeit an approach that was firmly grounded in structuralism. For Boorman and White (1976), two networks have the same meaning if and only if they have identical pattern of incidence, either at the individual actor level or (more usually) at the macrolevel. Thus, for example, if the network reporting enemies of enemies of each actor (such that there is a tie from each person i to person j if j is an enemy of an enemy of i) produces a pattern of ties among actors that is identical to the network of friendship among the same actors (a tie from i to j in the friendship network indicating that j is a friend of i), then by Boorman and White's (1976) *axiom of quality*, the analyst has a warrant to conclude that, in the context studied, enemies of enemies are friends, and precisely in this way the two networks are said to share the same meaning.

Culture and Networks

The emphases on concrete structure and on structure-as-meaning thus provided some openings toward culture, but the 1970s approaches to social network analysis were justly criticized by Brint (1992) for marginalizing culture, yet smuggling it back in to provide an interpretation of blocks of actors who, for example, might be characterized as the "top dogs … [who] remain largely ignorant of most lesser mortals" (White et al., 1976: p. 749), a phrase expressive of cultural distinctions that the network analysts did not however interpret on a cultural plane. Symbolic interactionists (most recently and astutely, Salvini, 2010) urge a reconceptualization of social networks as emergent effects of the complex interlinking of situated social interactions, never entirely stable, and informing an analysis of how actors work through constraints to formulate courses of action for social interactions.

A significant spur to the creation of joint interest in networks and culture arose in the 1990s with the formation of a working group on 'measurement and meaning' within the 5-year-old Section on the Sociology of Culture of the American Sociological Association. Paul DiMaggio, John Mohr, and Ann Swidler were among the active participants. Meanwhile, Harrison White published *Identity and Control* in 1992 (a largely new second edition appeared in 2008), upending existing network theory and proclaiming that a social network is a network of meanings (see Mische, 2011; Pachucki and Breiger, 2010: pp. 208–209, for expanded discussion). The journal *Poetics*, an interdisciplinary journal of theoretical and empirical research on culture, the media and the arts, began from the 1990s onward to be a vibrant center for research at the intersection of social networks and culture. Within the past decade, the annual meeting of social network analysts has begun to feature sessions specifically on networks and culture, and models of social influence processes have been brought to bear on studying the reception of texts (Childress and Friedkin, 2012).

Significant Research Questions and Controversies

We will address the principal research issues at the interface of culture and networks under two main rubrics, relating respectively to the kinds of actors, and the kinds of connections or ties, that constitute social networks from the perspective of cultural analysis.

What Kinds of Actors Inhabit Social Networks?

Rational vs Practical Network Actors

Much traditional social network analysis models the actors or 'nodes' of network diagrams as black boxes and lacking in purpose, agency, or motivation. DiMaggio (1992: p. 120) referred to it as the effort to create a structural sociology that is culture-free, and urged the formulation of a suitable theory of action and of the cognitive status of role definitions, action scripts, and typifications. Moreover, DiMaggio portrayed the early blockmodeling work as well as the continuing tradition in network analysis as smuggling in such frameworks implicitly. In contrast to both the Parsonsian and the rational choice traditions, DiMaggio (1992: p. 121) saw these forms of network analysis as sharing with ethnomethodology a radical realism focused on concrete social relations, and a view of culture as "a mystifying system of post hoc accounts used by actors to normalize or explain interaction rather than to shape it." Sketching a contrast between rational action and practical action, the latter consisting of a mix of cognitive psychology, social constructionism, the Carnegie School of organizational behavior research, and a conception of practical reason akin to Bourdieu's, DiMaggio (1992: p. 138) urged network theorists to develop the practical actor model, with its emphasis on what actors do not know about social structure and the shortcuts they develop to operate under conditions of uncertainty. Somers (1998: p. 766–767) put forward a 'relational realist and pragmatist ontology' taking as the basic units of social analysis neither individuals nor structural wholes, but rather the relational processes of interaction between and among identities.

Inner-Directed and Tradition-Directed vs Other-Directed Network Actors

Recently, there has arisen something of a counterrevolution against what its proponents see as excessive social constructivism on the part of analysts of the culture–network interface.

With reference to David Riesman's (1950) distinction among action orientations, it is possible that (explicit or, more usually, implicit) models of network actors have tended to portray them as 'other-directed,' implying a muted form of individuality according to which actors who inhabit social networks are incessantly oriented only to the actions of others, rather than holding a firm course fixed by a person's internal gyroscope or moral compass ('inner-directed' actors) or to an orientation emphasizing the value of community norms and a sense of taken for granted purpose ('tradition-directed'). C. Smith (2010: p. 340, italics in original) brings to bear a philosophical standpoint positing that a "*natural drive toward a sustained and thriving personal life broadly … generates*" social structure. Writing on 'network structuralism's missing persons,' he insists that norms cannot be dismissed as causally insignificant. While sympathetic to the network structuralists' rejection of the variables paradigm and Parsonsian theory, Smith portrays the pendulum as having swung too far, resulting in a network theory that is antihumanist and person-annihilating. It is necessary to reject the package of presuppositions that brings together reductionism, constructivism, pragmatism, empiricism, and positivism in order to redress network structuralism's neglect of human dignity, rights, respect, and rational deliberation (C. Smith, 2010: pp. 270, 272).

Vaisey (2009: p. 1687), grounding his approach in the dual-process model of cognitive science, puts forward a conception according to which actors are driven primarily by deeply internalized schemata (akin, he believes, to Bourdieu's habitus or to implicit consciousness), yet are also capable of deliberation and justification (discursive consciousness) when the situational demands of social interaction require it. Vaisey argues that, with their championing of culture as repertoire (which Vaisey identifies with his deliberative pole), analysts of the culture–network nexus have been focusing on only half of the cognitive process, and the less interesting half at that.

Vaisey and Lizardo (2010) applied the dual-process model to survey data relating 'worldviews' (such as whether respondents say they believe in moral relativism) to respondents' network composition at a subsequent time (e.g., whether respondents claim friends who engaged in deviant acts or who, on the other hand, volunteered in community service). Results showed that worldview had a significant and relatively large effect on subsequent network composition, controlling for aspects of network structure and composition. There are questions about whether durable moral worldviews were successfully measured (in that over 50% of the respondents were categorized as having different worldviews in the survey's second wave) and about whether survey data can provide an appropriate measure of implicit cognition (Srivastava and Banaji, 2011: p. 208), but the larger point for present purposes is the desirability of pioneering efforts such as this one to assess the effects of both implicit and discursive cognition on actors' formation of social network ties. Further in this regard, the dual-process model has been brought to the nodes and arcs of full who-to-whom social network data in the study of Srivastava and Banaji (2011). The test for implicit association that they employ is based on the measurement of response times as network actors sort descriptions that might characterize them, thus capturing the phenomenology of implicit cognition. The authors build these cognitive measures into a sophisticated exponential random graph model of network structure.

Network Actors as People Who Remember

T. Smith (2007) models networks in a highly innovative way. The context is extreme ethnic conflict. The location is Istria, the land at the northern tip of the Adriatic where Italy, Slovenia, and Croatia meet. The data concern the stories that people tell about their life histories, as these intertwine with wars and long and internecine conflicts among ethnic Italian and Croatian inhabitants of Istria. Nodes in the network are not persons or groups but narrative elements such as 'superior culture' and 'ethnic cleansing' as told to the researcher in the stories of several dozen people on each side of the conflict in Istria and (subsequently) in New York City, where Smith interviewed members of the immigrant Italian and Croatian immigrant communities. Of special importance to Smith are boundary elements that can act as bridges to otherwise unconnected narratives (those related by Italians and those told by Croatians) and transform the meaning of those story components that overlap the two narratives. At the same time, their ties to the original narratives open up opportunities for importing new meanings into existing narrative structures, which is one meaning of bridging a cultural hole (Pachucki and Breiger, 2010: p. 216).

Network actors have memories, and T. Smith's (2007) study of immigrant Istrians in New York City shows how they can deploy discursive repertoires that are consistent with ethnic reconciliation and enhanced humanity and dignity. When Istrian immigrants of Croation and Italian ancestry came to interact in New York churches, ethnic clubs, and restaurants, the narrative boundaries softened, to the point that all Istrians were now seen as common victims of external forces. Without wanting to be seen as questioning the historical fact of the fierce ethnic conflict, the researcher nonetheless emphasizes the social construction of memories of violence, and in particular their muting, as a potential step toward reconciliation and shared dignity. To be sure, silence about conflict comes at a cost as the suffering of victims is forgotten and perpetrators go unpunished; on the other hand, enshrining the bases of divisions in constitutions or land partitions would deny actors opportunities for conarration (T. Smith, 2007: pp. 43, 44). Mapping individual and collective memory (Cunningham et al., 2010) seems a promising direction for research on cultural strategies of network cognition. The further development of this line of empirical study might begin to address the concerns of C. Smith (2010), reviewed earlier, on the asserted antihumanism of social network analysis.

What Types of Network Tie Comprise Culture?

The connections among actors that are most typically studied by social network analysts are either social relationships or ties of persons to groups. If the locus of culture is 'webs of significance' (Geertz, 1973), then the question is raised as to what types of network tie adequately capture signification. We review answers to this question that have been influential for work on culture and networks.

Beyond Persons and Groups

Building on insights of Simmel, Cooley, Nadel, and Goffman, Breiger proposed in the 1970s a locus for network analysis that differed from the usual emphasis on ties among a set of social actors. Breiger suggested a 'duality' according to which groups are connected to one another on the basis of the members they share in common while, at the same time, the individuals who are members of multiple groups form a dual network. In the one network, persons are the nodes and their joint memberships in groups are the connections among the persons; in the dual network, groups are the nodes and shared persons are the ties among groups. The structure of the intergroup network and the structure of the interpersonal network are distinct but, also, mutually constitutive (reviewed in Mohr and Duquenne, 1997).

Mohr and Duquenne (1997) introduced a crucial move from networks to culture by recognizing that the formalism of this model of dual affiliation well captured a key aspect of the emphasis of Geertz and other practice theorists on the logic of culture as coconstituting the patterning of everyday activities. The ideas of a culture (e.g., 'private property') are constituted by the practices used and recognized to sustain them, even as these practices are shaped by implementations of the idea. In their application, Mohr and Duquenne studied poverty relief in New York City around the beginning of the twentieth century, and in particular the ways in which categories of the poor (such as 'fallen' and 'stranger') were associated with procedural remedies (such as help in providing employment, or putting a person in an almshouse or other long-term custodial care facility) applied to classes of persons, as this information was gleaned from directories of charity organizations. In this way, the researchers were able to deduce a web of meaning among the categories of poor person on the basis of how those categories were used.

The method used by Mohr and Duquenne was dual (Galois) lattice analysis, a technique that represents two orders of information by graphically portraying the composition of elements at each level by those at the other. Mische (2008) applies a form of three-mode lattice analysis (jointly relating persons, organizations, and events) as one among a number of innovative procedures for studying 'civic mediation,' according to which both connections and identities are constructed across social movement organizations.

In addition to algebraic techniques such as lattice analysis, statistical methods have also been used to study duality, notably the method of correspondence analysis. In a departure from usual modes of network analysis, this procedure is capable of application – as in Bourdieu's research – to categories of person (such as occupational categories) and types of cultural object (such as the distribution of preferences of each occupational category for a first communion, a sunset, or a car crash as the subject of a beautiful photograph). Rather than as a lattice, the results of correspondence analysis are often presented in a Cartesian plane, where social positions and cultural dispositions can be captured spatially and with respect to the oppositions as well as affinities that define a social field. Rouanet et al. (2000) provide a more adequate overview of Bourdieu's orientation to correspondence analysis. Further on the subject of methods for the study of duality, Charles Ragin has introduced qualitative comparative analysis (QCA) as a way of understanding cases as constituted by configurations of variables. Breiger (2009), in an application to the mobilization of ethnic subnational groups in Western Europe and the social and cultural properties of those groups, demonstrates how a form of correspondence analysis can be used to analyze the duality of cases (ethnic groups) and variables (social and cultural group properties and behaviors) that is one of the motivating principles of QCA.

Recent work has employed innovative definitions of network affiliation ties to illuminate cultural webs. Using correspondence analysis of survey data, Hedegard (2013) studies relations among racial self-categorizations in Brazil (seven categories spanning black, brown, white, indigenous, and their combinations) on the basis of respondents' tastes for 13 cultural objects (most of which are musical forms). One of the main findings is that, despite incorporation of forms such as samba and *capoeira* into the national identity, and their practice across racial and class lines, these cultural objects continue to associate with divergent racial identities.

A variety of network-analytic concepts and methods may be usefully applied to the domain of culture. In a study of four Washington, DC marches in support of lesbian, gay, bisexual, and transgender agendas and causes in the period 1979–2000, Ghaziani and Baldassarri (2011) take as their basic data structure a matrix indicating the presence or absence of each of 12 themes in each of hundreds of newspaper articles. The authors study this affiliation matrix directly, and they also study the dual theme-by-theme network that it implies. The affiliation matrix is normalized to take account of differing main effects in the popularity of themes. We believe that three kinds of analyses reported in this article will be of interest in subsequent research on culture and networks: (1) the authors apply usual concepts from network analysis (such as centrality and brokerage) to the networks of themes, identifying a stable core of themes as well as several time-varying sets of concerns that are congenial to the authors' argument for the existence of thematic 'anchors' that allow social movements to support differences within the frame of a common core; (2) representing each of the four marches as a network among the 12 thematic elements, the authors compare all pairs of networks by means of a network analysis tool (Quadratic Assignment Procedure correlation), discovering statistically significant coherence over time; and (3) they represent each of the four normalized matrices of thematic cooccurrence as a network graph, thus identifying stable and varying sets of thematic elements over time.

Another method that we believe will prove generally applicable in the study of affiliations of actors with cultural forms is relational class analysis (Goldberg, 2011), which allows the analyst to parse out groups of like-minded individuals, not on the basis of individuals within the groups sharing similar attitudes, but rather on the basis of having similar beliefs about the relations among attitudes. (An example given by the author is that two people within the same relational class might disagree vehemently about abortion, but agree that the debate revolves around women's right to control their bodies; people in a separate class might identify abortion with a complex of issues pertaining to social welfare.) Goldberg's data are in the form of a preference matrix, respondents by musical genres, and he identifies three distinctive logics

combining musical tastes and social class on the basis of his relational class analysis.

At a very different level (but one that turns out to be remarkably relevant), computational scientists and complexity theorists (Ahn et al., 2011) have built on findings of food chemists about the flavor compounds (i.e., chemical compounds) contained in many culinary ingredients. The researchers begin with a matrix of 381 ingredients used in recipes throughout the world, and 1021 flavor compounds, indicating which compound is in which ingredient. A dual projection results in a 'flavor network' in which two ingredients are connected if they share at least one compound, and the weight of each link is the number of compounds shared. Further analysis (not reported here) leads to a visualization of the flavor network. It is found that, on the basis of shared chemical compounds, ingredients used in Western European and North American cuisines are statistically similar. In North American recipes, for example, the more compounds two ingredients share, the more likely they are to appear together. However, the authors found sharply different results for Southern European and East Asian cuisines: in those cases, the more compounds two ingredients share, the less likely they are to appear together in the same recipe. The researchers could identify broad cultural regions of the world on the basis of a network of combinations of chemical compounds. This work reaffirms that only a researcher's imagination limits the kinds of data that can be brought to bear in the study of dual networks of culture and practices. We also note that the study of Ahn et al. connects to actor-network theory and its study of the interpenetration of social and nonhuman networks.

Networks of Narrative Elements

The work reviewed above focuses on affiliations between two orders of phenomena (such as persons and musical tastes). Researchers at the interface of culture and networks have also been providing innovative formulations of one-mode networks (i.e., ties among a single kind of entity, such as persons). We have already reviewed T. Smith's (2007) study of memory and ethnic conflict, in which the nodes are elements of narratives and the ties reflect sequential order in the narrative. DiMaggio (2011: pp. 295–296) reviews a wider range of network studies of narrative events, as well as computational science studies of texts. See also Varga (2011) on measuring the relative degree of fragmentation of scientific fields on the basis of cocitation analysis.

The Role of Negative Ties

Negative network ties may play a distinctively important role in culture, and may even enhance cultural creativity, as Giuffre (2009) found in a study of artists on the Polynesian Island of Rarotonga. In the past decade, the island has earned a reputation across the South Pacific as a hub for the revival of traditional Polynesian arts and as a center of artistic creativity and ferment. The island has more fine arts galleries per capita than London, New York, and smaller arts centers like Santa Fe, New Mexico. Complementing an ethnographic study, the author conducted a network analysis of artists who were asked to name the three best artists on the island, excluding themselves. A number of 'worst artist' references were also volunteered, though they had not been solicited. Among the four positions that emerged from the network analysis were the 'Stars,' consisting of artists who had been born in New Zealand of Cook Islands ancestry and who had recently arrived on Rarotonga with a reverence for its traditional culture along with a Westernized sense of professionalism and an interest in the international fine arts world. By way of contrast, the 'Old Guard' consisted mainly of older artists who had grown up in the Cook Islands and who had pursued their interests in spite of the traditional opprobrium directed against artistic careers; they were more interested in pleasing their local customers than in international standing, and they often painted local flora and landscapes. Although occupying a coherent position in the network relationally, members of the Old Guard directed virtually no esteem toward one another and, moreover, the negative ties were concentrated between the Old Guard and the Stars. A third set of artists endeavored (not too successfully) to mediate between the first two sets, and a fourth were acolytes of the Stars. It is as if the Old Guard and the Stars both served as action ideals (Swidler, 1986) that were taken to be negative by members of the other set. The negativity was heightened by the small size and confined geography of an island setting. Giuffre builds upon work by Labianca and Brass (2006) on negative social network ties in American organizations and the stultifying features of workflow demands and internal hierarchies that might make it difficult or impossible for workers to avoid those who dislike them – much as on an island. Labianca and Brass write that negative ties may be more important than positive ones in their impact on organizations.

Giuffre (2009) suggests that a mix of positivity and negativity may be necessary in social networks that foster creativity, in that the negative ties trigger critical evaluations, discourage groupthink, and (by presenting action ideals that are negative) provide a spur to expanding one's own artistic identity. This study of negative ties and creativity links in a useful way to research on symbolic boundaries. Doreian and Mrvar (2009) provide practicable methods for partitioning networks containing a mixture of positive and negative connections.

Conclusion

In this article, we have reviewed changes in the sociology of culture and in the research community of social network analysts that have led to the development of a new specialty area, research at the intersection of culture and networks. The new research has led to a rethinking both of the kinds of actors and actions that take place in networks, and of the connections among actors that are relevant. We have emphasized conversations, objections, and ongoing concerns within this evolving research community as well as research accomplishments.

DiMaggio (2011) argues that network analysis is the natural methodological framework for developing insights from leading theoretical approaches to cultural analysis. While making use of and offering some further support for that argument, we have tried also in this article to emphasize some of the benefits to network analysis of the opening to culture that has been made possible by a diverse set of researchers who share a commitment to working at the interface of culture and networks.

Culture and the Self: Implications for Psychological Theory

Joan G Miller and Malin Källberg-Shroff, New School for Social Research, New York, NY, USA

This article is a revision of the previous edition article by J.G. Miller, volume 5, pp. 3139–4313, © 2001, Elsevier Ltd.

Abstract

This article presents contemporary theory and research on culture and the self. Cultural psychology, it is shown, includes the assumption of a universal capacity for self-awareness and of culture as a system of meanings and practices that form an essential medium for human development. Discussion is given to research findings pointing to fundamental variation in psychological processes in the areas of self and social attribution, cognitive styles and perception, emotions, motivation, and cultural neuroscience. Finally, consideration is given to challenges in contemporary cultural work on the self and to contributions of this work in culturally broadening psychological theory.

The self may be defined as the individual's understanding and experience of their own psychological functioning. As such, it is basic to human experience, while at the same time, also culturally variable in fundamental ways. The present article examines the processes that contribute to the cultural grounding of self and considers implications for understanding variation in psychological processes and outcomes.

Discussion begins with a conceptual argument for recognizing the self as cultural. This is followed by a brief overview of research highlighting the existence of cultural variation in aspects of the self which has implications for different areas of psychological functioning. Finally, attention turns to a consideration of challenges in future work on culture and the self and to the contributions of this work to psychological inquiry.

Theoretical Premises

The recognition of the self as cultural is based on core assumptions regarding the nature of psychological functioning and culture. These include a conception of the person as self-reflexive and agentic, as well as a view of culture as forming a medium for human development.

This perspective assumes that, universally, individuals maintain some awareness of their own mental activity, of themselves as existing in time and space, and of acting in the world. As Hallowell argues:

> It seems necessary to assume self-awareness as one of the prerequisite psychological conditions for the functioning of any human social order, no matter what linguistic and culture patterns prevail…the phenomena of self-awareness in our species is as integral a part of human sociocultural mode of adaptation as it is of a distinctive human level of psychological structuralization.
>
> 1955: p. 75

However, this capacity for self-reflection and self-awareness give rise not only to common psychological experiences of the self, but also makes it possible for humans, through symbolic means, to formulate culturally variable subjective understandings of the self. Thus, whereas there exists universally an empirical agent or ecological sense of self, the modern Western view of self, with its associated cultural practices, represents only one of many culturally specific forms.

Along with this premise of a universal capacity for self-awareness, theorists assume that individuals are agentic in the sense that they actively contribute meaning to experience. This insight may be traced to the Cognitive Revolution in psychology, an intellectual movement that became prominent in psychology during the later twentieth century as a critique of behaviorism. From this perspective, it is understood that, rather than merely passively absorbing externally given information, individuals go beyond the information given when contributing meaning to experience. To give an example from the domain of food, it is recognized that the edibility of particular animals depends on culturally variable meanings (e.g., is eating dog acceptable or a taboo?) and cannot be explained merely on the basis of objective characteristics alone (e.g., nutritional value).

Also of critical importance to the view of self as culturally grounded is the understanding of culture as a symbolic medium for human development, encompassing shared meanings which are embodied in artifacts and practices (Geertz, 1973; Shweder and LeVine, 1984). Cultures are seen as encompassing knowledge of experience and rules for conduct as well as objects and events that are created, in part, by cultural definitions and practices. This constitutive reality-creating role of culture is recognized to be broad, extending not only to the establishment of institutions (e.g., marriages), roles (e.g., bride), and artifacts (e.g., wedding ring), but also to the creation of psychological concepts and epistemological categories. For example, to gain a deeper understanding of key psychological constructs such as emotions or theory of mind, consideration must be given to culturally variable self-understandings (such as concepts of what constitutes an emotion or of the nature of mind itself).

From the present perspective, it is understood that, whereas involuntary responses, like a reflexive response may proceed without cultural mediation, higher order psychological processes depend, on cultural input for their emergence. This insight is known as the incompleteness thesis and assumes that individuals are unable to acquire higher order psychological processes in the absence of cultural input in the form of

experiences that reflect culturally specific meanings and practices. Wertsch expresses this point:

> Cultural, institutional, and historical forces are 'imported' into individuals' actions by virtue of using cultural tools, on the one hand, and sociocultural settings are created and recreated through individuals' use of meditational means, on the other. The resulting picture is one in which…it is virtually impossible for us to act in a way that is not socioculturally situated. Nearly all human action is mediated action, the only exceptions being found perhaps at very early stages of ontogenesis and in natural responses such as reacting involuntarily to an unexpected loud noise.
>
> 1999: p. 160

Thus, for example, whether a physiological reaction to a situation is experienced in emotional terms depends, in part, on culturally based understandings of the nature, causes, and consequences of emotions, cultural routines for responding to emotions, natural language categories for defining emotions, and a range of other sociocultural processes. This leads to the expectation that qualitative differences in self-conceptions and in related modes of psychological functioning can be expected in individuals from cultural communities characterized by contrasting self-related sociocultural meanings and practices.

Impact of Cultural Variation in the Self on Basic Psychological Processes

The present section considers examples of recent empirical studies that illustrate the cultural grounding of psychological processes, an insight critical to the perspective of cultural psychology (e.g., Cole, 1996; Markus et al., 1996; Miller, 1997; Shweder, 1990). Although the overview here is necessarily highly selective and incomplete, it serves to highlight ways in which contemporary cultural research on the self is offering new process explanations of psychological phenomena as well as identifying variability in basic psychological processes.

Self-Processes and Social Attribution

Cultural research on self-perception reveals that in various Asian populations, the self tends to be experienced in more contextualized and fluid terms than typical among American populations. It has been shown that the self-descriptions of Japanese but not those of Americans tend to vary as a function of the presence of others (Kanagawa et al., 2001). Similar effects have been observed in person perception. For example, Church et al. (2006) observed that, whereas American and Euro-Australian populations tend to view traits as stable over time and generalized over contexts, various East Asian cultural populations viewed traits as more affected by situational factors. Perceptions of oneself as displaying consistency across situations has also been found to show a much weaker relationship to psychological well-being among Korean as compared with American populations (Suh, 2000), with contradictory self-knowledge more accessible among Japanese and Chinese as compared with European-Americans (Spencer-Rodgers et al., 2009).

Cultural influences on the self not only extend to perceptions of one's present behavior but also structure autobiographical memory, affecting its timing, content, and developmental course. Research has shown that the age of earliest-reported autobiographical memories is earlier among American than Chinese populations (Wang and Leichtman, 2000; Wang, 2001). This is a reflection of the emphasis placed on highlighting the self's unique perspective in American socialization practices, which encourage early narration of self-focused cognitions. As a result, the autobiographical memories of American children and adults tend to be focused on the self's unique perspective, while the autobiographical memories of Chinese children and adults tend to focus on everyday social routines and include more information about social relations. To give an example, while an American adult might recall as their earliest childhood memory their subjective feelings associated with a special event like their reactions of joy at receiving their first bicycle, a Chinese adult would more typically report a memory of a recurrent social routine such as the memory of sitting in the kitchen as their mother cooked dinner. As illustrated above, the latter type of autobiographical memory typically includes more references to aspects of the social setting, as well as includes other actors involved. These types of memories also tend to be associated with less intense affective reactions than is the case of the memories typically generated by Western populations.

Recent meta-analyses have documented a tendency for non-Western cultural populations to engage in less self-enhancement than is typical among American populations (Heine and Hamamura, 2007). For example, it has been demonstrated that a wide range of non-Western cultural populations including Chileans (Heine and Raineri, 2009) and Fijiians (Rennie and Dunne, 1994) tend to score lower on measures of positive self-view than do Western populations, with various East Asian populations even showing self-effacing or self-critical biases (Heine and Hamamura, 2007). Recent work also highlights the dynamic nature of self-enhancement tendencies and how these are sensitive to contextual variation. For example, East Asian populations do not tend to show self-effacing tendencies when comparing themselves to the average other (e.g., "How friendly are you compared to most people?"), as compared with absolute terms (e.g., "How friendly are you?"; Hamamura et al., 2007). Research in this area has also utilized a version of the Implicit Association Test. Among Japanese and American populations, findings indicate that the tendency to self-enhance primarily occurs among Japanese populations when assessed implicitly, but not when assessed explicitly, such as through conventional self-report measures (Kitayama and Uchida, 2003). This work then provides an indication that some level of tactical self-enhancement is universal while also supporting claims of marked cross-cultural differences in its prominence.

Cognitive Styles and Perception

The ecological model of cognitive differentiation, developed in early work in cross-cultural psychology, provides a central foundation for contemporary work on cognitive styles in cultural psychology. In groundbreaking research, Berry (1974, 1976) provided evidence to support the claim that the

demands set by particular ecological conditions give rise to cultural practices that are adapted to these demands and that, in turn, lead individuals to develop distinctive patterns of cognitive and perceptual skills. In support of this claim, individuals living in ecological conditions that make hunting an adaptive activity were shown to develop better visual discrimination and spatial skills than developed by individuals whose cultures were adapted to different ecological demands. Integrating this framework with work on cognitive differentiation and testing it in an extensive body of research, Witkin and Berry (1975) forwarded a model of culture and cognitive styles that linked culturally based socialization practices adopted in response to different ecological conditions to the development of field dependent as compared with field independent individual cognitive styles.

Addressing many of the same issues and sharing many assumptions with this earlier tradition, contemporary cultural research is building on claims that East Asian populations tend to emphasize a holistic cognitive outlook that privileges a dialectical approach to thought, whereas the outlooks of Western populations give priority to an analytic outlook (Nisbett, 2003). These outlooks are explained in evolutionary terms as having their origins in different social and cultural systems that existed in Ancient Greek and Chinese society such as the tradition of free debate found in Ancient Greece as compared with the emphasis on social control that characterized ancient China. In terms of psychological implications, the contrasting cognitive styles are seen as giving rise to cultural differences in logic and perception.

In terms of logic, Chinese as compared with American participants have been shown to prefer dialectical over classical Western analytic arguments (Peng and Nisbett, 1999). As part of this research, respondents were presented with scientific conclusions that pointed to opposite empirical relationships such as findings that smoking is associated with being thin and findings that suggested the opposite. When presented with such contradictory evidence, Chinese tended to be moderately accepting both positions, whereas the judgments of Americans became more polarized. Work has also shown not only that preferences for analytic as compared with holistic thinking are culturally variable but that in East Asian cultural groups holistic thinking is normatively preferred and is seen as entailing more sophisticated modes of cognition than the forms of holistic thinking prominent among Western populations (Buchtel and Norenzayan, 2009).

Regarding perception, East Asian populations have been found to be more sensitive than Western populations to contextual information presented in a peripheral way as part of the background to a scene (Masuda and Nisbett, 2001). Thus, this research has demonstrated experimentally that the memory of Japanese but not of American respondents is affected by whether an object is presented in the context of its original setting or in a novel setting. Differences in emphasis on analytic versus holistic cognition have also been demonstrated to affect the phenomena of change blindness. Long considered a basic perceptual capacity that is insensitive to cultural variation, change blindness involves the inability to detect changes in objects or scenes that are being viewed. Research on change blindness among Americans has indicated tendencies for individuals to be more sensitive to changes in focal objects than to objects in the periphery or context, whereas the opposite effect has been shown to occur among Japanese (Masuda and Nisbett, 2006).

Recent work also suggests that cultural variation in context sensitivity relates to the tendencies of East Asians to allocate their attention more broadly than Americans, with each culturally linked cognitive style associated with particular advantages and drawbacks. More specifically, it has been found that East Asians are better than Americans at detecting color changes when a set of colored blocks are expanded to cover a wider region but worse than Americans when the same set of blocks are shrunk in size (Boduroglu et al., 2009). Also, European-Americans tend to be more attentive to using part-object cues in perceptual inference than are Asian-Americans (Ishii et al., 2009). For example, in the above study, participants were asked to guess the identity of an object in a picture based on either a small square of the picture (part-cue) or a blurred version of the whole picture (holistic cue).

Contemporary studies are also exploring the extent to which these cultural differences in allocation of attention may be related to features of the physical and sociocultural environment. For example, a comparative study of landscapes found in comparable US and Japanese cities revealed that Japanese urban scenes include more elements than matched American urban scenes (Miyamoto et al., 2006). These same types of cultural differences have also been found in art, with East Asian paintings characterized by greater context inclusiveness and less object centeredness than Western art (Masuda et al., 2008). Findings in this area provide further evidence that cultural variation in patterns of attention may be explained, in part, by the affordances and constraints of different physical settings in our natural and human-made surroundings.

Emotions

Emotions provide a particularly interesting area for cultural research on the self as they involve behavioral action tendencies and somatic reactions, in addition to cognitive appraisals. Recent research points to culture as a powerful influence on the expression and form of emotional reactions, as well as on their mental health implications.

Culture has been observed to impact on the elaboration and interrelationship of different emotions. For example, whereas all cultures employ both socially engaged emotions (e.g., friendliness, happiness) and socially disengaged emotions (e.g., pride, feelings of superiority), among Americans only socially engaged feelings are linked with general positive feelings, whereas among Japanese both types of emotions have such positive links (Kitayama et al., 2006). Researchers have also documented that cultural groups differ in the valence and degree to which they cross-associate different emotions. Thus, for Americans, the affective experiences associated with positive and negative emotions tend to be negatively correlated, while, for Chinese and Koreans, they tend to be positively correlated (Bagozzi et al., 1999). In general, when asked how they feel, Americans tend to report one dominant, positive or negative, emotion at a given time, while East Asians are more likely to report experiencing positive and negative emotions simultaneously. Likewise, Japanese are more likely than Americans to report experiencing both

positive and negative emotions simultaneously about the same exact experience (Miyamoto et al., 2010; Spencer-Rodgers et al., 2010).

Culture also influences how emotional experiences are linked to different situations and adaptive responses. For example, Americans report stronger self-oriented emotions such as pride than East Asians in success-oriented situations (Imada and Ellsworth, 2011). Similarly, memories of success tend to be more accessible than memories of failure among European-Americans, whereas among East Asians both types of memories tend to be equally accessible. Notably, for East Asians, negative emotions typically do not lead to the same negative consequences for self-regulation observed among Americans. For example, individuals from East Asian cultural backgrounds tend to work harder after experiencing the disappointment of failure, while American populations typically experience a decrement in motivation after experiencing the same disappointment or failure (Zhang and Cross, 2011). Research has also shown that the detrimental consequence of reflecting on negative feelings about oneself is mediated by cultural meanings and practices. For example, self-reflection, or brooding, is associated with fewer depressive symptoms among Russians than among Americans, reflecting stronger tendencies among Russians to self-distance themselves during such processes (Grossmann and Kross, 2010).

Finally, culture also impacts the understanding and experience of emotions themselves. Thus, as compared with Dutch adults, Turkish adults tend to categorize emotions as more grounded in assessment of social worth, more reflective of reality than of inner subjective states of the individual, and as located more within the self–other relationship and less confined within the subjectivity of the individual (Mesquita, 2001).

Motivation

Whereas psychological theories of motivation tend to center on the distinction between internal and external locus of control (e.g., Rotter, 1966), cultural work is broadening the existing theoretical models by demonstrating that motivation may assume socially shared forms. This can be seen in the relative emphasis on secondary control, documented to occur among Japanese populations. Secondary control involves a type of agency that entails striving to accept and adjust to situational demands, as well as allowing others to assume or share some control over one's situation (vicarious control; Morling et al., 2002, 2003). This is in contrast to primary control where the focus is on personal influence. Morling and her colleagues found that Americans were better able to recall primary control/influencing situations than adjusting ones (secondary control), whereas Japanese were better able to recall adjusting situations than influencing ones. As an illustration of this, in coping with stressors, such as pregnancy, Japanese also relied more on secondary control involving family members than did Americans. Research in India, likewise, points to the existence of joint forms of control, in which the agent and their family members are experienced as together agentic in bringing about certain outcomes such as academic achievement (Sinha, 1990).

In related work, research has highlighted the positive affective associations linked to role-related social expectations in family and friend relationships in collectivist cultural groups. For example, Asian-American children tend to experience greater intrinsic motivation for an anagrams task that has been selected for them by their mothers than for one that they have freely chosen (Iyengar and Lepper, 1999). In contrast, European-American children tend to experience greater intrinsic motivation when they have selected the task for themselves. Comparative research has further demonstrated that Chinese children interpret the directive behaviors of teachers in more positive terms than do American children (Zhou et al., 2012). In these cases, the Chinese children perceived the teachers' behaviors as less controlling than did the Americans. They also reported being more motivated in their classes than the American children. Findings like these help explain the apparent paradox of Chinese teachers appearing highly controlling their student's behaviors, and yet their students showing strong academic performance and motivation, a relationship typically not found in American classrooms.

Similar types of findings showing agency as compatible with meeting social expectations are also found in research on attribution, calling into question claims that link agency uniquely with individualism. One such study found that Indian adults associated a greater sense of moral duty with meeting the needs of their friends than did Americans (Miller et al., 2011). Furthermore, compared with Americans they also reported greater feelings of choice or of wanting to help, rather than of feeling pressured to help with meeting the needs of their family and friends. While providing evidence for the universality of choice and of internalization in motivation, this work also highlights the need to broaden current work on self-determination theory (e.g., Chirkov et al., 2003). It demonstrates that cultural variation exists in the affective meanings of role obligation, and in the degree to which acting out of a sense of role-based duty is experienced in agentic ways.

Cultural Neuroscience

In recent years, research in cultural psychology is making increasing use of neuroscience approaches. This, in part, reflects the more general growth of neuroscience work in psychology in recent years, particularly with the advent of new methodological tools such as functional neuroimaging.

A major direction of contemporary work on the self in cultural neuroscience is the examination of neurological correlates of culturally variable psychological phenomena (e.g., Ambady and Bharucha, 2009; Chiao and Ambady, 2007). For example, comparisons of the performance of American and East Asian college students on visuospatial tasks has revealed that in each cultural group activation in the frontal and parietal brain regions is greater during culturally nonpreferred as compared with culturally preferred judgments (Hedden et al., 2008). Since these brain regions are known to be associated with attentional control, such results indicate that greater attention is required to process stimuli that are less culturally familiar. For example, Hedden and his colleagues demonstrated that processing of a task that

involved relative as compared with absolute comparisons of the size of two stimuli involved less activation of the parietal brain regions among the East Asian sample than among the American sample. This reflects the East Asian participants' cultural preference for contextually based information processing, thus requiring less attention, with the reverse observed among the Americans.

Cultural neuroscience also provides evidence that in cases where cross-cultural variation exists in social understanding, different brain mechanisms may be implicated. For example, distinct brain regions are activated among both American and Japanese adults when undertaking theory of mind tasks. These are believed to reflect cultural differences in the relative focus on mental state as compared with contextual information (Naito and Koyama, 2006), Similarly, further research indicates that Japanese respondents show greater brain activation of the inferior frontal gyrus, a brain region linked to emotional processing, than do American respondents (Kobayashi et al., 2008). Also, research in cultural neuroscience is providing evidence that the same brain regions may be recruited in the service of culturally variable modes of self-understanding. One such finding suggests that whereas the medial prefrontal cortex tends to be recruited in representing only information about the individual self among Western populations, among Chinese the same brain region is recruited in representing both the self and close others (Zhu and Han, 2008).

An additional direction of contemporary work in cultural neuroscience is the examination of cultural influences on neural plasticity. Recent work has shown that American young adults engage object-processing areas in the ventral visual cortex more than Chinese young adults when assessed on a visuospatial task (Gutchess et al., 2006). Additionally, findings from research conducted among elderly populations indicate that this cultural difference in brain processing actually increases with age, with elderly Singaporeans displaying larger deficits in object-processing brain areas than elderly Americans (Chee et al., 2006). Such work provides neurological support for a 'use it or lose it' view of cognitive aging, indicating that culture influences not only how brains are used, but also patterns of loss in brain functioning associated with aging (Park and Huang, 2010).

Implications

Challenges

A major challenge in contemporary work on culture and the self is to develop more sophisticated and sensitive approaches to culture (Miller, 2012). Much of the work in cultural psychology to date has been informed by the interdependent/independent distinction or the related East/West or collectivism/individualism dichotomies, distinctions that have been tapped empirically in research by the use of standardized scales (Cross et al., 2011). This perspective on culture has grown in prominence in recent years with the emergence of priming techniques to assess culture (e.g., Oyserman and Lee, 2008). For example, one type of priming involves presenting individuals with a paragraph that describes the behavior of an individual who is referred to either only with the pronoun 'I,' in the independent case, or by the pronoun, 'We,' in the interdependent case (e.g., Gardner et al., 1999). However, these types of approaches are limited by their tendencies to gloss over important distinctions between and within cultures, and by giving limited attention to the impact of context on behavior.

One way that theorists are working to address this challenge is to give more attention to within and between culture variations in outlooks that may be linked to regional, ethnic, or socioeconomic differences. To illustrate, research has identified distinct regional concerns among geographically distinct groups of Americans, with investigators observing such differences as a concern with personal growth and feeling cheerful being emphasized in the US Southwest, compared with a concern with not being socially constrained in New England (e.g., Markus et al., 2004). Researchers are also increasingly attending to the impact of social class. For example, recent findings suggest that individuals from a lower social class as compared with those from a higher social class are more prone to act in a prosocial manner (Piff et al., 2010) and to place greater emphasis on contextual considerations in social attribution (Kraus et al., 2010). An increasing amount of research focuses on expanding comparisons to more cultural groups. This type of stance can be seen in work showing that Central and East Europeans tend to be more holistic than are Americans (Varnum et al., 2008) and, similarly, that southern Italians are generally more interdependent than northern Italians (Knight and Nisbett, 2007).

However, even with this greater attention to diversity, it remains vital to approach work in this area with theoretical understandings that are more culturally specific than the types of dichotomies characterizing present research. It is important to recognize that, while there are similarities between the responses of working-class individuals within the US and those of various collectivist cultural groups from other countries, marked differences also distinguish subgroups of different cultural and ethnic backgrounds from the same country, while simultaneously interacting with influences of social class. It is not only important to extend analysis to more culturally diverse subgroups, but also vital to assess aspects of culture that are more nuanced than the present well-worn cultural comparisons such as the broad distinction between analytic versus holistic thought. For example, forms of holistic thinking are not only found in East Asian cultural communities but are also evident in India as well as various European and South American cultural groups, calling into question theories that explain the origins of these modes of thought in terms of historical traditions linked to Greek and Chinese thought. Instead, it appears likely that preferences for analytic versus holistic thought are anchored in some type of shared features that are highly functional in the communities where they exist. By attending to the distinctive beliefs, practices, and historical traditions of more specific cultural communities, it will be possible to identify more subtle and dynamic insights into cultural and subcultural viewpoints. To make sure future theoretical improvements are even more refined, a further challenge is to make efficient use of the rich traditions of anthropology and sociology, by incorporating their findings into empirical research.

Similarly, as work from a cultural psychology perspective gives greater attention to neurological evidence, it is important to attend to challenges involved in adopting such approaches (e.g., Kagan, 2007). It must be recognized that in many cases neuroscientific evidence merely confirms the findings of research utilizing conventional methods, while adding little theoretical value to existing conclusions. In addition, consideration needs to be given to the extent to which many contemporary neuroscience findings reflect what has been characterized as the 'seductive allure' of neuroscience, thereby supporting unwarranted deterministic conclusions (Gergen, 2010; Miller and Kinsbourne, 2012). This 'seductive allure' is essentially the tendency of neuroscience findings to be favored by the media, funding agencies, and policy makers because they suggest a material cause to something behavioral. The simplicity of a material cause can thus be very appealing, leading to fewer pursuits of alternative explanations. An example of this can be seen in the case of adolescent risk-taking. Findings from neuroscience describe the adolescent brain as fairly immature compared with the brains of adults. These findings have been proposed as a biological explanation for risk-taking tendencies common among adolescents (Steinberg, 2007). Supporters of this view have further suggested that environmental influence on risk-taking is likely limited. This conclusion is sharply deterministic, especially when considering cross-cultural evidence indicating considerable variation in adolescent risk-taking. In particularly, those cultures with norms surrounding adolescence that are distinctly different from those in modern Western societies tend to have less reported occurrences of adolescent risk-taking behavior (Miller and Kinsbourne, 2011).

Contributions

Research on culture and the self is broadening existing psychological constructs and theories through the identification of alternative normative endpoints for human psychological functioning. It is providing insight into ways that cultural meanings and practices form a medium for human development. Dynamic in nature, work on culture and the self is attempting to move beyond the overly static and global tendencies of earlier models. This is seen in recent attempts to transcend traditional East–West comparisons, taking into consideration within-culture variation as well as variation related to social class.

Even while addressing challenges and evolving in new directions, research on culture and the self continues to make major contributions to basic psychological theory. Findings from this line of research serve to make explicit the often implicit cultural processes that underlie existing psychological theory. By continuously working toward identifying models of human psychological experience that are more culturally inclusive than present ones, this type of research forms a necessary part of any truly universal theory of the self.

Finally, one of the most important contributions that research on culture is making is continuing to move beyond the linear approach. That human psychological functioning has different normative endpoints depending on cultural influences is relatively easy to digest. Harder, but all the more interesting, is turning the focus away from the continuum to something akin to parallel, qualitatively different, psychological universes. Evidence from cognition and perception, some of which was highlighted earlier, illustrates this point particularly well. When something as seemingly straightforward as the perception of the physical world is culturally variable, implications for human development are far-reaching. This is not to suggest an extreme form of relativism that precludes all comparison. However, it does require considerably more effort and the challenging of preconceived notions at every corner.

Culture as a Determinant of Mental Health

Carolyn B Murray, University of California, Riverside, Riverside, CA, USA

© 2015 Elsevier Ltd. All rights reserved.

Abstract

This article investigates the cultural determinants of mental health for ethnic minorities (i.e., African Americans, Asian Americans, Latinos, and Native Americans) within the USA. The existing literature indicates that different cultures encourage different worldviews, which can either predispose its members to certain disorders or buffer their immediate effects. In addition, these cultures can shape the interaction between the mental health provider and their clients through symptom presentation, diagnosis, and treatment. This article concludes that, given the complexity of human behavior, it is futile for mental health practitioners to attempt an understanding of ethnic minorities without adequate exploration of each client's individual historical background, societal treatment, subcultural values, and unique conflicts.

Introduction

Parallel to the revolution occurring with regard to the development of psychopharmacological therapies and biological theories of mental disorders, the health sciences and related professions are undergoing a less visible change in theory and practice that promises to radically alter traditional notions about the nature of mental health (Kao et al., 2004; Kleinman and Benson, 2006). The main underlying tenant of this occurrence is the belief that social determinants are critical variables for understanding the etiology, treatment, and prevention of many mental disorders previously attributed to biological causes. Known as 'cross-cultural psychology,' this approach is defined in terms of the study of behavior and experience as these occur in different cultures. Cross-cultural psychology is not in itself a separate branch of psychology, but rather a unique point of view and methods applicable in principle to all other areas of psychology (Ratner and Hui, 2003).

The interplay between culture and mental health is complex and multidimensional with respect to antecedents, perceptions, expressions, and treatments for a variety of mental disorders. Since 1965 the cultural and racial makeup of the United States has changed more rapidly than during any other period in its history. The antecedents of this change were (1) reform in immigration policy in 1965, (2) the increase in self-identification by ethnic minorities, and the (3) reduction in birth rates, especially among non-Hispanic White Americans. America is now a cultural diverse, racial, and ethnic society. Along with this increase in cultural diversity, however, are very serious disparities regarding the mental health status, nosology, and services delivered to cultural minorities (U.S. Department of Health and Human Services, 2001; Bussing and Gary, 2012).

This article investigates the cultural determinants of mental health for nondominant ethnic minorities (i.e., African Americans, Asian Americans, Latinos, and Native Americans) within the USA. The likelihood that different cultures encourage different worldviews that buffer or predispose its members to certain disorders is examined. In addition, we also examine whether these cultures shape the interaction between the mental health provider and their clients through symptom presentation, diagnosis, and treatment. It is proposed that social forces play a critical part in mental health, particularly the attitudes and expectations held by societal authorities (e.g., police, social workers, therapists) toward minorities. This article concludes that, given the complexity of human behavior, it is futile for mental health practitioners to attempt an understanding of ethnic minorities without adequate exploration of each client's individual historical background, societal treatment, subcultural values, and unique conflicts.

The Conceptualization of Culture

In general, culture consists of those aspects of life that people construct and share within a specific reference group (e.g., race, ethnic, social class, age cohort, gender, nationality, and/or profession). The term 'culture' is so widely used and multidimensional in its applications (e.g., learned as opposed to instinctive behavior; tools humans create; and values and traditions) that its precise meaning varies from one situation to another (Kao et al., 2004). Culture can be seen as the collective heritage of a people handed down from generation to generation. It includes language, religious beliefs, customs, rules of etiquette, and ideas used by people to organize and interpret their lives and existence. Thus, the term 'culture' refers generally to the way a people live, the rules of behavior promoted, and the conduct they set for themselves.

As a nation of immigrants, the USA has evolved into a multicultural society. Most researchers, however, address race and ethnicity as demographic characteristics rather than as distinct predisposing cultural and social environmental orientations. This approach has resulted in research and analyses that ignore the contributory role of sociocultural factors to mental health behaviors. Research is needed to understand how these factors contribute to individual and group coping and adaptive mechanisms, particularly in alleviating the distinct socioeconomic and psychological disadvantages of categorical membership. Culture should be conceptualized as a potential individual and group resource, providing psychological, social, and personal identification and group connectedness and worldview (Kao et al., 2004).

Diagnostic and Statistical Manual of Mental Disorders: The Relevance of Culture

In 1952 The American Psychiatric Association, recognizing that practitioners needed a common language and standardized criteria in order to diagnose and communicate effectively with each other, began publishing the *Diagnostic and Statistical Manual of Mental Disorders* (DSM). It evolved from a United States Army manual that reported census data and psychiatric hospital statistics to standardized psychiatric diagnostic categories and criteria. Today, the DSM is the diagnostic tool of choice for identifying psychiatric disorders within the United States and internationally. Relevant to the present topic, during the last three decades, however, the manual has been severely criticized for its superficial coverage of the role of culture in diagnosis and treatment of mental illness (Kao et al., 2004; Mezzich et al., 1999; Sue et al., 2012; Sue and Sue, 1999). In response to this criticism in 1994 the DSM-IV introduced cultural considerations for the use of diagnostic categories and criteria, including a glossary of cultural-bound syndromes and idioms of distress along with an outline for cultural formulation. Leading cross-cultural psychiatrists argued that this update further perpetuated the idea that Western cultural phenomena are universal with nonwestern cultural phenomena being 'culture-bound' aberrant manifestations, and its criteria are rarely applied even when it is appropriate to do so (Kleinman and Benson, 2006).

The most recent attempt to incorporate culture into the treatment of mental disorders has resulted in the vastly improved *DSM*-5 (APA, 2013). For instance, in the previous edition, the DSM-IV-TR the use of the term 'culture-bound' made mental health conditions that were specific to a certain population appear highly localized and confined – a bag of oddities (APA, 2013). The list was also heterogeneous in that some 'syndromes,' including *nervios*, seemed to represent specific situational predicaments, or variations in the way people express their distress, rather than coherent collections of symptoms. Other expressions, such as *ataque de nervios*, are syndromes, but do not always represent psychopathology. Still others (like *shenjing shuairuo* or 'neurasthenia') appeared to be a cover term for several common, but seemingly unrelated, human maladies (e.g., fatigue, dizziness, headache, GI problems, sexual dysfunction, excitability); another group of conditions simply defied DSM categorization, such as *mal de ojo* ('evil eye').

The recently updated DSM-5 includes a 'Glossary of Cultural Concepts of Distress,' and a section on the cultural formulation, featuring a revised version of the outline introduced in DSM-IV as well as an approach to assessment, using the Cultural Formulation Interview. In addition, the chapter includes a section discussing 'Cultural Concepts of Distress.' The notion of 'culture-bound syndromes' has been replaced by three concepts: (1) *cultural syndromes*: "clusters of symptoms and attributions that tend to co-occur among individuals in specific cultural groups, communities, or contexts…that are recognized locally as coherent patterns of experience"; (2) *cultural idioms of distress*: "ways of expressing distress that may not involve specific symptoms or syndromes, but that provide collective, shared ways of experiencing and talking about personal or social concerns"; and (3) *cultural explanations of distress or perceived causes*: "labels, attributions, or features of an explanatory model that indicate culturally recognized meaning or etiology for symptoms, illness, or distress" (APA, 2013). The information provided throughout DSM-5, and particularly in the cultural formulation chapter should help practitioners avoid misdiagnosis, obtain clinically useful information, improve clinical rapport and therapeutic efficacy, guide research, and clarify cultural epidemiology.

Culture and Coping

Culture is transmitted through the process of socialization. Throughout this process, both general and specific behavioral patterns for promoting human survival and growth are conditioned. What are learned are acceptable standards and idealized norms that reflect the hard-won wisdom of previous generations. Through culture, biological adaptive capacities are extended to deal with environmental demands. By understanding the ways that individuals from various cultural traditions cope with mental illness, health researchers and practitioners can gain unique insights into the promotion of human health and prevention of human illness (Chen and Mak, 2008).

For nondominant minority group members, the problems of living are not only the products of biological dysfunctions, aberrant intrapsychic development, and familial dysfunctions, social forces also contribute to the onset and course of mental illness (Kleinman, 2009). Political, social, economic, and historical and present-day relationships (e.g., slavery, legal discrimination and segregation, immigration exclusion and restrictions, internment, poverty, and forced removal to reservations) with the dominant group in the USA, further contributes to mental illness among minorities (Woods et al., 2012). In effect, the larger society has played a major role in the developmental etiology of certain mental health disturbances (Wilson et al., 2000). How do the majority of people of color, in spite of ethnic and racial exploitation, cope and succeed?

To answer this question, culturally defined strengths associated with ethnic minority group life should be illuminated. While racial and ethnic groups of color vary widely in the content of cultural beliefs about time, harmony with nature, reciprocity, uses of traditional medical substances, and community healers, certain common themes emerge. These include deep and abiding community respect for elders, an extended kin network, predominant family commitment, cultural aversion to institutional care, and a clear expectation for respect and dignity in the delivery of health care. Some researchers have specifically commented on the elaborate support networks, extended family relationships, and role flexibility common to African Americans; the strong sense of communalism, generosity, and harmony characteristic of Native Americans; the socialization of children to respect the entire family system and to put family needs over individual needs in Asian American communities; the socializing toward cooperativeness, and the comfort of their Catholic faith in times of stress found in Latino communities (U.S. Department of Health and Human Services, 2001; Wilson et al., 2000). These group characteristics facilitate coping and mental health, and lessen the nature and expression of disease

and chronic conditions, and are necessary to consider for successful care and treatment.

Culture dictates how people cope with everyday problems and more extreme types of adversity. For instance, in comparison to White Americans, many Asian American groups tend not to dwell on upsetting thoughts, believing that reticence or avoidance is better than outward expression. Such Asian subgroups place a higher emphasis on suppression of affect (Chen and Mak, 2008), with some tending to first rely on themselves to cope with distress. Asian Americans are also less likely to seek social support because they are more cautious about potentially upsetting their social network (Kim et al., 2006). This cautious approach to medical health challenges sheds some light on why Asian Americans report an unwillingness to speak to anyone regarding mental health concerns. Interestingly, Asian individuals exposed to and influenced by Western norms and practices hold more positive attitudes toward seeking professional help and actually used more mental health services (Leong et al., 2011). These findings demonstrate the importance of cultural beliefs in shaping help-seeking attitudes and behaviors (Chen and Mak, 2008; Mallinckrodt et al., 2005).

African Americans, on the other hand, tend to take an active approach in facing personal problems, rather than avoiding them. They are more inclined than Whites to depend on handling distress on their own or within familial settings (Conner et al., 2010). They also appear to rely more on spirituality to help them cope with adversity and symptoms of mental illness (Mattis et al., 2007; Ward et al., 2013). African-American older adults, for instance, suffer more psychological distress than their White counterparts due to their exposure to and experiences with racism, discrimination, prejudice, poverty, and violence (Williams et al., 2003) and they tend to have fewer social and financial resources for coping with this stress than their White counterparts (Choi and Gonzalez, 2005). In one study, when asked to identify effective coping strategies for their depression, the most common strategies included handling depression on their own, pushing through the depression, denial, and relying upon God (Conner et al., 2010).

While there are group commonalties, intragroup differences exist in life-course environmental conditions, reflecting differential life experiences and various degrees of acculturation. Thus, there is an indisputable need for mental health care providers to treat each client as an individual, while gathering information on the degree to which cultural coping strategies may facilitate mental health. It is imperative to conduct cross-cultural research on ethnic minorities within the US and within other multicultural societies to identify the relationship between culture-specific coping skills and mental health outcomes.

Cross-Cultural Perception and Expression of Mental Illness

Although most, if not all, cultures have a notion of mental or psychological illness, ethnographic studies demonstrate that concepts of emotions, self and body, and illness categories differ so significantly cross-culturally that it can be said that each culture's beliefs about normal and abnormal behavior is distinctive (Kleinman, 1988). The prevalence and course of mental illness also varies cross-ethnically. Recent research comparing African Americans to Whites indicated no difference between the two groups with regard to the percentage of panic disorders. However, African Americans present a greater frequency of reported tingling in the extremities and a higher mean number of symptoms (Draguns, 2000).

Another study estimated the lifetime prevalence of seven psychiatric affective disorders (i.e., panic disorder, agoraphobia, social phobia, generalized anxiety disorder, post-traumatic stress disorder, major depressive disorder, and dysthymia) for older non-Hispanic White people, African Americans, Caribbean Black people, Latinos, and Asian Americans. The findings indicated that major depressive disorder and social phobia were the two most prevalent disorders among the seven psychiatric conditions. Overall, Whites and Latinos consistently had higher prevalence rate of the seven disorders, African Americans had lower rates of major depression and dysthymia, and Asian Americans were typically less likely to report affective disorders than their counterparts (Woodward et al., 2012). There were also across and within group variations that followed demographic, socioeconomic, and immigration status.

Another classical difference often ignored by Western practitioners is the finding that bodily states and psychological experiences are monitored, perceived, assessed, and reported differently by members of different cultural groups. A consistent finding is that body complaints predominate over psychological complaints in depressive and anxiety disorders among members of non-Western societies, ethnic minorities in the US, and among less educated members of the lower socioeconomic classes (Chen and Mak, 2008).

Culture also influences how depression is experienced and communicated. This may be due to some cultures perceiving the physician as a healer of physical ailments as opposed to psychological ailments. The urgency and sense of legitimacy surrounding physical ailments may vary across cultures, as may the degree to which psychological weakness is stigmatizing. The biology of depression and anxiety disorders underwrites the inner form of these disorders, but cultural beliefs and values shape their expression (Kleinman, 2009).

Etiological Beliefs and Folk Approaches

All healing systems are shaped by the values, worldviews, and self-views of the cultures in which they develop and are utilized. Therefore, all healing systems are in a real sense 'ethnomedical.' Rules and principles guiding the various ethnomedical models form discreet and different genre, making cross-ethnic comparisons difficult. However, while distinctions among the non-Western groups are difficult to delineate, very salient differences exist between various ethnomedical models and traditional Western methods in psychotherapy. For instance, Western psychotherapy is traditionally a one-on-one activity that encourages clients to discuss the most intimate aspects of their lives with health practitioners. In Latino culture, clients rarely describe their complaints as the main step in an intake process since they expect the healer to already know their

complaints (Koss-Chioino, 2000). Due to experience with oppression, African Americans are hesitant to self-disclose. This may serve a protective function against possible physical and psychological harm (Conner et al., 2010), but individuals who do not self-disclose may be seen as resistant, defensive, or superficial by the therapist. Many minorities who are reluctant to self-disclose are judged to be mentally unhealthy and, in the case of African Americans, are diagnosed as 'paranoid' (Murray, 1998; Williams et al., 2003).

In spite of the differences in each group's healing practices, cultural commonalties do exist across the four ethnic groups described in this article. Specifically, the commonalties consist of (1) a widespread belief that the causes of mental illness exist outside the person, (2) preference for a group orientation to healing (i.e., family and/or community) as opposed to an individual orientation, (3) an emphasis on morality as a cause and condition for recovery (Koss-Chioino, 2000), and (4) an emphasis on short-range goals, as opposed to long-range goals (Sue and Sue, 1999). These similar healing practices are common to other non-Western groups but different from most Western therapeutic practices.

Latinos, Asians, Native Americans, and African Americans are all heterogeneous groups, and they have many specific traditions that differ from each other in profound ways (Jimenez et al., 2012). But there are similarities as well. A belief in Divination (i.e., beliefs in the supernatural and practices to connect with the spirit world), for example, was originally part of each of these groups' healing practices. Unlike Western cultural groups who have discarded such practices, divination is still part of the healing practices of many, but not all, of the subcultural groups within each of the broader categories. Among Native Americans, for example, traditional healing practices vary along tribal lines and are largely shamanic (spiritual intervention to heal the sick). One of the major shamanic healing entities is the Native American Church, which is a pan-Indian religion based on a ritual that facilitates direct contact with the Great Spirit (also God) through peyote, pipe and cigarette smoking, drumming and songs, sweat lodge practices, and prayer (Koss-Chioino, 2000). African American healing practices differ in beliefs, practices, and types of healers based on locale (e.g., north vs. south, and places of special tradition such as the Sea Islands of South Carolina). Overall, the underlying belief system of African Americans is a blend of medical beliefs of an earlier day, African beliefs about voodoo, European folklore regarding the supernatural world, and fundamentalist Christianity (Carter, 2002; Mattis et al., 2007).

Etiological notions are divided into natural and unnatural categories, varying from unhealthy lifestyles and nonproductive worry to beliefs in evil influence or God taking punitive action. Physicians or herbalists can cure the first two causes, but the latter two causes demand intercession of a religious healer or a direct contract with God. Among Latinos, divination may involve a healer's use of shells or tarot cards as a guide to see into the spirit world to identify the cause of the client's problem. The healer describes the client's problems (e.g., somatic distress, bad feelings, and persistent interpersonal or social problems), and then the client confirms (most frequently) or denies their origins. Very little epidemiological data are available on the utilization of ethnomedical treatments by Latinos in the USA (Cervantes, 2010). The existing data, however, indicate that the utilization of divination varies across Latino ethnic populations. Within the USA, divination appears to be a flourishing mental health alternative in Miami, Florida, particularly among the Cuban population, and among some Dominican immigrant populations. Estimates among Mexican Americans vary from 7% in San Diego to 54% in South Texas (see discussion in Koss-Chioino, 2000). It is important to note that some studies separate the belief in traditional healing practices from reports of actual use, so discrepancies may not be so extreme.

Variations are especially salient among Asian Americans (e.g., Chinese, Japanese, Vietnamese, Koreans, and tribal people such as the Hmong or Lao) (Gerdner, 2012). Among the Chinese, shamanic healing (e.g., divination) has not been reported in the USA. The Chinese-American ethnohealers emphasize a balanced and disciplined life to maintain physical and psychology health. In addition, physical/bodily manipulation, acupuncture, massage, and breathing exercises are common. In contrast, some Southeast Asians in the USA see shamans (e.g., folk healers, witch doctors) when they are available (see discussion in Koss-Chioino, 2000). This propensity to visit shamans is motivated by the belief that spirits are omnipresent throughout nature and can cause or heal illness. For example, there occurs among adult Southeast Asians, particularly male Hmong refugees living in the USA, a 'Sudden Death Syndrome.' Autopsies produce no identifiable cause of the death: A person in apparently good health went to sleep and died without awakening. Often, the victim displayed labored breathing, screams, and frantic movements just before death. Prior to their deaths, these men reported that they were experiencing spirit visitations, and that the spirits were unhappy and were punishing them. Furthermore, these deaths do not appear to have a primary biological basis, whereas the deaths do appear to involve psychological factors, including a belief in the imminence of death – either by a curse or some form of punishment (Sue and Sue, 1999).

Western-trained therapists too often dismiss these belief systems and impose their own explanations and treatment upon culturally different clients. Without an understanding of the underlying cultural beliefs, there exists the tendency for the therapist to overestimate the degree of pathology. In the case of Southeast Asian men who report spirit attacks, a Western traditional therapist would most likely diagnose these people as paranoid schizophrenic, suffering from delusions and hallucinations (Sue and Sue, 1999). Such a diagnosis would most likely lead the therapist to prescribe a powerful antipsychotic drug and perhaps institutionalization. Studies indicate, however, that shaman techniques cure these symptoms (Sue and Sue, 1999). The effectiveness of such treatment may lie in the client's belief in the power of the doctor (shaman) and/or the treatment (divination) received.

While the four groups presented here vary in their degree of homogeneity concerning beliefs in spiritual attacks, a substantial number of each group do hold these beliefs. Western medicine does not embrace indigenous or alternative healing approaches and often rejects such approaches as unscientific. Using a culturally inappropriate approach may result in harm or even death (e.g., as in the case of Sudden Death Syndrome). In an attempt to insure cultural responsiveness, the mental

health practitioner must either incorporate the legacy of ancient wisdom that may be contained in indigenous models of healing or refer the culturally different client to a culturally appropriate healer (Sue and Torino, 2005).

The Impact of Ignoring Culture in Therapy

Culture thus impacts both mental health and therapeutic intervention. Specifically, culture influences our understanding of the major stages of the clinical process: patient and practitioner explanatory models of sickness; perception, labeling, and presentation of symptoms; health-seeking behavior; doctor–patient communication; curing and healing; and lay and health professional evaluations of therapeutic outcomes. Culture exerts its most fundamental and far-reaching influence through the categories we employ to interpret and respond to sickness. As previously discussed, different societies and ethnic groups within one society often affix different sickness labels to the same syndrome (Kleinman, 1988). When patient and practitioner explanatory modes reflect different cultural backgrounds, the clinical realities they define can be, and frequently are, quite disruptive to the treatment process. When those explanatory models are in conflict, the results may be client dropout, noncompliance and dissatisfaction, and/or practitioner missed diagnosis, inappropriate treatment, and poor quality of care. All of these consequences exacerbate existing problems and may even create new issues for the client (Smedley et al., 2003).

Although the percentage of ethnic minorities is increasing in the USA, and more interest is being paid to establishing cross-cultural criteria for diagnosing and treating clients (APA, 2013), culturally sensitive training is dismal at best (Woods et al., 2012). Furthermore, the practice of substituting a model stereotype (i.e., the most frequent behaviors of middle-class White males) for the real world, while disregarding cultural variations – in a dogmatic adherence to some universal notion of truth – culminates in a technique-oriented definition of the therapeutic process. As a result, a lack of culturally responsiveness forms of treatment is the single most important reason given for ethnic minorities being underserved, inappropriately served, resulting in a significantly higher drop-out rate (U.S. Department of Health and Human Services, 2001).

Another significant aspect of cross-cultural awareness is the acknowledgment that disadvantaged people often experience oppression, discrimination, and racism, as well as limited access to treatment because of their economic or employment status. A lack of sensitivity on the part of mainstream therapists concerning such issues often results in further abuse of the minority ethnic client (Murray, 1998). On every index, minorities have been found to receive fewer and poorer quality services. Specifically, African Americans and Latinos, in contrast to Whites – holding symptoms constant – were less often given individualized psychotherapy, more often jailed instead of hospitalized, and more often treated with pharmacotherapy instead of talk-therapy (Smedley et al., 2003). Many studies have demonstrated that clinicians, given identical test protocols, tend to make more negative prognostic statements and judgments of greater maladjustment when the individual was said to come from a lower rather than a middle-class background, or was an ethnic minority member (Smedley et al., 2003).

When ethnic minority clients are met with insensitivity or outright racism on the part of the therapist, poorer outcomes are likely to result. Thus, the need for changes in the mental health delivery system is real. For mental health professionals to effectively deliver services to members of a negatively stereotyped group, they must first become aware of their own culture and assumptions about human behavior, values, biases, preconceived notions, personal limitations, and so forth. Second, they must actively attempt to understand the worldview of their culturally different clients in terms of the etiology, coping strategies, and course of mental disorders (Murray, 1998). Cross-cultural sensitivity has been accomplished when the therapist has (1) an understanding of his or her own culture and achieved self-awareness; (2) an understanding of the client's culture; (3) an understanding of the client's relationship to the sociopolitical system; (4) an understanding of the ways in which generic counseling and therapy may limit the potential of the client; (5) an array of therapeutic techniques at his or her disposal; and (6) a willingness to exercise institutional intervention on behalf of the client when appropriate (Sue and Sue, 1999).

Conclusions

In conclusion, culture plays a role in every aspect of mental health, from prevention to diagnosis to treatment. Cultural influences vary greatly from individual to individual. Many mental health problems have culture-common, culture-specific, or both components. In the case of members of historically disadvantaged minority ethnic populations, too often the larger society's role in the developmental etiology and maintenance of certain mental health disturbances is ignored. However, the literature does suggest that racial attitudes that poison our society and are internalized by mental health professionals can hamper the efforts of people of color to maintain or regain their mental health (Smedley et al., 2003). In addition, despite the fact that coping is fundamental to our understanding of human health, mental health professionals often do not acknowledge characteristics of minority cultures that are adaptive and facilitate coping within a stressful environment. Every culture represents a unique solution to the myriad forces imposed on its members. Cross-cultural differences exist in perceptions of mental illness in terms of beliefs about the causes, the prevalence and course, and the experience of symptoms. Within the therapeutic environment, therapist/client communication, diagnosis, intervention strategies and techniques, client use of health facilities, and the course of mental disorders have all been impacted by culture. Therefore, mental health care providers must be trained to identify the role that culture plays in mental illness. The culturally sensitive professional goes beyond the qualities of concern, empathy, and credibility. They have self-knowledge and a willingness and ability to take the cultural background of clients into consideration. Without self-knowledge and cultural sensitivity on the part of the therapist, the mental health needs of ethnic minorities will remain underserved and inappropriately served at best, and at worst ethnic minorities will continue to be

misdiagnosed and victimized under the guise of therapeutic intervention.

Culture, Cognition and Embodiment

Abstract

The study of relationship between the cultural and the mental in the social and human sciences stands at crossroads. The classical approach to this issue attempts to derive individual cognition from abstract cultural patterns external to the mind, and conceives of culture as an external, emergent order of symbols organized as 'systems.' These internalized 'symbols of mind' provide the essential foundation of individual cognition. In contrast to this view, we have a now growing set of perspectives emerging at the intersection of cognitive science, cultural and cognitive anthropology, developmental psychology, robotics, and the philosophy of mind and action. These 'embodied' approaches to cognition reject the classical view of cognition as the organization of sense data via recourse to conventional cultural symbols. Instead, cognition is seen as tightly linked to practical action and as inherently 'grounded' in the nonarbitrary features of human bodies as they relate to the material environment.

Introduction: Beyond the Classical Theory of Culture and Cognition

The study of relationship between the sociocultural and the mental in the social and human sciences stands at crossroads. On the one hand, there is the continued dominance of what the author refers to as the 'classical' approach to the relationship between the cultural and the mental. The classical approach attempts to derive individual cognition from abstract cultural patterns external to the mind, and conceives of culture as an emergent order of symbols organized as 'systems,' linked to their 'referents' by conventional (arbitrary) correspondence relations (Shore, 1996; Saussure, 1966). These internalized 'symbols of mind' provide the essential foundation of individual cognition. The human animal is a thinking animal insofar as it is a social (and socialized) animal (Geertz, 1973a,b,c; Berger and Luckmann, 1966). This is the stance characteristic of cultural theorists in anthropology and cultural and cognitive sociology starting with Durkheim, and continuing on to Parsons, Geertz, Zerubavel, and Alexander (Parsons, 1972, 1968; Zerubavel, 1999; Alexander, 2003).

On the other hand, we have a now growing (but heterogeneous) set of perspectives emerging at the intersection of cognitive science, cultural and cognitive anthropology, developmental psychology, robotics, and the philosophy of mind and action (Clark, 1997; Bloch, 1998a,c; Shore, 1996; Brooks, 1997; Ingold, 2000; Thelen and Smith, 2002; Lakoff and Johnson, 1999). This set of postclassical perspectives, usually glossed under the banner of 'embodied' approaches (e.g., Varela et al., 1991; Lizardo, 2012; Ignatow, 2009; Garbarini and Adenzato, 2004; Lakoff and Johnson, 1999; Gallese and Lakoff, 2005), reject the classical view of cognition as the organization of sense data via recourse to conventional cultural symbols. Instead, cognition is seen as tightly linked to practical action and as inherently 'grounded' in the nonarbitrary features of human bodies as they relate to the material environment (Bourdieu, 2000; Ingold, 2000; Shore, 1996). In this respect, the recent emphasis on both *embodiment* and *grounding* along with the equally resounding rejection of the view that personal experience is *constituted* via the internalization of external symbols represents a recuperation of a theoretical legacy that was emphatically disavowed in twentieth century (Durkheim-inspired) social and cultural theory in anthropology and sociology (Ingold, 2000). This is an approach to cognition that anthropologist Maurice Bloch (1977, 1986) once referred to (provocatively) as a 'psychological' approach to cognition, in contrast to the then dominant (classical) 'anthropological' approach to the question.

In what follows, the author retains the broad thrust of Bloch's argument, but drops the invidious disciplinary labels. The author does this mainly because the issue is no longer one of choosing between 'psychology' (or cognitive science) and 'sociology' as Durkheim (1982) once suggested and as some contemporary theorists of the culture–cognition link – (e.g., Zerubavel, 1999) – continue to believe. In what follows, the author sticks to the 'classical' and 'embodied' labels to refer to these broad sets of perspectives since allegiance to either viewpoint cuts across all disciplines in the social and human sciences. The basic argument is that classical approaches to the question of the relationship between culture and cognition can no longer afford to ignore the challenge posed by embodied perspectives. More strongly, the author argues that embodied approaches to cognition pose such a strong challenge to the theoretical and conceptual core of the classical approach as to render the latter untenable as a future basis for the study of culture and cognition in the social sciences.

The rest of the article is organized as follows: first the basic claims, presuppositions, and parameters of the classical approach are outlined (in Section The Classical Theory of Culture and Cognition). Then the author goes on (in Sections The (Cognitive) Problem of Internalization and The (Cognitive) Problem of Meaning) to show that this approach runs into trouble (in relation to embodied approaches) on two fundamental issues in the study of culture and cognition: what he refers to as the (cognitive) problem of the internalization of culture and the problem of meaning (how persons use cultural symbols for representational purposes). The article closes (Section Conclusion) by outlining the broader implications of the argument.

The Classical Theory of Culture and Cognition

According to the classical view, culture is composed of abstract symbolic representations that require some sort of connection to arbitrary carriers of meaning in order to signify (i.e., to be meaningful). Proponents of this model presuppose that perceptual information that is gathered directly through the senses is 'meaningless' because it is composed of preconceptual, 'raw' stimuli that require processing, transduction, schematization, and linkage to symbolic structures in order to become meaningful. Traditional cultural theory follows Weber (1946), Berger and Luckmann (1966), and Geertz (1973d) in portraying actors as "…*obsessed with sorting out empirical reality* and, typifying from code to event" (Alexander, 2003: p. 124, italics added). Meaning comes only from the collective symbolic categories learnable through the culture. According to this perspective, culture consists of a conventional corpus of symbolic structures (which, following Saussure (1966), are conceptualized as the arbitrary coupling of amodal mental representations) with a material carrier of meaning. These representations organize sensory experience and thus partition the world into arbitrary categories of persons, things, and events (Leach, 1976; Douglas, 1986).

The classical theory follows the Kant-inspired dictum that primary experience is composed of lower order sensory information that carries unique, idiosyncratic, and evanescent content. In order for this sensory content to become generic and durable (and thus part of the cultural repertoire of the social agent), it must be linked to more permanent, mnemonically available symbolic systems (D'Andrade, 1992). That is, sensory events must be 'typified' (e.g., persons, objects, and event tokens must be seen as singular representative of a larger class of entities) in order to be meaningful to the person (Parsons and Shils, 1951; Berger and Luckmann, 1966). Accordingly, persons require symbolic cultural structures in order to generalize across sensory events and to characterize the most relevant features of experience so that it can be available for future use. Under this view, symbolic structures organize experience, but sensory information cannot be stored and encoded in the same format as it is encountered in the world. Instead, sensory input must be 'transduced' (or converted) into a different (symbolic) format distinct in nature from the 'raw' form that constitutes our phenomenological experience (Barsalou, 1999; Ignatow, 2009). The classical theory thus requires that the social agent be at the mercy of culturally acquired symbolic structures in order to classify different sorts of sensory stimulation as belonging to the same category (Durkheim, 1995; Durkheim and Mauss, 1967; Zerubavel, 1999; Douglas, 1966).

The classical theory of culture and cognition implicitly accepts without question the traditional philosophical division of mental contents into those that are directly traceable to the senses and those more abstract representations that have at best an indirect connection to experience (ideas) that we inherit from the rationalist philosophical tradition. The classic philosophical debate deals with the possible existence of mental representations that are not traceable to experience (e.g., Kantian a priori categories). This contrasts with the empiricist (from Hobbes to Locke to Hume) argument that *all* mental contents are ultimately traceable to sensory stimulation and what were called ideas were simply weakened, schematic remnants ('images') of what once was a sensory event. Kant famously argued against British empiricism (and the Humean skepticism regarding the existence of preexperiential knowledge structures) that there had to be an analytical (and ontological) hiatus between abstract ideas (categories) and concrete sensory stimulation. The reason for this is that sensory stimulation in itself was insufficient to produce generalizable concepts with universal validity; empiricism results in irrationalism. The fact that such concepts existed thus required an appeal to a transcendental argument for the existence of knowledge structures that do not come from experience. Thus, the very conditions of possibility of meaningful knowledge required an argument to the best explanation, which clinched the necessary existence of preexperiential abstract conceptual structures that brought order and organization to perceptual experience.

In this respect, the classical sociological theory of culture and cognition can be thought of as a 'sociologization' – which we owe to Durkheim (1995) – of the original Kantian proposal, in which the notion of the a priori is dropped and the categories are given an empirical etiology in society. Durkheim accepted the perception versus high-level cognition binary but deconstructed it by moving the debate away from the realm of abstract epistemological argumentation and remapping the cognition/perception dichotomy to the distinction between the society and the individual (Durkheim, 2005). Even if most people would find the latter assertion questionable (and the Durkhemian argument was immediately assailed as question begging), the Kantian analytical division between sensory stimulation and abstract conceptual structure is kept intact in the modern theory of culture and cognition. The same goes for the Kantian presumption that direct sensory stimulation is inherently meaningless, noncategorical, and nongeneralizable unless it is fitted into a previously existing high-level system of abstract symbolic concepts (Schmaus, 2004).

According to Durkheim, sensory stimulation (and practical action in the world of objects) is evanescent and it is not sufficient for the formation of durable mental categories that generalize from experience. Here, Durkheim rejects both the classical empiricist and the then emerging 'pragmatist' argument for the emergence of general ideas from individual action all the same. Only particular forms of structured interaction in collective ritual occasions or (in differentiated societies) direct instruction from an authoritative representative of such a collectivity could instill in the mind durable categories of the understanding that had that property of generalizing or abstracting from experience. These categories were able to some extent to go beyond evanescent individual experience and had the ability to generate authoritative consent. For Durkheim, the *validity* of the categories was inseparable from their *cognitive authority*. Durkheim equated 'religious phenomena' with those mental contents that were not of individual but of collective origin and that were not open to revision in the light of further experience. Thus Durkheim linked the concept/percept, obligatory/elective, collective/individual, and sacred/profane dichotomies, with

the first and second pair of each opposition corresponding to one another (Durkheim, 1975).

Parsons (1972) accepted this theory of the origins of general ideas, reasoning that these are the components of a *cultural system* that individuals have to internalize in order to learn to typify experience. Parsons' only tweak on the Durkheimian account came in providing a more detailed social mechanism for the internalization of cultural contents. Parsons proposed that this internalization is realized via socialization in the family environment characteristic of differentiated societies that ensure the transmission of the overarching schemes of categorization that make up the culture. Parsons adapted the Freudian notion of 'introjection' to do the requisite explanatory job, but recast Freudianism as an anthropological theory of cognitive socialization. Parsons castigated Freud for proposing a 'simplistic' theory of the reality principle, which presumed that persons simply formed veridical representations of external reality without necessarily having recourse to a socially acquired system of cultural categories. According to Parsons, rather than taking this 'naïve' a-sociological stance, abstract, general representations of the objective environment had to be mediated by a system of collective categories that persons internalized via a learning process. According to Parsons (1964: p. 23), Freud "failed to take explicitly into account the fact that the frame of reference in terms of which objects are cognized, and therefore adapted to, is *cultural* and thus cannot be taken for granted as given but must be *internalized* as a condition of the development of mature ego-functioning" (italics added). Cultural sociologists today might reject the outdated mid-twentieth century psychoanalytic language, but they retain the notion that persons somehow come to internalize culture conceived as "a system of *generalized* symbols and their meanings" (Parsons, 1964: p. 29, italics added).

The (Cognitive) Problem of Internalization

Given this theoretical legacy, the classical theory of culture and cognition provides no way of conceptualizing the enculturation process other than through the metaphorical imagery of the (format-preserving) 'transfer' of objectified cultural contents (e.g., values, beliefs, propositions) *from* the *external* environment *into* the 'internal' environment of the person. Enculturation is thus (naturally) conceptualized as a learning process (Wrong, 1961) and learning as the re-creation of a copy of public culture within the cognitive environment of the actor. Traditional cultural theory thus presumes that persons become encultured subjects through a process of *internalization of objectified cultural contents* and that this internalization requires linguistic 'transmission' of these contents to be effected (Berger and Luckmann, 1966; Parsons, 1964). The major theoretical schools in cultural and cognitive sociology today differ only on the presumed nature of what this content is – whether it is 'values,' 'conceptual schemes,' 'classifications,' or 'codes' (Parsons, 1951, 1964; Zerubavel, 1993; Alexander, 2003). The *content* internalization requirement is never subject to question: all theorists continue to hold on to some modified version of the presumption that the final product of this process is the storage of some (systematic?) set of lingua form representations of external culture.

The basic idea is that in order for an agent to be socialized, something external, or social has to be converted into something internal or personal (on this score, see Wrong, 1961; Parsons, 1964; Bush and Simmons, 1981; Cook-Gumperz, 1973). We can then explain systematic cross-individual and cross-group variations in values, practices, and beliefs as well as the systematic *patterning* of individual behavior within a given society over time, as a result of the differential transmission and acquisition of the relevant cultural and symbolic endowment that characterizes a given collectivity (Cook-Gumperz, 1973: p. 3). Accordingly, one of the key meanings of socialization is essentially, "the [social] transmission of culture" (Wrong, 1961: p. 192; Long and Hadden, 1985: p. 42). This process of socially mediated cultural transmission is conceived as implying the mental modification of the agent who is at the receiving end of the cultural conduit mechanism (Parsons, 1964: p. 23). The production of a set of individuals who share cultural patterns through socialization (i.e., cultural transmission) processes can then be used to answer the question of the origins of systematic patterns of action in social collectivities.

Most American sociologists have recognized – ever since the influential critique of the functionalist penchant to equate socialization with the 'internalization' of values – that there are important limitations to this formulation of the socialization process (e.g., Heritage, 1984; Swidler, 1986). While contemporary sociologists are quick to reject the Parsonian value-internalization account (thus abandoning Parsons account of the emergence of social order via the production of value consensus), they continue to abide by the Parsonian model of *cognitive* socialization. In other words, most sociologists continue to believe that people share cultural contents (e.g., worldviews and beliefs) because they internalize those contents from the larger culture. As we saw above, for Parsons, *both* 'values' and the broader 'conceptual schemes' through which social actors come to know and classify the entire world of objects, agents, and situations have to be internalized (Parsons and Shils, 1951; Parsons, 1964). Any theory that presupposes that persons introject the basic categories with which they make sense of the world from the external environment is still essentially a 'Parsonian' theory of enculturation even if the adjective Parsonian has come to (wrongly) be limited to the 'value-internalization' account.

Accordingly, the Parsonian theory of culture and cognition is (discouragingly) hard to distinguish from contemporary approaches, especially in presuming the wholesale internalization of entire conceptual schemes by socialized actors (Long and Hadden, 1985). That there is something deeply wrong with this model of the process of socialization has been noted repeatedly, even as something pretty close to this model is still implicitly assumed in a lot of contemporary empirical research, especially in cultural and cognitive sociology. For instance, Alexander chides postfunctionalist conflict theory for failing to emphasize "…the power of the symbolic to shape interactions from within, as normative precepts or narratives that carry *internalized* moral force" (Alexander, 2003: p. 16; italics added; see also pp. 152–153 of the same book on the internalization of cultural codes). For his part, Eviatar Zerubavel notes that

> [t]he logic of classification is something we must learn. Socialization involves learning not only a society's norms but also its distinctive classificatory schemas. Being socialized or acculturated entails knowing not only how to behave, but also how to perceive reality in a socially appropriate way. By the time she is three, a child has already internalized the conventional outlines of the category 'birthday present' enough to know that, if someone suggests that the she bring lima beans as a present he must be kidding. (Zerubavel, 1999: p. 77)

Through what specific mechanisms 'the symbolic' or 'logics of classification' are actually learned or internalized by the social agent is never actually specified (Turner, 1994). Lizardo (2012) draws on embodied cognition approaches to propose a solution to the problem of the internalization of culture that rejects the representationalism of the classical account.

The (Cognitive) Problem of Meaning

The continued dominance of a conceptualization of culture as a 'superorganic' system of symbols, coupled with a conceptualization of cognitive socialization as the 'internalization' of those meanings, is inseparable from a view of internal experience as itself composed of symbols. Accordingly, a foundational substantive claim of the classical theory of the culture–cognition link is that cultural symbols either structure or constitute mental experience (Berger and Luckmann, 1966; Geertz, 1973a). From this perspective, humans are symbol-using animals because without symbols they would not be able to *make sense* of their experience. This links with the claim – noted above – that perceptual states are an incoherent, structureless flux that must be fitted into a grid of cultural symbols to be made meaningful (Leach, 1964; Martin, 2011). Stronger versions of this approach propose the substantive hypothesis that mental contents, insofar as they are the product of some form of learning or enculturation (conceptualized as the 'internalization' of external symbols), are themselves symbolic. That is, just as symbols exist 'in the world,' they exist (in similar format) as 'symbols of mind' (Kolers and Roediger, 1984).

Embodied approaches to the same set of issues summarily break with these well-entrenched tenets of classical cultural theory. Two basic observations deserve to be highlighted in this respect. First, from the perspective of embodied approaches to cognition, it is incoherent to suppose that mental experience can be 'symbolic' in the same sense that external cultural symbols are symbolic (Kolers and Smythe, 1984). Instead, there is a conceptualization of mental experience as inherently grounded in perception and action (Barsalou, 1999; Johnson, 1987). In this sense, the 'components' of mental experience do not and cannot share the 'bipolar' structure of cultural symbols, which must couple external vehicles to semantic content in order to be meaningful. The phenomenological contents of our mental experience, on the other hand, are *directly* meaningful (Johnson, 1987; Shore, 1996); they do not require symbolic 'transduction' to be made so (Barsalou, 1999). Precisely because external cultural symbols are bipolar couplings of form and meaning, the mind cannot be thought of as a 'repository' of symbols as naive models of learning and memory implicitly presuppose (Roediger, 1984). Second, it is also incoherent to suppose that perceptual states lack structure or form an incoherent flux waiting for the order provided by linguistic or cultural categories (Gibson, 1979; Merleau-Ponty, 1962). Embodied approaches to language, semantics, and meaning construction show that abstract cultural categories are grounded on image-schematic conceptualizations extracted from perception and action, and not the other way around (Bloch, 1991, 1986; Johnson, 1987).

Proponents of embodied approaches to the culture–cognition link propose that the meaningful component of mental experience is primarily made up of repeated, embodied *simulations* over previous experiences. These simulations are enacted using neural structures that support the same sensory modality that made possible the experience in the first place (Barsalou, 1999). Consistent with so-called dual process models of learning and memory (Smith and DeCoster, 2000; McClelland et al., 1995), embodied cognition theorists propose that these simulations can reconstitute both the rich content of previous experiences as well as its most cross-modally recurrent features, which schematize over that content. Schematization implies the structured 'forgetting' of irrelevant or context-specific detail and the preferential retention only of those features that are correlated across instances (McClelland and Rumelhart, 1985). Accordingly, the conceptual potential accessed by cultural symbols covers both rich experiential content as well as memory for higher order correlations across experiences organized in the form of sensory schemas.

Embodied cognition theorists reject the influential proposal that recourse to linguistic symbols is a necessary component of meaningful experience (Bloch, 1998b). Even if persons did not have recourse to linguistic and cultural symbols, experience would be meaningful in this embodied sense, as it was for our prelinguistic ancestors. In contrast to some well-entrenched postulates of cultural theory, cultural symbols do not exist because they are required to produce meaningful mental experiences. Even if linguistic symbols did not exist, persons would still have a subjective – and even an intersubjective (Gallese, 2003) – grasp of the world as a meaningful structure. This grasp is based on our fundamental capacity to interact in the world and with our conspecifics at a basic embodied level and to extract the basic contours of experience from repeated exposure (Ingold, 2000). It is important to keep in mind that the 'perceptual symbols' constitutive of mental experience are not equivalent to the (external) 'cultural symbols' prominent in the classical theory. In embodied approaches to cognition, the use of cultural symbols is seen as the *exploitation* of *external* forms for purposes of evoking or accessing the rich semantic potential of the perceptual symbols constitutive of mental experience (Shore, 1996; Clark, 1997).

If cultural symbols neither constitute experience nor are they required (in the strong sense postulated by classical cultural theory) to 'make sense' of this experience, then what is their primary function? From an embodied cognition perspective, cultural symbols rather than constituting our subjective semantic potential *serve to evoke or access this preexisting potential in patterned ways*. The semantic pole of a cultural symbol is typically linked to a set of perceptual symbols in their

role as the *simulators* for the concept(s) that constitutes the 'cognitive meaning' of the symbol (Barsalou, 2009, 2003, 1999; Strauss and Quinn, 1997). This *evocation model* of the way that cultural symbols operate contrasts sharply with both the 'constitutive' model inherited from structuralism and with the 'sense-making' model inherited from phenomenology (Bloch, 2006; Shore, 1996).

In contrast to the classical theory, which privileges conceptual structures over primary experience, in embodied cognition approaches experience is primary and 'abstract' concepts must be grounded in bodily experience (Johnson, 1987; Lakoff and Johnson, 1999). The basic presumption is that meaning is not 'symbolic' in the strong sense; instead, the potential to invoke a given semantic content must preexist the establishment of a link between an external symbol and that particular sort of mental experience. In this respect, cultural symbols do not 'mean' anything directly; instead, they serve as prompts for persons to engage in (individual or collective) acts of *meaning construction* (Shore, 1996). The semantic potential of cultural symbols thus depends on the meaning construction potential embodied in persons. This meaning construction potential is irreducibly experiential (Bourdieu, 1990; Ingold, 2000); it does not emerge from the 'internalization' of cultural symbols. Instead, persons use large compendia of (domain general) imaginative, cognitive, affective, and motor-schematic *capacities* to create meaning 'online' (Langacker, 1987; Fauconnier and Turner, 2003). Without the meaning construction potential generated by experience, cultural symbols do not mean much. Rather than providing the person with the capacity to create meaning cultural symbols *afford access* to richly detailed, multimodal forms of mental experience in context.

From the point of view of embodied approaches, the external cultural symbols of the classical theory neither serve as access points to conceptual content nor do they serve exclusively as prompts to initiate acts of meaning construction. In addition to these functions, external cultural symbols also serve as a way to usefully delimit and condense the sort of cognitive meaning that is thereby accessed, while at the same time serving as external coordinators of both evocation and meaning construction episodes. The reason for this is that for embodied cognition theorists, cultural knowledge (as embodied in persons) is not symbolic, amodal, or propositional in the usual sense and therefore not partitionable into delimited units of chunks. Instead, this knowledge is perceptually grounded and continuous, with one packet of knowledge blending onto others. This is what Clark (1987, 1997) has referred to as *superpositional storage*. As such, cognitive meaning as embodied in person has an 'associational' and not a 'rule-based' structure (Sloman, 1996), with one packet of meaning serving as an evocation point for a wide array of associated conceptual content. This implies that the orderly, structured evocation of meaning (as, e.g., observed in highly institutionalized domains) must rely on some sort of external support or 'scaffolding' (Clark, 1997; Lizardo and Strand, 2010), and that support is provided by cultural symbols. Cultural symbols coordinate access to the *delimited* chunks of conceptual knowledge in action, in a way that would be difficult (if not impossible) in their absence. This is particularly important in the case of ritual occasions, where conceptual knowledge must be evoked in time in the right sequence and in the prescribed time and context (Durkheim, 1995).

Conclusion

From the perspective of embodied approaches to cognition, it is becoming increasingly clear that cultural theorists who depart from the classical perspective have mischaracterized the nature, purpose, and structure of human cognition and have thus given misleading accounts of the effects of socially acquired cultural categories on individual experience. Because of this, cultural and cognitive sociology lacks a credible (or coherent) account of what is it that 'culture' is supposed to do in order to influence individual cognition. One major source of incoherence (and embarrassment) for the classical account is that it requires that the person be subject to a massive, systematic process of socialization into the symbolic system that makes up the culture.

Yet, anthropologists became dissatisfied with the traditional culture concept, precisely because as much as they looked, such chronic exposure to socializing institutions and such repeated attempts on the part of socializing agents to impart the precepts that made up the culture were nowhere to be found. Yet persons somehow ended up becoming functioning members of their respective collectivities, while sharing explicit and implicit knowledge structures (Bourdieu, 1990; Palsson, 1994; Toren, 1999; Ingold, 2000). This means that persons somehow acquire culture, but without having recourse to the usual mechanisms of cultural transmission emphasized in the classical account. This phenomenon is similar to the 'poverty of stimulus' situation that Chomsky first noticed was the main weakness of the mid-twentieth century behaviorist account of language acquisition. In order for a coherent theory of the relationship between culture and cognition to get off the ground, the conception of what the raw material of experience is, and by implication both the conception of what 'culture' is and thus of how society manages to constrain thought and action, has to be radically altered.

Abstract

In 1952 A.L. Kroeber and Clyde Kluckhohn formulated a definition of 'culture' that became a mantra for a generation of cultural anthropologists who came of scholarly age in the middle of the twentieth century. Little did Kroeber and Kluckhohn know that for the next 50 years the idea of 'culture,' in its anthropological sense, would be frequently debated, doubted, distrusted, and scorned and associated with a variety of sins. Nor could they have anticipated that at the beginning of the twenty-first century the idea of 'culture' would be a key concept in many of the social sciences, while cultural anthropology would remain a scene for various kinds of 'anticultural' or 'postcultural' critiques. Nevertheless, a concept of 'culture' very much like the one recommended by Kroeber and Kluckhohn remains useful in social science research today. The concept of 'culture' not only survives; it thrives, and for good reason.

Introduction: Kroeber's and Kluckhohn's Prediction

"…few intellectuals will challenge the statement that the idea of culture, in the technical anthropological sense, is one of the key notions in contemporary American thought." That prediction was made in 1952 by the American anthropologists A.L. Kroeber and Clyde Kluckhohn in the introduction to their monumental book *Culture: A Critical Review of Concepts and Definitions* (1952). Kroeber and Kluckhohn even began their famous treatise proclaiming the idea of culture comparable in explanatory importance to the idea of gravity in physics, disease in medicine, and evolution in biology. They ended by adducing a unified (albeit ponderous) definition that became the mantra for cultural anthropologists who came of scholarly age in mid-century. "Culture," they wrote, "consists of patterns, explicit and implicit, of and for behavior acquired and transmitted by symbols, constituting the distinctive achievement of human groups, including their embodiments in artifacts; the essential core of culture consists of traditional (i.e., historically derived and selected) ideas and especially their attached values; culture systems may, on the one hand, be considered as products of action, on the other hand as conditioning elements of further action" (1952, p. 357).

Kroeber and Kluckhohn were students of intellectual history and brilliant culture theorists, but they were not prophets. Little did they know that during the 50 years following the publication of their book the idea of 'culture,' in its mid-century anthropological sense, would be frequently debated, doubted, distrusted, and scorned, that the discipline of cultural anthropology itself would be 'rethought,' 'remade,' 'recaptured,' and 'reinvented' time and time again. They did not foretell the many types of humanists and social scientists (cognitive revolutionaries, structuralists, poststructuralists, sociobiologists, feminists, skeptical postmodernists, post-colonialists, subalterns, globalization theorists) who would associate the concept of 'culture' with a variety of supposed sins. Sins such as 'essentialism,' 'primordialism,' 'representationalism,' 'monumentalism,' 'reification,' 'idealism,' 'positivism,' 'functionalism,' 'relativism,' 'sexism,' 'racism,' 'ethnic conflict,' 'colonialism,' 'Orientalism,' and just plain old-fashioned stereotyping (see, e.g., Abu-Lughod, 1991; Asad, 1973; Borofsky, 1994; Clifford and Marcus, 1986; Denzin, 1996; Fox, 1991; Freeman, 1983; Hymes, 1972; Kuper, 1999; Marcus and Fischer, 1986; Rabinow, 1983; Reyna, 1994; Rosaldo, 1989; Said, 1978; Sangren, 1988; Scheper-Hughes, 1995; Spiro, 1986; Wikan, 1995).

Nor did Kroeber and Kluckhohn anticipate the ironic fate of the concept of 'culture' at the beginning of the twenty-first century. The irony is that today the idea of culture is once again a key concept in many of the social science disciplines, yet is viewed with great suspicion in some quarters of cultural anthropology. The irony is that after being reviled, pummeled, and rejected by one new wave intellectual movement after another an idea of 'culture' very much like the one recommended by Kroeber and Kluckhohn in 1952 remains useful and defensible in social science research and public policy debates. The concept not only survives, it thrives (see for example, Harrison and Huntington, 2000; Huntington, 1996; Landes, 1998; Prentice and Miller, 1999; Kitayama and Markus, 1994; Wierzbicka, 1997).

It is noteworthy that even in Kroeber and Kluckhohn's time anthropologists outside of the American tradition were skeptical of the concept of culture. The British social anthropologist A.R. Radcliffe-Brown once remarked that he found 'culture' to be a 'vague abstraction' not particularly useful in the study of social life. Continuing in that tradition Adam Kuper has argued that institutions and other 'elements' of society should be studied separately rather than "bound together into a single bundle labeled culture" (Kuper, 1999). But many social anthropologists, including some who have deeply criticized the culture concept or its uses, have nonetheless recognized the importance of attending to the 'ideas and values' or 'cultural content' associated with institutionalized social relationships (see e.g., Beattie, 1964; Malinowski, 1944). Attention to 'cultural' kinds of knowledge and processes allows one to comprehend certain prevalent ideas or values as more than just the particular products of particular institutions.

In this latter sense, 'culture' is not regarded as equivalent to or parallel to other dimensions of social life like economics or politics but as something more basic and pervasive – as a set of

understandings that gives sense and meaning even to, say, acts which might on the surface appear entirely economic or political in character (see Geertz, 1973; Peacock, 2005, p. 54, Rosaldo, 1989; Sahlins, 1976; Sewell, 2005). Roy D'Andrade, for example, has discussed the concept of 'institutionalized values': the values (such as obedience, in-group loyalty, and patriotism) that people in a society agree are important in enacting some role (such as a soldier in the army) and are consensually used to evaluate specific role performance (D'Andrade, 2008). D'Andrade points out that cultural differences seem greatest when one takes 'institutional values' as the unit of analysis in cross-cultural investigations.

The contemporary discipline of anthropology continues to be a scene for various kinds of 'anticultural' or 'postcultural' critiques. Nevertheless, many social scientists rehearse and recite some definition of culture and make good use of it in their scholarship (see, e.g., Appadurai, 1996; Comaroff and Comaroff, 1991; D'Andrade, 1984; Dumont, 1970; Geertz, 1973; Kronenfeld et al., 2011; LeVine et al., 1994; Peacock, 2005; Sahlins, 1995, 1999; Sewell, 2005; Shore, 1996; Shweder, 1991; Shweder and LeVine, 1984). It remains to be seen whether and just how soon the concept regains its former popularity in anthropology.

The 'Standard View' of Culture in North American Anthropology

In the narrower 'humanistic' sense of the term, 'culture' refers to the control of elementary human impulses through the refinement of judgment, taste, and intellect and, by extension, to those activities believed to express and sustain that sophistication (like art or other 'high productions of mind'). What one might call the standard anthropological view of 'culture' is much broader, encompassing, as Renato Rosaldo writes: "the everyday and the esoteric, the mundane and the elevated, the ridiculous and the sublime. Neither high nor low, culture [in the anthropological sense] is all-pervasive" (1989).

But just how broad should the anthropological definition of culture be? Kroeber and Kluckhohn's formulation was cumbersome in part because it was so inclusive. It called on anthropologists to study not just other people's beliefs (their ideas of what the world is like) but also other people's normative standards (their ideas of what is good and what is right). It called on anthropologists to study not just the explicit 'ethnosciences' and doctrinal moral and religious codes of the members of a community but their tacit, implicit, or intuitive understandings as well.

Anthropologists have long disagreed about whether patterns of behavior should be considered a part of 'culture.' Margaret Mead employed a definition that centered around a 'complex of behavior.' David Schneider, on the other hand, went so far as to suggest that even norms for behavior should be excluded from cultural analysis. As Schneider put it: "norms tell the actor how to play the scene, culture tells the actor how the scene is set and what it all means" (1968).

With their definition, Kroeber and Kluckhohn sought a middle course between the *Scylla* of a purely behavioral definition of culture and the *Charybdis* of a purely ideational one. On the one hand, Kroeber and Kluckhohn suggest that culture is more than just social habits or "patterns of behavior that are learned and passed on from generation to generation." On the other hand, it is not just a system of categories, doctrines, propositions, or symbols per se. Thus in the 1952 definition, culture is defined as the ideational side of social action or social practice, and anthropologists are called upon to view cultural analysis as the interpretative study of behavior, although rather little is said about what particular theory of interpretation should guide the analysis.

Useful definitions deserve to be expressed in elegant terms, and Kroeber's and Kluckhohn's definition of culture is cumbersome, to say the least. But it is not the only expression of the standard view. The most exquisite and straightforward formulation is Robert Redfield's definition: "conventional understandings manifest in act and artifact" (Redfield, 1941, p. 133). Another variation, perhaps the most famous definition of culture since the 1950s, is the one proposed by Clifford Geertz (1973, p. 89). He puts it this way: "…the culture concept…denotes an historically transmitted pattern of meanings embodied in symbols, a system of inherited conceptions expressed in symbolic form by means of which men communicate, perpetuate, and develop their knowledge about and attitudes towards life."

The definitions proposed by Kroeber and Kluckhohn, Redfield, and Geertz call out for specification and clarification. Nevertheless, those definitions are a good reference point for understanding current debates about the values and dangers associated with the very idea of 'culture.' One can summarize the standard view by saying that 'culture' refers to community-specific ideas about what is true, good, beautiful, and efficient. To be 'cultural' those ideas about truth, goodness, beauty, and efficiency must be socially inherited and customary. To be 'cultural' those socially inherited and customary ideas must be embodied and/or enacted meanings; they must actually be constitutive of (and thereby revealed in) a way of life. Alternatively stated, the standard North American anthropological view of 'culture' refers to what the British philosopher Isaiah Berlin (1976) called "goals, values and pictures of the world" that are made manifest in the speech, laws, and routine practices of some self-monitoring and self-perpetuating group. These 'goals, values and pictures of the world' or 'ideas about what is true, good, beautiful, and efficient' are sometimes referred to as 'cultural models' (D'Andrade, 1995a; Holland and Quinn, 1987; Shore, 1996).

Fault Lines in Contemporary Anthropology

The 'standard' North American anthropological view of culture was synthesized and defined by Kroeber and Kluckhohn before the discipline went through a series of revolutions and movements that fractured the field and divided it on the basis of somewhat different visions of its mission. Contemporary views of 'culture' reflect those divisions to some extent. Thus, while it may be hazardous to propose a map of the current intellectual camps within cultural anthropology, such a map may also be helpful in understanding the various types of anticultural, postcultural, and procultural positions that have emerged within anthropology over the past 50 years.

It is fair to say that contemporary cultural anthropology is divided into at least these four conceptions of the field.

Identity Politics

The first is a conception of anthropology as a platform for moral activism in the battles against racism, sexism, homophobia, and neocolonialism and as a forum for identity politics in the fight against exploitation, discrimination, and oppression. Advocates of this conception of anthropology have several concerns about the idea of 'culture.' They argue that the idea of culture is an excuse for the maintenance of authoritarian power structures and permits despots and patriarchs around the world to deflect criticism of their practices by saying 'that is our custom' or 'that is the way we do things in our culture' (see Abu-Lughod, 1991; Said, 1978; Scheper-Hughes, 1995; Wikan, 1995). The claim by liberal 'first-world' feminists that 'multiculturalism is bad for women' (Okin, 1999) is an expression of this view, which tends to associate 'culture' with the idea of patriarchal domination (Haynes and Prakash, 1991; Raheja and Gold, 1994). This conception of the mission of anthropology is closely allied with a global human rights movement that has promoted the notion of 'harmful traditional practices' and has a firm sense of what is objectively and universally right and wrong (see Sabatello, 2009).

However, not all moral activists in anthropology want to dump the idea of culture. Some have found ways to put the idea to work in the service of their own political aims. Anthropologists who are active in the identity politics movement find the idea of culture politically and strategically convenient in their egalitarian battles on behalf of 'oppressed peoples.' There are generally three ways to mitigate invidious comparisons between groups (as in, group comparisons of wealth, occupational attainment and success, or school performance): (1) deny that any real differences exist, (2) attribute all differences to a history of oppression or discrimination, or (3) celebrate the differences as 'cultural.' In the identity politics movement, 'culture' has become something of a code word for 'race' and ethnic minority status.

Skeptical Postmodernism

The second conception of the mission of anthropology is a conception of the field as a deconstructive discipline and as an arena for skeptical postmodern critiques of all ethnographic representations and so-called 'objective' knowledge (see for example, Clifford and Marcus, 1986; Latour and Woolgar, 1979; Rabinow, 1983; Foucault, 1973; Rosenau, 1992). Advocates of this conception of anthropology call for a deeply skeptical reading of all anthropological representations of 'others,' especially of those accounts that make claims about some 'primordial' or essential or core cultural identity which members of some group are supposed to share. The skeptical postmodernists raise doubts about the reality and existence of identifiable cultural groups. They are critical of all attempts to draw a portrait of 'others' that represents them with any characteristic face. They are suspicious of the very idea of boundaries and borders and loyalties to one's historical ethical in-group or 'tribe.' They view the idea of a 'culture' as a fiction, the goal of objective representation as misguided, and the products of ethnography as largely 'made up' or constructed in the service of domination.

One of the many ironies of contemporary anthropology is that for a while members of the first two camps of anthropology (the identity politics/moral activists and the skeptical postmodern/deconstructivists) thought they were allies. Indeed, they had an imagined common enemy: the hegemonic heterosexual 'first-world' white males, such as Kroeber, Kluckhohn, Redfield, and Geertz, who historically had defined the mission of cultural anthropology.

For the most part, the alliance was short-lived. Identity politics requires a robust notion of 'identity' and group membership. Moral activism requires a good deal of conviction about the existence of an objective moral charter (such as inalienable human rights) and is typically motivated by the view that some cultural customs or social norms are 'objectively wrong'. Skeptical postmodernism is intellectually incapable of lending support to either of those metaphysical notions and is readily put to use deconstructing the 'woman' of 'Women's Studies,' the imagined common identity of the ethnic group, and all supposed objective moral foundations for any political cause. Paradoxically, continued attempts to reconcile identity politics with postmodern skepticism (e.g., Scheper-Hughes, 1995; Abu-Lughod, 1991) produce a moralizing model in which all forms of generalization and representation are doubted and distrusted *except* for domination and oppression, which are privileged as a priori objective truths or categories of moral condemnation (D'Andrade, 1995b).

Neo-Positivism

A third conception of the mission of anthropology is a conception of the field as a pure 'positive' science (see for example, D'Andrade, 1995a,b, 2008; Kronenfeld et al., 2011; Sperber, 1985; Romney et al., 1986). The positive scientists view anthropology as a value-neutral and nonmoralizing discipline. Their preferred aims for the discipline are to reliably and validly represent the law-like patterns in the world and to develop universal explanatory theories and test specific hypotheses about objectively observable regularities in social and mental life. Advocates of this conception want to protect anthropology from identity politics and skeptical postmodern critique by accurately recording rather than judging and condemning other peoples' practices, and by developing objective or scientific standards for evaluating the truth of ethnographic evidence. This is a laudable aim, although one that has been contested by skeptical postmodernists, and there has been much useful work in neopositivist fields such as 'cognitive anthropology' representing the content, structure, and degree of sharing of 'cultural models' (see, e.g., D'Andrade, 1995a; Holland and Quinn, 1987; Kronenfeld et al., 2011; Romney et al., 1986). Nevertheless, the positive scientists in anthropology thereby tend to beg a critical question close to the heart of all great social theorists. Is this or that social order really a moral order? Is this or that social order a way of living that might appeal to a rational and morally sensitive person, and if not

how can we make it become so? When it comes to evaluating what is truly desirable or really 'good' in social life the neopositivists are very much like the skeptical postmodernists – both turn radically subjective or relativistic and believe there is no scientific or objective foundation for the value judgments made in different traditions of value or historical ethical communities, aside from reporting their potential adaptive value in promoting group cohesiveness and survival.

Romantic Pluralism

A fourth conception of the mission of anthropology is a conception of the field as a romantic discipline designed to test the limits of pluralism. Pluralism is the idea that things can be different but equal, and that diversity can be good. It is a measure of some of the tensions within contemporary anthropology that while the 'ethnography of difference' is viewed with suspicion by some of the anticulturalists, it is universally embraced by romantic pluralists. Anticulturalists worry that any description of cultural difference merely sows the seeds of invidious comparison and ethnic conflict, and thus should be disavowed. For the romantic pluralists, however, the recognition and appreciation of cultural differences is one of the major aims of ethnography in particular and cultural anthropology in general.

The intellectual inheritance of the 'romantic' tradition most relevant to this camp of anthropology is a conception of culture as an extension of the creative imagination of agents who possess the capacity to initiate actions and evaluate their consequences with respect to some conception of what is dignified, divine, moral, or 'good,' which many anthropologists believe are distinctive intellectual capacities of human beings (see Geertz, 1973; Sapir, 1963; Sahlins, 1995; Shweder and LeVine, 1984; Shweder, 1991). According to romantic pluralists, a culture is an historical moral community whose social norms and customs make manifest and give expression to metaphysical notions about what is true and ideas about which values and forms of social organization are of greater value. Those notions and ideas provide members of the moral community with good reasons for action within their own terms, although they are not strictly dictated by logic and do not arise directly from (meaning-free) experience. According to this romantic pluralist conception of culture, there is plenty of room within the limits of logic and experience for cultural variety, and for the historical creation of different lived conceptions of what it means to be a rational and moral human being. According to this view, social and cultural realities are neither logically deduced nor simply found in direct experience but are rather constructed by, and for, more or less rational agents. The human creative imagination has the capacity to fill in, and give definition to, a vast discretionary space that stretches in between the necessary truths of formal logic and the uninterpreted evidence of the senses. Advocates of this conception of anthropology are dedicated not only to the project of accurate ethnographic representation but also to the cognitive and moral defense of different ways of life, frames of reference, and points of view. They write books or articles about Azande Witchcraft (Evans-Pritchard, 1937) or Balinese conceptions of the 'person' (Geertz, 1973) or Oriya Hindu family life and gender relations (Menon and Shweder, 1998) or Egyptian Muslim female conceptions of piety and 'the feminist subject' (Mahmood, 2005) which portray the ideas and practices of others as different but equal to our own, in the sense that such ideas and practices are represented as meaningful and imaginative yet supportable within the broad limits of scientific, practical, and moral reason (see also Haidt, 2012).

A Fifth Camp within Anthropology? The Return of Cultural Developmentalism and the 'First-World's' Burden

Increasingly these days, as the world 'globalizes,' the concept of 'culture' gets used to explain differences in the economic, social, political, educational, and moral accomplishments of nations, groups, or peoples. An 'evolutionary' or 'developmental' view of culture has returned to the intellectual scene. Along with it comes the claim that some groups have the wrong models, the wrong values, the wrong patterns of behavior, and that is the reason that their economies are poor, their governments corrupt, and their people unhealthy, unhappy, and oppressed. The cultural developmental view of cultural differences was quite popular at the very beginning of the twentieth century, and is associated with the 'civilizing project' or the 'white man's burden' to uplift those who are ignorant, superstitious, primitive, savage, and poor. Quite remarkably, the cultural developmental view is increasingly popular at the beginning of the twenty-first century as well, especially outside of anthropology, for example, in economics and political science (Harrison and Huntington, 2000; Landes, 1998; see Shweder, 2011, 2012). For some economists, reference to social and cultural 'capital' provides the basis for a less atomistic methodological individualism still grounded in rational choice theory but sensitive to the role of 'social structures' in everyday decision-making (Coleman, 1988). In development economics, however (e.g., at the World Bank), the view that 'culture counts' or that 'culture matters' is now popular in part because it is a discreet way of telling 'underdeveloped' nations (either rightly or wrongly) that the 'Westernization' of their cultures is a necessary condition for economic growth. Cultural developmentalists want to convert others to some preferred superior way of living. Their aim is to eliminate or at least minimize the differences between peoples rather than tolerate or appreciate them as products of the creative imagination. This viewpoint has returned, at least implicitly, in anthropology as well, especially among moral activists.

Relatively few anthropologists would actually describe themselves as cultural developmentalists. Nevertheless, that stance is far more common in anthropology than many admit, especially when the topic concerns gender relations and family life practices, for example, polygamy, purdah, arranged marriage, burqas, bride-price, female circumcision, and the association of femininity with domesticity and the production of children. So along with the international human rights movement and other agents and agencies promoting Western-style globalization, there are anthropologists these days who now take an interest in other

cultures mainly as objects of moral scorn. The up-from-barbarism theme of (certain versions of) Western liberalism has once again become fashionable on the anthropological scene (see Boddy, 2007; Sabatello, 2009; Thomas, 2003).

Multiculturalism and the Problem of 'Difference'

One tension inherent in all anthropological interpretation is the problem of 'difference,' what to make of it and what to do about it. This is also called the problem of the 'other,' although the term 'other' is used variously in the anthropological literature. It is sometimes used to connote difference per se without any initial judgment of relative worth. It is sometimes used to connote unbridgeable differences. It is sometimes used to connote a solipsistic gap between self-knowledge and a mysterious or 'spectral other' whose identity can never be truly inscribed. It is sometimes used to connote the representation of 'others' as so different as to be less than or other than human, or as different in ways that condemn them to inferior status and/or justify their domination. Here we use the term to connote difference per se.

The problem of 'difference' inherent in anthropological interpretation is not just a problem for anthropology. It arises whenever members of different groups (e.g., Jesuit missionaries and Native North American Indians; British traders and Hindu Brahmans; Western feminist human rights activists and Islamic fundamentalist women) or members of different social categories (e.g., gay men and heterosexual men) encounter each other. Someone finds the encounter disturbing, puzzling, strange, or astonishing because of some apparent difference between self and 'other' and wants to know what to make of it and (if they have the power) what (if anything) to do about it.

In the history of anthropology, the apparent differences mostly concerned differences in the ideas and practices of members of different groups. But in recent decades, globalization and large-scale immigration have intensified the challenge of cultural diversity within liberal democracies (Hechter, 2000). In this context, the term 'multiculturalism' has become a slogan for many rather different and even contradictory sorts of educational and social movements and public policy agendas.

There are multiculturalists who value group differences and want to preserve them. There are other multiculturalists who think group differences are the product of vicious discrimination. There are multiculturalists who think that the word 'multiculturalism' means being a hybrid and actively promoting the erosion of borders or boundaries between groups. There are other multiculturalists who think the word implies autonomy, in-group solidarity, the power to remain separate or pure, and the capacity to maintain boundaries or restore a distinctive way of life.

There are multiculturalists who use the word in an almost ironic sense to commend and promote the mainstreaming, assimilation, integration, or inclusion of people of different colors or ancestries into the society and shared subculture of the American elite; and there are others who use the term to call on the mainstream elite to accommodate themselves to minority-group differences in customs, values, and beliefs.

One suspects that in each of these cases there is a slightly different concept of 'culture' at work. But we cannot avoid the question, what form does and should multiculturalism take in our emerging postmodern society? (see Shweder et al., 2002; Minow et al., 2008; Shweder, 2011).

Globalization

The narrowest definition of 'globalization' refers to the linking of the world's economies (e.g., free trade across borders) with the aim of promoting aggregate wealth and economic growth. Yet it readily expands so that a new cosmopolitan economic order gets imagined, which consists entirely of global economic organizations (the International Monetary Fund, the World Bank), multinational corporations, and multicultural states with open borders. According to this rather utopian vision of a 'borderless capitalism', goods, capital, and labor ought to be freely marketed on a world-wide scale for the sake of global prosperity. For those who adopt such a perspective any desire for an ancestral homeland or for a national identity based on religion, ethnicity, 'race,' or 'tribe' with associated restrictions on residence, affiliation, and trade is viewed as 'illiberal' and disparaged as a form of retrograde or irrational 'apartheid' or 'ethnonationalism.'

Fully expanded, however, the idea of 'globalization' actually becomes a hypothesis about human nature and an imperial call for 'enlightened' moral interventions into other ways of life in order to free them of their supposed 'barbarisms,' 'superstitions,' and 'irrationalities.' This expansive 'globalization hypothesis' makes three related claims: (1) that Western-like aspirations, tastes, and ideas are objectively the best aspirations, tastes, and ideas in the world; (2) that Western-like aspirations, tastes, and ideas will be fired up or freed up by economic globalization; and (3) that the world will/already has and/or ought to become 'Westernized.' Western-like aspirations include the desire for liberal democracy, free enterprise, private property, autonomy, individualism, equality, and the protection of 'natural' or universal 'rights.' They include the modernist notion that all social distinctions based on collective identities (ethnicity, religion, gender) are invidious. They include as well the notion that 'individuals' should transcend their 'tradition-bound' commitments and experience the quality of their lives solely in secular and ecumenical terms, for example, as measured by, wealth, health, or years of life.

The picture of a cosmopolitan world of individuals without groups, in which meanings are detached or abstracted from communities and traded on a free market of ideas, has influenced the thinking of some postcultural theorists. Whether that picture is realistic remains to be seen. It is quite possible that other cultures and civilizations do not need to become just like the United States to materially benefit from participation in an emergent global economy. Modern economic institutions such as private property seem to have effectively served many interests, including the interests of communitarians as well as religious and ethnic groups all over the world (Stolzenberg, 2004). As Comaroff and Comaroff have pointed out, even the outright commercialization of cultural identity – be it in the form of tangible commodities (e.g., souvenirs and

'indigenous crafts'), collective business ventures (e.g., Native American 'tribal' casinos), or 'cultural tourism' – does not necessarily erode genuine difference, but can instead provide a mode of reaffirming and refashioning ethnic identity (Comaroff and Comaroff, 2009).

The true connection between 'globalization' narrowly conceived ('free trade') and 'globalization' expansively conceived (Western values, 'culture', and institutions taking over the world) has yet to be firmly established (see Shweder, 2011). Is this truly the 'end of history' as Francis Fukuyama (1989) once proposed? Or, as in Samuel Huntington's thesis, will great divisions among humankind inevitably spring up along 'cultural fault lines' and lead to a clash of civilizations? (Huntington, 1996). Huntington's description of those fateful cultural differences – 'fundamental,' intractable, the 'product of centuries' – bears striking resemblance to Clifford Geertz's description of 'primordial sentiments' (Geertz, 1963), seen here stubbornly resisting the onslaught of globalizing and 'westernizing' forces. Nevertheless, the idea that the rich nations of North America and Northern Europe have an obligation to use their economic and military power to civilize and develop the world is no less popular today than it was 100 years ago when the empire was British rather than 'neo-liberal' or American.

'Culture': Popular Objections and Common Misattributions

Within anthropology many reasons have been advanced for doubting the usefulness of the culture concept. But are they persuasive or decisive reasons? Those who continue to embrace some variety of the Kroeber and Kluckhohn definition of culture tend to believe that their idea of culture does not carry most of the implications that are the supposed grounds for various anticultural or postcultural critiques.

For example, the Kroeber and Kluckhohn definition of culture does not really imply that 'whatever is, is okay,' nor does it necessarily share in the view expressed by some moral relativists that morality is just a convenient term for socially approved habits (e.g., Benedict, 1934). It is important to recognize that valid social criticism and questions of moral justification are not ruled out by the standard anthropological view of 'culture.' Nothing in the Kroeber and Kluckhohn formulation suggests that the things that other peoples desire are in fact truly desirable or that the things that other peoples think are of value are actually of value. Consensus does not add up to moral truth. In other words, a definition of culture per se is not a theory of the 'good.' From a moral point of view one need not throw out the idea of culture just because some tyrant puts the word 'culture' to some misuse, or because at times some ethnic groups enter into geopolitical conflict (see Shweder, 2012).

The idea of culture also does not imply passive acceptance of received practice or that human beings lack 'agency,' a common claim among anticulture theorists. Indeed, many proculture theorists find it astonishing to see the idea of 'agency' or 'intentionality' used as synonyms for 'resistance to culture' in the discourse of 'anticulture' theorists. Even fully rational, fully empowered, fully 'agentic' human beings discover that membership in some particular tradition of meanings and values is an essential condition for personal identity and individual happiness. Human beings who are 'liberationists' are no more agentic than 'fundamentalists,' and neither stands outside some tradition of meaning and value.

The idea of culture also does not imply the absence of debate, contestation, or dispute among members of a group. Nor does it necessarily imply the existence of within-group homogeneity in knowledge, belief, or practice. Every cultural system has experts and novices; one does not stop being a member of a common culture just because cultural knowledge is distributed and someone knows much more than you do about, for example, how to conduct a funeral or apply for a mortgage. One does not stop being a member of a common culture just because there are factions in the community. The claim that there are between-group cultural differences never has implied the absence of within-group differentiation. The idea of culture does not imply that every item of culture is in the possession or consciousness of every member of that culture. The idea of culture merely directs our attention to those ideas about what is true, good, beautiful, and efficient that are acquired by virtue of membership in some group. Members of a cultural community do not always agree about this or that, but they do take an interest in each other's ideas about what is true, good, beautiful, and efficient because those ideas (and related practices) have a bearing on the perpetuation of their way of life, and what they share is that collective inheritance. Since the standard view does not assume that a culture is a well-bounded, fixed, and homogeneous block, the critique of the concept of 'culture' that starts with the observation of internal variation and ends 'therefore there is no cultural system' should have been a nonstarter.

In its noun form, 'culture' can either be countable (as in *a* culture or 'Japanese culture') or uncountable (denoting culture in the abstract sense as a domain of knowledge or inquiry). The conflation of the two senses is one of the main sources of confusion and misattribution in critiques of the idea of culture. Often, critics purport to take aim at the broader concept of 'culture' while fashioning arguments relevant only to its particular usage in the plural form ('cultures'). The historian of anthropology George Stocking identified the popularization of the plural use of 'cultures' by Franz Boas and his students in the 1930s and 1940s as a crucial turning point, after which the problematic modern notion of cultures as static, bounded entities gained traction. Anticipating contemporary critiques, Kroeber and Kluckhohn (1952) defended the practice of speaking of 'cultures' in the plural as a useful abstraction, pointing out that one could speak at the same time of a Tokyo or a Japanese or an East Asian culture without implying that any of them represented a homogeneous or totalizing way of life.

Just as relevant to contemporary anthropologists' feelings about the concept of 'culture,' however, is the manner of the term's deployment in ordinary language. 'Culture,' as William Sewell tells us, "has escaped all possibility of control by anthropologists" (2005, p. 155). It has become 'compromised' (Clifford and Marcus, 1986). More and more, everyone from policymakers to activists, educators to demagogues seem intent to (affectionately) portray 'cultures' as bounded, uniform, unchanging, and primordial. Such connotations are enough to send cautious anthropologists into flight.

Faced with this misappropriation of what was once their term, anthropologists have generally responded in one of two ways: (1) by substituting terms like 'discourse' or 'habitus' for 'culture' in the hopes of avoiding some of the latter's unsavory connotations (it is never clear if this 'lexical avoidance behavior' avoids the supposed sins of 'culture' or merely reproduces them in a new guise); or (2) by restricting themselves to the adjectival use of the term: instead of 'culture' or worse yet, 'cultures,' anthropologists speak of 'cultural tradition,' cultural practice, 'cultural capital,' and so on (see Appadurai, 1996; Brightman, 1995). The latter tactic is best summed up in the title of Michael Silverstein's (2005) essay, which also does a good job of capturing both the ambivalence and the urgency of contemporary anthropologists' attitudes toward 'culture': "Languages/cultures are dead!" Silverstein exclaims, "Long live the linguistic-cultural!" Nevertheless, many social scientists and public policy analysts continue to look to anthropology for a useful concept of culture and not for no concept of culture at all.

Culture of Poverty: Critique

Abstract

This article recounts the historical, theoretical, and empirical basis of the culture of poverty program as it was developed in the writings of Oscar Lewis and examines the anthropological critique of his work that developed immediately upon the heels of Lewis' final publications. Further, this article examines the recent emergence of the culture and poverty program and notes its confluences with and points of departure from the culture of poverty program.

In 1966, the anthropologist Oscar Lewis published an article titled 'The Culture of Poverty.' There, Lewis developed and systematized a way of analyzing what happens to people in poverty. He claimed that many poor people were poor because their parents had passed onto them various traits and habits that keep people in poverty. Also, he suggested that governmental policies might break what was also known as the 'cycle of poverty.' This way of looking at people in poverty, in its moral, intellectual, and political implications, has a very long history, but Lewis' formulation caught the attention of the public and remains as a kind of litmus test in all research on poverty. In 1966, policy makers in Washington were putting the final touches on the set of programs known as the 'Great Society.' They were driven by a complex political imperative. As John F. Kennedy put it in his inaugural address: "Man holds in his mortal hands the power to abolish all forms of human poverty" (20 January 1961). This begged for an overarching narrative grounded in the behavioral sciences. Researchers from all disciplines proposed lists of traits that appeared to make the poor different, and suggested that those traits might be alleviated through various interventions. Lewis brought all this together under the heading of 'culture' taken in what was then the most common sense version of the concept. He appeared to offer a compassionate theory of poverty that confirmed the wisdom of the Great Society programs and suggested how they might be expanded and refined as the United States kept fighting what was also known as the 'War on Poverty.' The anthropological reaction against this theory was swift and severe – but, to this day, new versions keep appearing under new guises.

While the phrase 'culture of poverty' is firmly associated with Oscar Lewis' work, as well as with the policies of the Johnson era, it can easily be placed in a long tradition of conceptualizing the poor and imagining policies to help and control them. In the eighteenth and nineteenth centuries, Malthus and Mayhew had provided the intellectual justification for viewing poverty as a problem to be controlled (Himmelfarb, 1971, 1983). They developed many of the methods and starting points later embraced by Lewis. This included descriptive statistics of the distribution of 'traits' (rate of prostitution, alcoholism, unwed motherhood, etc.) across populations and correlations often interpreted as causations. This paralleled much nineteenth-century social theory purporting to explain other differences in human populations on biological or evolutionary bases.

Lewis' conception of culture also built on a long tradition and it made common sense in an American context heavily influenced by culture and personality studies, as well as by the Parsonian attempt to bring together sociology, anthropology, and psychology in a grand theory of action (Parsons and Shils, 1951). Talcott Parsons was at the time the most powerful sociologist in America who, as the founder of the interdisciplinary Department of Social Relations at Harvard, trained many influential social scientists of the following generation. The Parsonian sense of culture as what is learned, valued, and transmitted from one generation to another may actually marked a significant departure from the Boasian origins of the use of the term in the anthropology he advocated. Boas founded at Columbia University the first modern academic Department of Anthropology in the United States, and he trained many of the most influential anthropologists of the 1930s, 1940s, and 1950s. He had proposed 'culture' as a way to force attention to the processes that distinguish populations from each other even when living in very similar ecological environments with similar technologies (Trouillot, 2003: 91). But many of his students, and even more of his students' students, including Lewis, transformed 'culture' into the possession of a population. It was made to refer to whatever shapes personalities, that is then inscribed in the personality of most member of the population, psychologically, through internalization whether phrased as 'enculturation' or 'socialization.' Many argued that this process could be so complete as to render people unable to imagine other possibilities than those proposed by 'their' culture. The process would lead them to reproduce their conditions in future generations unless external forces intervened. This emphasis on internalization of social and cultural patterns was further systematized by Parsons who argued powerfully that culture is mostly a 'value' concept referring to internal states (Parsons and Shils, 1951: 159–160).

Soon after Lewis' synthesis was published, intellectual opposition to this systematization arose, particularly among cultural anthropologists (Valentine, 1968; Leacock, 1971). By using the preposition 'of' to link culture and poverty, and by arguing that the poor are caught in a culture that they reproduce in their children, Lewis encouraged those who imagined that alleviating poverty had to proceed through reforming the poor, and particularly their children. Soon, the opposition started to argue that accepting culture of poverty framework

 http://dx.doi.org/10.1016/B978-0-08-097086-8.64091-6

amounted to 'blaming the victim' and, in a few years, the phrase became a mark of opprobrium.

The overall argumentation, however, did not disappear, though it is now sometimes couched in different terms. In recent years, William Julius Wilson (2009, 2012[1987]), among others (Furstenberg et al., 1999), has argued for a return to at least some of the lines of investigation Lewis had put forth. The critique of these lines of investigation is also being renewed particularly by anthropologists who have distanced themselves from the concept of culture, as well as by those who are working at recapturing the original Boasian concerns with establishing that, among human beings, like causes, such as 'poverty,' do not necessarily lead to like effects.

This article is organized into seven sections. Beginning with a historical overview of precursors to the 'culture of poverty' program, the sections move chronologically toward the contemporary state of research and critical engagement relating poverty to culture.

Poverty and Policy: Some Historical Background

The Elizabethan Poor Laws of 1601, later carried from England to America (Katz, 2011: 11–16), divided the poor into three categories: those who could not work, those who could work but choose not to, and those who are willing to work. The Poor Laws mark the point at which religious duty toward the poor gave way to legally sanctioned relations. Two centuries later, in his *An Essay on the Principle of Population* (2003 [1798]), Thomas Robert Malthus theorized that there was a relationship between population and economy, but social position between the two was static and thus, whatever happened in the broad economy, the poor would be left mired in 'misery and vice.' Malthus opposed Adam Smith's argument that the spread of capitalism would lead to an improvement in the well-being of all, as national wealth increased (Himmelfarb, 1983). Malthus countered that the population principle would prevent this from happening because population expands to fit available resources. This produces a stress on these resources so that poverty would remain and a class of people would occupy the position. Malthus also inquired into the mechanism by which the population is sorted into successes and failures. His answer is that those at the bottom of the economic ladder remained there because they lacked the qualities of economic superiors; namely moral restraint in the form of vice, drunkenness, and sexual promiscuity, as well as the inability to discipline themselves to foresee and save for the future (Himmelfarb, 1983: 119).

Malthus's work entered the world of nineteenth century public policy in various ways. Mayhew, a journalist, took to the streets of London to observe and describe the types of poor people then living on the streets of London. He did this through a variety of methodological tools such as maps, biographies, and observation. More importantly, he applied the tools of storytelling to exaggerate his observations toward evoking pathos in his readers. Mayhew's (1986[1850]) book is filled with ethnographic vignettes and statistics linked to area maps aimed at showing the intensity of crime, ignorance (illiteracy), and illegitimacy. He provided a further warrant to novelistic accounts of poverty by Dickens and others. All this led to new laws and programs. To quote Himmelfarb: "It is one of the many ironies of the period that just at the time the poor were finally relieved of the stigma of pauperism, when they seemed to be following the model laid down by Adam Smith rather than that of Malthus, Mayhew came along and, with the most laudable intentions and the most generous of sympathies, inflicted upon the poor a new stigma and saddled society with a new problem, the 'culture of poverty'" (Himmelfarb, 1984: 370). Karl Marx himself, if one accepts Rancière's interpretation (2004[1983]), may have contributed to this view of the poor as caught in their position. On the one hand, Marx was suspicious of the labor unions emerging from the poor in England. On the other hand, he reserved for intellectuals a particular place in the enlightenment of the proletariat.

The Culture Concept from Boas to Lewis

The nineteenth century also saw the first definitions of the culture concept as it came to be used by anthropologists. As Edward Tylor put it: "Culture … is that complex whole which includes knowledge, belief, art, law, morals, custom, and any other capabilities and habits acquired by man as a member of society" (2004[1871]: 1). A century later, Lewis issued a definition of culture somewhat consistent with Tylor's definition – though slanted in a more psychological direction. As Lewis put it: "The culture of poverty is not just a matter of deprivation or disorganization, a term signifying the absence of something. It is a culture in the traditional anthropological sense in that it provides human beings with a design for living, with a readymade set of solutions for human problems, and so serves a significant adaptive function" (Lewis, 1966). At about the same time, the most powerful anthropologist of his generation, Clifford Geertz, wrote that 'culture' is both 'model of' and 'model for' behavior (Geertz, 1973[1966]: 93).

This view of culture has now been thoroughly critiqued (Abu-Lughod, 1991; Ortner, 1999) but, even at the time, it represented a significant departure from an earlier version developed by Franz Boas. Boas was trained in physics and geography but moved away from these fields when he started working with the people of the Pacific Northwest and curated ethnographic collections at the Smithsonian and the Museum of Natural History. There, he began to debate with others over the display of ethnographic artifacts and, indirectly, about the human activities that produced these artifacts. J.W. Powell, McGee, and Mason were convinced that primitive people came to adopt more evolved ideas, materials, and processes through a process of social evolution in which the environment strictly determined social development. Following this principle led Mason to argue for the display of ethnographic artifacts in term of evolutionary phases following the logic that, in human affairs, as in nature, like-causes lead to like-events. Boas opposed this. He argued that "due to the intricacy of the acting causes" (Boas, 1887: 485) in human action, it was unlikely that like causes could be established and used for drawing broad generalizations and "the disposition of men to act suitably can be the only general cause." This led him to argue, successfully, for the display of artifacts in the context of their use among a particular people, at a particular time in their history.

After Boas moved to Columbia University, he developed this perspective in his research and argued forcefully and systematically against all those who interpreted culture as the inevitable properties of people caught in various conditions. For him, culture referred to processes of ongoing adaptation to local conditions. Boas emphasized that people of all backgrounds can adapt to any setting if they must, or allowed to (1938[1911]). He demonstrated that people could adapt differently to very similar conditions. This style of argumentation was echoed in a letter, Conrad Arensberg wrote to Oscar Lewis. Lewis had written to Arensberg that "poverty, and all that goes with it, is literally stable, persistent, and passed down along family lines. Can all the many cross cultural similarities I have mentioned been the result of accident or coincidence?" Arensberg answered: "The reactions to poverty are many: Middle Eastern, Arab austerity, Puritan frugality, Chassidism, the lazzaroni of Naples, etc. This shows that poverty, even with urbanization, does not produce similarities of culture …" (Rigdon, 1988: 226) In other words, very similar causes (material deprivation, political discrimination, disease, etc.) lead to very different kinds of adaptations.

Lewis' Intellectual Milieu

Lewis was a product of Columbia's anthropology department, at a time when the department was in transition from the Boasian paradigm as it had evolved to concerns with cultural ecology and multilineal evolution. At Columbia, Lewis studied with Ruth Benedict but also took courses on technology, archaeology, etc. (Rigdon, 1988: 12). In 1939 Lewis, and his wife and frequent collaborator Ruth, were one of four field teams organized by Benedict to carry out a comparative and historical study in the Blackfoot Reservation. This led to Lewis' dissertation on "The Effects of White Contact upon Blackfoot Culture, with Special Reference to the Effects of the Fur Trade" (1943). The dissertation was not based on field research but rather on the analysis of historical documents. But it does echo the tension that characterized Lewis' work throughout his career: the concern with economic interaction between unequal groups, and the consequences of this interaction.

In 1944, and again in 1947, Lewis spent several months in Tepoztlán, a large village in Mexico, the beginning of a series of field investigations in the country. Lewis' subsequent work came to focus more on the psychological consequences of life in difficult economic conditions, and less on the social and political processes that produced difficult conditions. In his first book (1960[1951]), Lewis distinguishes his work from earlier work by Robert Redfield on the same village (1930), emphasizing that life in the village could not be understood except in terms of the political history of the village through the Mexican revolution, the Spanish colonization, and back to pre-Columbian. He lists the governmental agencies that controlled the village, expands on its political organization, and traces differences in wealth and land ownership. He also wrote about the impact of all this on interpersonal relationships, particularly in families. He concludes with comments on the relationship of his work to the discussions of 'culture and personality' that most concerned many influential anthropologists at the time and notes that "I have not written about *the* Tepoztecan personality" (1951: 426). But his interest in the issue remained and led him to focus on families as the unit of analyses and entry point for gaining "greater insight into both the culture and the people" (Lewis cited in Rigdon, 1988: 34). This turn, as well as his admiration for such major figures in the late versions of culture and personality theorizing as Erik Erickson and Jules Henry, took him to the formulation of the culture of poverty for which he remains best known.

The Policy Context of the 'Culture of Poverty'

When Lewis wrote his paper in the Scientific American, a still somewhat obscure Assistant Secretary of Labor, Daniel P. Moynihan, was asked to write a report making the case for federal policies to 'resolve a problem' he summarized as follows: "Three centuries of injustice have brought about deep-seated structural distortions in the life of the Negro American. At this point, the present tangle of pathology is capable of perpetuating itself without assistance from the white world. The cycle can be broken on if these distortions are set right [through a national effort directed toward the question of family structure]" (Moynihan, 1965: 47).

This report quoted extensively from E. Franklin Frazier's *The Negro Family in the United States* (1966[1939]) and used the book as justification. The foreword to the third edition, also published in 1966, was written by the famous sociologist Nathan Glazer who dismissed what he called the "cultural relativism and anthropological romanticization" associated with Allison Davis who had also written about black life in the postreconstruction South (1941). Glazer writes: "Frazier I think was more hardheaded, … as was W.E.B. Du Bois: It was all bad – the abandoned mothers, the roving men, the sexually experienced youth" (1966: xi). Glazer emphasized that much of what Frazier had written was supported by contemporary social science, including anthropology: "The family itself was the support of the social structure. Children were socialized into certain values … and they maintained a society" (Glazer, 1966: ix). This statement may be closer to Parsons than to the anthropologists, Glazer mentions. And he does not mention the Chicago sociologists who had trained Frazier and who would also have encouraged him toward social psychological explanations of individual behavior.

The statement was also close to statements by others hailing from other disciplines. In 1962, Michael Harrington's published a book, *The Other America: Poverty in the United States*, an examination of poverty in the Appalachian region of the United States. Stylistically, Harrington shared with Lewis and Mayhew a depiction of the poor as being both structurally and culturally deprived. Like Lewis, Harrington was moved by a moral and political concern with changing the conditions of the poor that had to proceed through the political activities of the more privileged. Social psychologists (Deutsch, 1960) came to the issue from slightly different perspectives. Linguists also provided evidence (Bereiter and Engelmann, 1966; Bernstein, 1962, 1965). All talked about deprivation, developmental delays, etc., and wrote about the effect of all this on school success, which could then be used as a proxy for the evaluation of the social costs of poverty and the effectiveness of various policies. The method was systematized in the *Equality of*

Educational Opportunity Study (2007[1966]), generally known as the 'Coleman Study,' commissioned by the United States Department of Health, Education, and Welfare in 1966 and parallels the Moynihan report by also emphasizing the role of families over the role of schools in the measure of schooling success. To this day, this method remains the main entry point in the operationalization of poverty and its effects, as well as the means to measure the effectiveness of government policies. The ensemble of political concerns crystalized through the Civil Rights movement, given an opportunity by Lyndon Johnson and the Congressional majorities in the 1960s, and supported by all the most respectable of behavioral scientific theorizing – including by black intellectuals like Frazier – produced a perfect storm.

The Critique

Within a few years, in the mid-1960s, those who hoped that the federal government would get involved in the problems of poverty were encouraged by the creation of programs like *Head Start*, the expansion of older programs like *Aid to Dependent Children*, the funding of such things as *Sesame Street*, etc. But soon, all this slowed down as the mood in Washington changed and the intellectual grounding of these efforts, as well as a reinterpretation of the political motivations that may have made these programs popular, came under withering criticism. In 1967, Lee Rainwater and William Yancey edited a volume summarizing the first wave of reactions to the Moynihan Report. In 1968, Charles Valentine published a critique that remains the best and most systematic presentation of the anthropological response to Lewis.

Lewis' biographer Rigdon (1988: 109–110), in taking a historical look at Lewis' work and the ensuing critiques has summarized the six flaws most often mentioned:

1. Sampling was not from low-income people, but rather from those Lewis believed would exhibit the traits constituting the culture of poverty.
2. Lewis relied on the concept of 'culture trait,' but his departure deviated from common academic usage of the term and he failed to elucidate a definition to illuminate his idiosyncratic use.
3. Lewis put forward no standard to measure the traits typical of the culture of poverty.
4. Lewis assumed that the culture of poverty was a 'way of life' handed down from generation to generation, but conducted no longitudinal studies to demonstrate this point. Instead, he relied upon interviews with consecutive generations of the same family.
5. Lewis' claims about the transmission of the culture of poverty rely upon a causal connection that his data cannot supply.
6. Lewis, much like Mayhew before him, skewed his sample with exceptional cases and eschewed less dramatic cases that might have challenged his assumptions.

Valentine addressed all these matters, and he also emphasized that Lewis' own data, as presented in *La Vida*, for example, did not support his generalizations (1968: 50–66). This interview data actually provides rich portraits of people who are aware of and engaged with concerns and politics beyond their immediate concerns with the problems of family and friends. The empirical Lewis, in contrast to the theoretical Lewis, demonstrates political involvement and activism as well as a cosmopolitanism his theoretical stance denies.

Valentine also criticized Frazier and, by implication, most research in sociology, psychology, linguistics. First, Valentine (1968: 122) argues that Frazier's depictions of the poor are drawn from second-hand case studies and writings made by policemen, social workers, and other observers with their own professional concerns, not from Frazier's first-hand study. Second, Frazier uses census data and other statistical abstracts as evidence of social disorganization, ignoring the effects of the statistical technique in shaping the data.

Alternatives and Follow-Up

Lewis, like his teachers at Columbia University, was concerned with the relationship of individuals to each other and to the institutions they faced. But there were other ways of conceptualizing this relationship that did not veer into studying psychological internalization of 'cultural traits.' The first came directly out of the initial version of the Boasian tradition. The second had its roots in British social anthropology.

Solon Kimball and Alfred Kroeber, at the 1954 Stanford conference on Anthropology and Education, spoke from the Boasian tradition. They called for a powerful turn in the work of the first generation of anthropologists: that any form of human behavior must be seen in its context of use, and approached in a comparative manner.

The second direction was taken by a group of anthropologists working in England. Most notable were Barnes, who studied social like in a Norwegian fishing village (1954), and Bott who wrote about working-class families in London (1958). Both used social network analysis as the means to study the relation of individual to society. Barnes found that individuals were enmeshed in multiple, overlapping networks of social relations stretching into and out of their respective families. The poor in Barnes' study were neither isolated, nor disorganized, nor uninterested in large issues. Similarly, Bott found that the composition of married couples' external social networks in London influenced their roles within the family, and that these networks offered emotional support not offered within the family roles. Hence, Bott found that poor families were not at all isolated. Neither Barnes nor Bott found the lives of the poor or working class to be any less complex or well organized than those of their wealthier contemporaries.

The 1970s and 1980s saw a surge of such studies, mostly by anthropologists, in various settings, through various methodologies, and from the point of view of different theoretical frameworks. Some of the most notable are Carol Stack (1975), Holloman and Lewis (1978), Shimkin et al. (1978) on black families, Ray McDermott's work on the organization of classroom interaction (1977), Paul Willis on working-class youth (1977), Luis Moll on 'funds of knowledge' (1994). Together, they demonstrated more systematically that there are many ways to being poor, that these ways are tied to matters not under the control of the poor, that the poor can strategize in

order to survive, and that they always 'make sense' if one understood the full context of their actions.

A Continuing Debate

It is not the case, however, that all concerned with the poor were convinced by these demonstrations. Glazer's critique of some initial work on blacks in the South by Davis and Havighurst was taken up by sociologists and social pyschologists, who charged anthropologists with romanticization and broad generalization on the basis of very small and nonrandom samples analyzed in unreliable ways that could not be replicated. While many anthropologists criticize the use of statistics, many in the other disciplines criticized their unwillingness to deal with well-established correlations in large data sets. The clarion call may have been sounded by the sociologist William Julius Wilson who, in 1987, affirmed that "liberals will have to propose thoughtful explanations of the rise in inner-city dislocations. Such explanations should emphasize the dynamic interplay between ghetto-specific cultural characteristics and social and economic opportunities" (1987: 18). By casting the debate as one of liberals versus conservatives, Wilson also reaffirmed the moral imperative behind work on the poor that emphasize dislocation.

From a different, though related point of view, the powerful French sociologist Pierre Bourdieu (1977[1972]) wrote many very influential books about what he called the *habitus* that characterize individuals as they are shaped by their conditions ('structured structures') they keep reproducing in themselves and their children ('structuring structures'), as they misunderstand the mechanisms involved in the reproduction of their social positions, particularly those proceeding through schooling and the media. Bourdieu's work has had a major impact on the American social sciences and remains an inescapable reference point when looking at class inequalities and poverty.

In short order, behavioral scientists from a variety of disciplines presented evidence of the dangers a child face when raised in a household led by a single woman with or without step-parents, people like Garfinkel and McLanahan (1986) and Wallerstein and Blakeslee (1989) presented the kind of evidence that led to a reprise of Frazier and Moynihan's take. Linguists presented again the same kind of evidence used in the 1960s to build a case for child deprivation: some children hear more words, in more complex settings, and are thus better prepared for school (Hart and Risley, 2004). This research is once again the foundation of new policies from the 'No Child Left Behind' act to the call for universal preschools, comprehensive education programs, and other broad interventions. Recent research from alternative perspectives points out deficiencies in the use of concepts like 'cultural characteristics,' 'dislocation,' 'deprivation,' by bringing out the evidence that the poor, in the worst of economic circumstances, can still organize themselves to face what is their actual conditions. Evidence has been brought out about the enslaved Africans in the American South who taught themselves how to read (Gundaker, 2007), the Mexican migrant workers who taught themselves English (Kalmar, 2000), fishermen who learn to fish through the experience of catching, or not catching, fish (Pálsson and Helgason, 1998), illiterate parents who teach their children to read (Ranciere, 1991), and the near ubiquitous experience of teaching oneself how to use a computer.

In the long run, it might make the most sense to consider these controversies as a long conversation among mostly well-meaning people seeking to help people in difficulty. The imperative to help will remain, as will the uncertainties of how to do it in such a way that it does not make matters worse. Debates will be continually waged on how to provide the analytic frameworks and empirical studies that might explain the conditions of poverty, and contribute to an assessment of the efficacy of various policies.

Culture Policy Regimes in China

Yue Zhang, University of Illinois at Chicago, Chicago, IL, USA

© 2015 Elsevier Ltd. All rights reserved.

Abstract

Culture policy regimes in China have gone through remarkable changes in the past few decades as a reflection of the political, economic, and social transformation of the country. This article reviews the major changes in China's culture policy regimes and elaborates the underlying driving forces of change. It addresses the issue of intellectual property rights and reveals that the complex administrative apparatus prohibits the enforcement of patent and copyright laws. It discusses the rapid development of cultural industries as a strategy for the government to enhance China's global image and promote economic growth. Despite the trend of privatization and increased autonomy of cultural professionals, this article demonstrates that the Chinese state still maintains effective control of cultural production, and therefore largely constrains creative freedom in the society.

Culture policy regimes in China have gone through remarkable changes in the past few decades. From the 1950s to the 1970s, culture policy was not a separate policy arena in China, but was instead a subordinate of politics and served ideological purposes. With the shift of the government's focus from class struggle and political campaign to economic development, culture policy has gained an independent status. In recent years, culture policy regimes in China have been characterized by privatization, and the development of cultural industry has increasingly become an important policy agenda for both the national and local governments. Despite the trend of privatization and enhanced autonomy enjoyed by cultural professionals, the Chinese state maintains effective control over cultural production; therefore the tension between political control and creative freedom remains a critical issue in China's culture policy arena.

Culture Policy: From the Subordinate of Politics to a Separate Realm

For nearly 30 years after the Chinese Communist Party (CCP) came to power in 1949, there was no independent culture policy in China. Culture policy was not recognized by the government as a separate policy area, but rather as a subordinate of proletarian politics and a tool for reinforcing communist ideology. Meanwhile, the Chinese Communists adopted the Soviet system for the arts after 1949. Such a system constituted a complete mobilization and total control of the arts allowing no room for private or unofficial art (Croizier, 1999). In the frantic years of the Cultural Revolution (1969–79), culture was used to assist political campaign, and culture policy became extremely ideological. A large number of cultural and art professionals were persecuted because their works were condemned by the authorities as inconsistent with the reigning political ideology (Mao, 2008).

The situation began to change with the end of the Cultural Revolution. From the late 1970s, the government changed its focus from class struggle to economic development. With the launch of economic reform and opening up in 1979, the government began to adopt a more open attitude toward arts and culture. In October 1979, the Fourth Representative Meeting of Cultural and Art Professionals (中国文化艺术工作者第四次代表大会) was held in Beijing. At the meeting, Deng Xiaoping, the leading architect of China's economic reform, gave a speech on behalf of the CCP. In the speech, Deng claims that slogans such as 'culture and art are subordinate to politics' should be abandoned. He emphasizes that CCP's leadership role in cultural affairs should concentrate on providing favorable conditions to cultural and art professionals and thus nurturing the development of culture (Mao, 2008). This meeting is considered the turning point in the development of China's culture policy regime, as it symbolizes the separation of culture from politics and demonstrates the party's recognition of culture policy as an independent realm.

Despite the more open attitude toward art and culture, the Chinese government did not give up its control over the cultural realm. In 1981, the CCP Central Committee announced the 'Decisions on News Media', which emphasizes the CCP's desire to eliminate cultural products that spread 'incorrect thoughts' in society. In the same year, the Department of Propaganda of the CCP Central Committee held a nationwide meeting to criticize the cultural products that were inconsistent with socialist ideology and challenge the leadership of the Party. In 1983, Deng gave a speech titled 'The Urgent Tasks of the Party on the Ideological Front', in which he stresses the importance of reinforcing the leadership of the Party in culture and arts with a particular focus on areas like education, news media, publication, broadcasting, and television. In 1986, he published another speech titled 'Firmly Fighting against Bourgeois Liberalization'. This speech stresses the importance of fighting against bourgeois liberalization and spiritual pollution, warns against the danger of copying Western democracy, and emphasizes the necessity of the CCP's leadership and socialist ideology.

While the Chinese state is wary of Western influence and keeps a close eye on the development of culture and arts, it has separated culture from politics. In connection with the depoliticization of the role of culture, the power over culture policy shifted from the central government to the local government.

 http://dx.doi.org/10.1016/B978-0-08-097086-8.10438-6

The first nationwide cultural development plan was proposed in the Eleventh National Five-Year Plan (2006–10). However, this plan does not offer specific solutions to the regional differentiation in China regarding cultural planning. Nor does it provide national level strategies for cultural development. China's culture policy regimes remain largely decentralized and localized. In particular, municipalities have increasingly become the main actor in the making and implementation of culture policy.

Among the various issue areas that the Chinese government is working on, the question of intellectual property rights is one of the most crucial and controversial issues being addressed. China is by far the world's leading producer of pirated goods, including cultural products such as films and books. In recent years, as China becomes a full participant in the international economy, there is increased external pressure on China's enforcement of intellectual property. However, as Mertha (2007) insightfully points out, greater pressure does not lead to better domestic compliance with international norms. Although external pressures may lead to formal agreements in Beijing, resulting in new laws and official regulations, it is China's complex network of bureaucracies that decides actual policy and enforcement. Specifically, the structure of the administrative apparatus that is supposed to protect intellectual property rights makes it possible to track variation in the effects of external pressure for different kinds of intellectual property. As a result, whereas the sustained pressure of state-to-state negotiations has shaped China's patent and copyright laws, it has had little direct impact on the enforcement of those laws. China still has a long way to go in order to better protect intellectual property rights.

Cultural Industry: Between State Monopoly and Privatization

With the depoliticization of culture policy, China launches cultural industries that bring the culture policy regime into a new era of commercialization and privatization. The idea of cultural industries was introduced to China via the epistemic community of international scholars and consultants in the late 1990s, and it has since generated much interest on the domestic policy circuit. In 1998, the Ministry of Culture established the Division of Cultural Industry as the central political agency in charge of cultural industries. In October 2000, the Fifth Plenary Session of the Fifteenth Central Committee of the CCP (zhongguo gongchandang shiwujie wuzhong quanhui 中国共产党十五届五中全会) first mentioned cultural industries in the 'Suggestions for the Tenth National Five-Year Plan'. The document establishes many goals: improving the policies of cultural industries, building the market of cultural products, improving their management, facilitating the development of cultural industries, and promoting the integration between cultural industries and information technology industries. In March 2001, the suggestions were approved by the Fourth Session of the Ninth National People's Congress (quanguo renda jiujie sici huiyi 全国人大九届四次会议) and were included in the Tenth National Five-Year Plan (2001–05). In the same year, the Chinese government published the Blue Book of China's Cultural Industries. It discusses in detail the development of different types of cultural industries, including news media, publishing, movies, and design.

The development of cultural industries is largely driven by two factors. The first is the political consideration associated with the symbolic value of culture, i.e., the desire of the national government to enhance the global image of China and build 'soft power'. The second is the economic concern, i.e., the attempt of both the national and local governments to upgrade labor-intensive manufacturing to knowledge-based industries.

The competition between major world powers is no longer limited to the military or economic realm. In his article entitled *The Rise of China's Soft Power*, Joseph Nye (2005) argues that, in addition to hard power such as military and economic strength, China is also competing with the United States by building its soft sources of power such as culture, political values, and diplomacy. This is demonstrated in the recent government sponsorship of initiatives to teach Chinese language and culture overseas, such as the Confucius Institutes (Ren and Sun, 2012). Nye also points out that China's soft power still has a long way to go in order to match that of the US. For example, China does not have cultural industries like Hollywood that have pervasive global impact. Policymakers in China are fully aware of the imbalance in cultural trade, and they view the development of cultural industries as the right tool to build China's soft power and enhance its global competitiveness.

There is also economic rationale behind the development of cultural industries in China. The widespread support for cultural industries reflects the need for economic upgrading felt by the national and local governments. The Tenth National Five-Year Plan (2001–05) stated that the rationale for promoting 'cultural industries with Chinese characteristics' is to stimulate domestic consumption demand, increase employment opportunities, and restructure the national economy (State Council, 2001). According to Keane (2006, 2007), cultural industries have become a 'supersign' in China, invested with supernatural powers to transform and revitalize the urban economy. Ren and Sun (2012) also point out that many Chinese cities trying to move up the value chain of global production view the development of cultural industries as key to making the leap from 'Made in China' to 'Created in China'. The development of cultural industries would also aid China in the achievement of many other goals such as wealth creation, the reuse of traditional resources, green production, talent renewal, and industrial upgrading.

However, the development of cultural industries poses a problem for the Chinese government. How will the government maintain its control over cultural production while capitalizing on a more market-based cultural economy (Hui, 2006; O'Connor and Xin, 2006)? As Wang (2004) insightfully points out, cultural industries in China comprise at least three subcontexts: the partial privatization of the formerly state-owned cultural sector, the persistence of state monopoly even when it pushes an agenda of commodifying public cultural goods, and the issue of mixed ownership of firms in the cultural sectors. The conflicted role of the state is reflected in the uneasy adoption of the terms 'cultural industries' (wenhua chanye 文化产业) and 'creative industries' (chuangyi chanye

创意产业) in official documents. Shanghai is the only Chinese city that has officially adopted 'creative industries' (Chen and Zhu, 2009), whereas Beijing has clearly rejected 'creative industries', preferring 'cultural industries' (Hui, 2006). O'Connor and Xin (2006) argue that the tensions arising from these terminologies have allowed a renegotiation of the divisions of responsibility from public sector dominated, ideologically charged 'culture' to private sector–oriented 'creativity'. The ambiguous stance of the state can also be glimpsed in key government policies, which invariably push for further privatization of the cultural sector while maintaining the monopoly of state-owned firms (Ren and Sun, 2012).

The tension between state monopoly and privatization of the cultural sector is just one defining feature of the development of cultural industries in China. Other critical issues associated with the development of cultural industries are land acquisition and real estate speculation. Ren and Sun (2012) maintain that the promotion of cultural industries has led to a frantic period of land seizures, which is reminiscent of the development zone fever of the 1990s. Large tracts of land are acquired by local states to develop creative industry parks and clusters. Many such schemes have led to widespread land speculation and involve little in the way of cultural industry development.

A phenomenal example of the development of cultural industry is Songzhuang Town, an eastern suburban district of Metropolitan Beijing (Zhang, 2014). In 2004, the town government proposed a strategy of 'Developing the Town with Culture', and it designated an area of 14.6 km^2 south of the town to be developed into the largest cultural industry district in China. While this plan is helping the local government to increase revenue, it is also bringing about rapid urbanization and drastically changing the spatial and social dimensions of the area. To implement the plan of developing cultural industries, villagers' land is taken over by the town government. The landownership is changed from collective to public and thus becomes eligible for redevelopment. There are two types of landownership in China after 1949, public landownership in urban areas and collective landownership in rural areas. The town government only controls the urban land due to the public landownership. The villagers collectively own the rural land and they often defer to the village committee when making critical decisions about the land. Therefore, in order to make villagers' land eligible for redevelopment, the first step for the town government is to obtain the landownership, i.e., changing it from collective landownership to public landownership. With the change of the landownership from collective to public, the land status is consequently transformed from rural to urban. For more discussion on this topic, see Ho (2000, 2008). Most of the old houses are demolished and villagers are relocated to high-rise apartment buildings elsewhere in the town. A total of 12 villages, 17 995 villagers are affected by the development plan. After the clearance of the site, various types of creative industries and facilities are constructed, including art studios and galleries, animation industry, and movie production. What is happening in Songzhuang raises many concerns regarding the long-term, sustainable development of the area and the well-being of the displaced peasants.

Art Districts: The Control of Art Community and the Creation of New Cultural Space

An important aspect of the culture policy regime is how the government controls the art community and creates cultural space. Artists have long been marginalized in China since their ideas often conflict with the mainstream political ideology. In major Chinese cities, artists often live on the fringe of society in 'artist villages', where they almost always face the threat of being displaced due to political decisions or urban renewal. Yuanmingyuan Artist Village, the first underground artist village in China, was located at the western suburb of Beijing adjacent to major universities. Emerging in the late 1980s, the artist village was dismantled by police in 1995 in the name of improving public safety. In recent years, however, the Chinese government adopted a different policy toward the art community. Instead of demolishing the underground artist villages, the government designated them as art districts. The change is largely driven by the attempt of the government to enhance its image globally and to promote the development of cultural industry. This section explains the formation of the most phenomenal art district in China, Factory 798. While Factory 798 is unique due to its prominent national and global status, the development trajectory of the area is typical among many art districts in China.

Factory 798 is the largest segment of 718 Joint Factory, also known as North China Wireless Joint Equipment Factory, located in Chaoyang District in the northeast of Beijing. This huge, secretive factory complex was built under Chairman Mao in the 1950s in order to produce advanced technology for the Chinese military. The factory complex was designed by Eastern German architects in the Bauhaus style, and the construction was supported by Chinese and Soviet funds (Huang, 2008). As the biggest production site of electronic components in Asia, the factory was considered in the early years of the People's Republic as a showcase of China's achievement in industrialization and modernization as well as a symbol of international socialist cooperation.

Factory 798 began to decline in the 1980s with China's economic reform and the deindustrialization of Beijing. The economic reform was launched in the late 1970s and one of the key agendas was to promote the development of the private sector and reduce the share of state-owned enterprises (SOEs) in the Chinese economy. Deindustrialization took place in Beijing in the 1990s and precipitated the closure of many factories in the city. In 2000, Factory 798 was downgraded from a state-level SOE to a municipal-level SOE, named Beijing Seven Stars Group, specialized in high-tech electronics industry (Huang, 2008). By 2001, Seven Stars had closed several factories and laid off around 15 000 of its 20 000 workers (Currier, 2008). In order to provide pensions to the workers, it began to lease the empty factory space for an additional revenue.

Some independent artists moved into the idle workshops of Factory 798 after the Yuanmingyuan Artist Village was dismissed by the government. They were attracted to the place by the huge space and the low rent. The Bauhaus-styled workshops have enormous, cathedral-like spaces with swooping arched ceilings. The spacious interior, the natural light streams, and the succinctness of this 'form follows

function' design make the workshops a perfect place for art studios and exhibition halls. The legacies from the socialist era remain in the workshops: rusted machines are standing in the corners; gigantic slogans such as 'Long Live Chairman Mao' printed in red are still on the wall. The visual effect is stunning when avant-garde artworks are exhibited in the obsolete Maoist factory setting.

The number of art galleries and studios rapidly increased in Factory 798. A coincidental factor that contributes to the growth of the art community at Factory 798 is the relocation of the Central Academy of Fine Arts (CAFA). To expand its campus, the CAFA moved out of the city center in 1995 and relocated to Wangjing 望京, an area next to the East Fourth Ring Road just west of Factory 798. The proximity of CAFA brings many art professors and students to this area. See Sun (2010). The area began to draw lots of attention from the media and international society. It has become not only an icon of contemporary Chinese arts, but also a symbol of Beijing as a global city. In 2003, *Newsweek* ranked Beijing as the 12th World City, with the existence of the art community at Factory 798 being considered a significant contributor to Beijing's global status. In the same year, *Time Magazine* selected Factory 798 as one of the Top 22 Most Vibrant Art Districts in the world. Many foreign officials have visited Factory 798 over the years. Viviane Reding, the European Union's Minister of Culture, cited the area as evidence that China was opening up, much to the delight of Chinese politicians (Currier, 2008).

Despite the vigorous growth of the art community, Seven Stars planned to raze the area and build a high-tech park in order to make more profit. The leases with most artists lasted for only 3–5 years and they were supposed to be ended in 2005. In 2003, Seven Stars stopped leasing new space to artists and began to prepare for the demolition. To prevent the area from being demolished, the artists launched a campaign, and their activities were widely covered by the media. In 2004, Factory 798-based artist Li Xiangqun, also a professor at the Central Academy of Fine Arts and a representative in the People's Congress of Beijing, raised a motion to the municipal government to preserve the factory as an art district (Sun, 2010). After a lengthy debate and long wait, the motion was eventually supported by the municipal government.

As Zhang (2014) points out, the national government played a pivotal role in preserving the factory from demolition. Li Changchun, one of the nine members of the Politburo Standing Committee, had a direct impact on the decision. As China's 'propaganda chief', Li is in charge of issues related to publicity, including arts, media, and publishing. When asked to offer an opinion on the case of Factory 798, Li said only nine characters – '看一看，论一论，管一管' (kan yi kan, lun yi lun, guan yi guan) – which means in English have a look, have a discussion, and have a regulation. The concise yet vague statement shows that while the government is inclined to protect the art district from demolition, it does not have a clear plan on how to deal with the area. The national government's support for the preservation of the art district is largely due to the Olympics. After the successful Olympic bid, the government felt the urgency of presenting a more open image worldwide, and the art district provided a stage for the fulfillment of this goal.

In 2006, Factory 798 was officially designated by Beijing Municipality as a Cultural Creative Industry Cluster (wenhua chuangyi chanye jijuqu 文化创意产业积聚区). To supervise the activities in the art district, a management office was created in 2006 under the direction of the Beijing Municipal Department of Propaganda. The office monitors and censors art exhibitions and activities taking place in the art district to ensure they are in accordance with the mainstream political ideology. One major action taken by the office was the decision to ban the Dashanzi International Art Festival (Dashanzi guoji yishujie 大山子国际艺术节), the first and only independent art festival in Beijing run by artists in Factory 798 for 3 years. The office launched the 798 Art Festival and claimed it was the only legal art festival in the art district. By depriving the right of the artists to organize their own art festival, the office reduced the chances for the artists to mobilize resources and social forces, thus limiting their potential challenge to the political regime.

The power of land leasing is in the hands of Seven Stars. Through a land leasing office, the SOE exercises its complete discretion on issues like whom to admit as tenants and at what price. Given the fact that Seven Stars gave up the more profitable high-tech park plan to accommodate the city's demand to build the art district, this arrangement is a way for the city to financially compensate the SOE. Without any governmental regulation, land leasing in the art district becomes a means for the SOE to gain profit, so the leasing price rocketed. Accelerated by the unregulated subcontracting, the leasing price at Factory 798 increased sevenfold within 5 years, from 0.65 to 5 yuan m^2 per day in 2001 and 2006, respectively. Many artists, including some of the early settlers, cannot afford the rent anymore and moved out of the district.

Over the years, Factory 798 has rapidly developed into a popular site for art and entertainment. The number of art galleries and studios increased from 22 to 398 in 2003 and 2008, respectively, exceeding many art districts in the world. Taking the art districts in New York City as an example, both SoHo and Chelsea are well-established art districts with much longer history than Factory 798, but the number of art galleries and cultural institutions in those two areas does not exceed that of Factory 798. There are about 300 art institutions in SoHo and 200 in Chelsea. See Molotch and Treskon (2009). Some internationally renowned art institutions, such as the Guy & Myriam Ullens Foundation and Pace Gallery, opened their branches in Factory 798, thus enhancing the global status of the district. Besides art exhibition, a variety of commercial activities take place in the art district, including company opening ceremonies, product advertising and marketing events, fashion shows, and movie premieres. Hosting these activities increases the income for the land leasing office and individual gallery owners, but it causes a decrease in the space available for art exhibitions. Meanwhile, Factory 798 has become a hot tourist spot in Beijing. The number of visitors to Factory 798 has tripled in 3 years, from 450 000 to 1 500 000 in 2005 and 2007, respectively. During the 2008 Olympics, the area drew 10 000 visitors per day. See Sun (2010). Some tourist guide books list it as one of the 'Three Must Sees' in Beijing, along with the Forbidden City and the Great Walls. All sorts of amenities, including restaurants, cafes, bars, and boutique

shops, are booming in the area, transforming Factory 798 into a tourist bubble.

Chinese artists' associational life is a tricky issue. According to the Chinese Constitution, social members are entitled to organize in associations; however, the key personnel in charge of civic organizations are usually governmental officials, either officials who are still in office or those who recently retired. Therefore, instead of promoting civic liberty, the organizations help the government implement its control over civil society. For example, a nongovernmental organization, Songzhuang Association for the Promotion of Arts (Songzhuang yishu cujinhui 宋庄艺术促进会), was created in Songzhuang Cultural Industry District in 2005. The organization is registered as a civic organization whose major mission is to provide social services to artists. However, the key personnel of the association are local governmental officials, and the real function of the association is to monitor the activities of artists. It is under such mechanism that the associational life of Chinese artists does not counterbalance the dominance of the state, but rather reinforces political control.

An Unsolvable Conflict: Political Control vs Creative Freedom

A critical issue facing the cultural realm in China is the tension between political control and creative freedom. As in many authoritarian regimes, political censorship is pervasive in China. Creative imagination and content are subjugated to active state surveillance. According to Wang's report of the censors' latest activities (2004), distributors of 'cultural products' via the Internet have required state licences since 1 July 2003; content censorship of imported video games is to be strengthened; and, finally, only 10 firms approved by the state can now run National Internet Cafe Chains. These state-sanctioned chains will soon push independent operators out of the market. The setback to the Internet in recent years – the medium theoretically most immune to boundary policing and centralized monitoring devices – is highly symptomatic of China's ongoing problems with censorship and creativity.

In 2005, the National People's Congress coined the slogan of 'Building a Harmonious Society' (jianshe hexie shehui 建设和谐社会). As a reflection of New Confucianism, the slogan emphasizes the importance of maintaining balance and harmony at the societal level. However, this slogan is criticized by independent intellectuals and social activists as empty rhetoric that the Chinese government utilizes to justify its suppression of discourse differing from its own and to silence the voices of Chinese society's discontents. See http://www.newcenturynews.com/Article/gd/201107/20110714135748.html. Widely applied to almost every aspect of social life, the slogan is used by the leaders as a principle to evaluate art and cultural production. They contend that art production should reflect the 'bright side of life' and contribute to the construction of a 'Harmonious Society'. By incorporating cultural production into the scheme of 'Building a Harmonious Society', the government not only exercises control over creative freedom, but also employs creative freedom as a device to maintain social and political stability.

Under the scheme of 'Building a Harmonious Society', the government strictly controls the channels of art publication, exhibition, and circulation. In her study of contemporary Chinese arts, Zhang (2014) discovers that Chinese artists seem to enjoy more autonomy in art production than their Eastern European counterparts in the communist era. Chinese artists can address political issues in their works as long as they do not go beyond the 'redline', i.e., not to directly condemn the CCP or its major leaders such as Chairman Mao and President Hu. The secret to the artists' autonomy, Zhang (2014) argues, lies in the fact that the government effectively controls the channels of art publication, exhibition, and circulation. In other words, although artists can produce politically controversial artworks, there are very few chances for them to circulate the works domestically so that they have little impact on Chinese society. Given that the channels of art publication, exhibition, and circulation are under strict state control, many artists have to send their work overseas in order to reach a broader audience (Li and White, 2003; Barmé, 2000). As a result, most politically charged works become 'quarantined domestically' and are intended 'for export only'.

Besides censorship, another approach for the Chinese government to control creative freedom is cooptation. The most important institution to employ cooptation is the China Artists Association (Zhongguo meishujia xiehui 中国美术家协会). Created in 1949, this is a single state-controlled artists' association to which all official artists belonged. This is one of the key features of the Stalinist system for the arts, which the CCP adopted from the beginning of its reign. This association has played a crucial role in organizing and controlling Chinese artists.

A more recent example of how the state uses the strategy of cooptation to influence the cultural professionals is the creation of the Chinese Academy of Contemporary Arts (Zhongguo dangdai yishu yuan 中国当代艺术院). Contemporary Chinese arts burgeoned in the 1980s with China's economic reform and opening up. Given the politically sensitive aspect of much contemporary artwork, contemporary Chinese arts have not been formally recognized by the Chinese government for a long time, and the artists are generally viewed by the political authority as troublesome. In 2009, the Chinese Academy of Contemporary Arts was founded by the government as the first national institute of contemporary arts. It is a branch under the Chinese National Academy of Arts (Zhongguo yishu yanjiu yuan 中国艺术研究院), the only national research institute of art. Supervised by the Publicity Department of the CPC Central Committee and the Ministry of Culture, the Academy of Contemporary Arts functions like a semigovernmental agency. According to the official Web site of the Academy, the mission of the institution is to promote research, education, and production in the field of contemporary Chinese arts. See http://www.zgysyjy.org.cn/newart/lanmuye.jsp?class_id=13_03_08. With the creation of the Academy, 20 leading contemporary Chinese artists (for a list of the names of the artists, see http://www.zgysyjy.org.cn/newart/yishuchuangzuo9.jsp) were appointed as academicians, some of whom are well known for their politically critical works. The creation of the Academy of Contemporary Arts and the entitlement of the artists seem to be a major step taken by the Chinese government to enhance the political and social status of the art community. However,

many artists view the initiatives as a state strategy to co-opt the leading artists and to control the entire art community through them (Zhang, 2014).

Major Characteristics of China's Culture Policy Regimes

Culture policy regimes in China have changed drastically over the past decades as a reflection of the political, economic, and social transformation of the country. The current culture policy regimes in China have three major characteristics. First of all, culture policy is separated from politics as an independent policy arena, but cultural production and creative freedom are not free from politics. They are still subjugated to active state surveillance. Second, the development of a cultural industry and a market-based cultural economy are important goals that China is pursuing at both the national and the local level. However, these efforts are frustrated by the tensions that naturally emerge between the state monopoly and the privatization of the cultural sector. Third, globalization plays a significant role in shaping China's culture policy regimes. Global events, such as the Olympic Games, provide incentives for the Chinese state to adopt a more supportive and open attitude toward the cultural sector in order to enhance its global image. While China has become the most prominent rising power in the world, it still has a long way to go in order to build a vital culture policy regime that truly supports the development of its arts and culture.

Abstract

The production perspective focuses on the ways that symbolic elements of culture are shaped by the systems within which they are created, distributed, evaluated, taught, and preserved. The substantive topics have most often been systems in which art works, musical styles, literature, scientific research reports, religious celebrations, legal judgments, media programing, and news reports are made. In addition, the perspective has been applied to situations where the manipulation of symbols is a by-product rather than the goal of collective activity. The perspective is grounded in the constructivist view of culture bounded by the institutionalized systems of production. A widely applicable hypothesis is that the greater the competition between culture producers, the greater will be the diversity of what is produced. Key topics include the differences between 'high' and 'low' forms, cultural mobility between these, the changing criteria of prestige, the autoproduction of culture, cultural entrepreneurship, the fabrication of authenticity, and the shaping of collective memory.

The production of culture perspective focuses on the ways in which the content of symbolic elements of culture are significantly shaped by the systems within which they are created, distributed, evaluated, taught, and preserved. Practitioners of this perspective are most likely to focus on the fabrication of expressive-symbol elements of culture such as art works, scientific research reports, religious celebrations, legal judgments, television programing, and newsmaking which, in turn, embody, modify, and give concrete expression to the 'norm,' 'value,' and 'belief' elements of culture. The perspective has also been successfully applied to a range of quite different situations where the manipulation of symbols is a by-product rather than the goal of the collective activity (Crane, 1992; Peterson, 1994).

Two early studies show the promise of what later came to be called the production perspective. First, in their study of the emergence of impressionist art in nineteenth-century France, Harrison and Cynthia White (1965) found inadequate the then prevalent theories that said changes in art are associated with revolutionary changes in society or with the emergence of persons of genius. Instead they found that the older Royal academic art production system survived the economic turmoil and ideological changes of the French Revolution but collapsed a generation later, because of the emerging art market created by Parisian art dealers and critics who fostered unconventional artists such as the Impressionists.

Second, noting the set of nineteenth-century American novels that traced the battles of lone individuals against nature, novels ranging from the frontiersman stories of James Fenimore Cooper to Herman Melville's saga of the titanic struggle of a man against a white whale, Moby Dick. Literary critics and Americanists had long asserted that these works evidenced America's distinctive culture of individualism and entrepreneurship. They contrasted such works with the novel of manners produced by English authors, which were held to represent English culture. In her careful analysis, Griswold (1981) put this facile generalization in doubt. She found that the English novels of manners sold better in the United States, as well as in England, than the man-against-nature novels. Significantly before 1909, American publishers preferred works by English authors because they could be sold in the US without paying author's copyright fees, while American authors had to be compensated. To sell their work, American authors turned to several specialty topics, including the man-against-nature theme. With the changed copyright law of 1909, American and English authors were put on the same footing, and a rapidly increasing number of American authors successfully published 'English' style novels of manners. This fact that was once read as evidence of 'the closing of the frontier,' Griswold sees as an important result of changes in copyright law and its ramifying influences on the literary production process.

Research in the production perspective draws freely on theories, methods, and concepts developed in other branches of sociology. It is, however, distinctive in focusing on the consequences of social activities for culture. Thus, for example, the 'newsmaking' studies of the 1970s exemplify the production perspective because their authors were not satisfied to simply deconstruct the content of news or to trace the organizational and occupational dynamics of news organizations. In addition, they highlight the consequences of these for the formation and transformation of 'news' (cf Molotch and Lester, 1974; Tuchman, 1978; Gans, 1979).

Establishing the Production Perspective

The production perspective emerged in the 1970s largely in response to the failure of the earlier dominant idea that culture and social structure mirror each other. This 'mirror' or 'reflection' view had been developed by anthropologists who studied small preliterate groups, where it seemed credible that a self-consistent set of social institutions would be reflected in a cognate coherent set of cultural symbols. The idea that there is a symbiotic relationship between a singular functioning social system and its coherent overarching culture was freely embraced by most theorists of contemporary society as well, including in the 1950s and 1960s most Marxists and functionalists such as Talcott Parsons. The former asserted that

 http://dx.doi.org/10.1016/B978-0-08-097086-8.10456-8

those who controlled the means of producing wealth could shape culture to fit their own class interests. The latter believed that a set of monolithic abstract values were more long lasting and determined the shape of social structure.

The reflection view proved to be of limited use, however, in understanding the relationship between social structure and culture in industrial societies and was also being widely questioned by anthropologists studying preliterate societies. Breaking with the older mirror view, the production perspective – like most of the other contemporary perspectives in cultural sociology – views both culture and social structure as an emergent patchwork and the relationship between them as problematic (Peterson, 1979).

Publication in 1976 and 1978 of anthologies entitled *The Production of Culture*, edited by Peterson and Coser, respectively, signaled the emergence of the production perspective as a coherent and self-conscious approach in culture studies, claiming to be applicable across a wide range of specific fields and genres. Many of the early researchers in the perspective had been trained in the sociology of organizations, industry, and occupations and brought their skills in the analysis of material production to the fields of symbol production. Others came to the perspective with a love of or commitment to a particular form of cultural expression such as opera, rock, dance, television, or literature. A number of developments since the 1970s show the progressive establishment in sociology of the production of culture perspective. Two textbooks and an anthology have appeared with the title *The Production of Culture* (Crane, 1992; Ryan and Wentworth, 1998; Gay, 1997), and the perspective receives full chapters in recent texts in the sociology of art (Zolberg, 1990) and in the sociology of culture (Hall and Neitz, 1993).

From the outset, the perspective promised not only a way to better understand the shape and form of any particular cultural expression but also to facilitate three kinds of comparisons as follows: (1) comparisons across broad cultural production realms including art, popular culture, religion, science and law; (2) comparisons across the division between 'elite' and 'common' that tends to emerge in each realm; and (3) comparisons across societal, institutional, or organizational, and microlevels of analysis (Peterson, 1976). Progress toward achieving these goals has been uneven (Ryan and Wentworth, 1998).

We will review progress and problems in working toward these three goals and point to several emerging lines of inquiry that link the production perspective to other approaches in cultural studies, citing studies that exemplify the perspective, even when the authors have not formulated their work in production terms. We begin by showing the utility of the perspective by reviewing a few specific lines of research. This article will also briefly note, as appropriate, cognate work in other realms.

The Production System in the Cultural Diamond

Griswold (1994) has argued that to be complete, the study of any cultural phenomenon, be they books, paintings, legal systems, religious precepts, or news stories, must take into account four classes of phenomena. In addition to a close analysis of the cultural works themselves, they also focus on the situation in which people create works, the nature of the audience, and the relevant aspects of the society at large. She sees these as four points on a diamond with society at the top, the cultural work at the bottom, the creators on the left point, and the audience on the right. With this model in mind, the production system can be seen as a square overlaying the diamond, the square being large enough so that its corners intersect each of the sides of the diamond. This addition makes clear that elements of the production system intervene between each of the four facets of the diamond, so that the influence of each on the others is mediated by the production system.

To illustrate the workings of the production system in shaping culture, Peterson's (1990) analysis of why rock music became the dominant form of popular music will be used. In the early 1950s, the music industry was blind to the large and growing unsatiated demand for greater variety in music and was deaf to the efforts of musicians who might have satisfied that demand. The music industry was financially as well as aesthetically committed to the big band-crooner style of popular music of the time, and, because of its oligopolistic control of the production, distribution, and marketing of new music, was able to thwart the marketing of alternative styles. Yet in the mid-1950s, the power of the music industry oligarchy was broken and the rock of Chuck Berry, Elvis Presley, Bill Haley, and Little Richard became the defining force of music in the United States and much of the world. In the middle of the quiescent Eisenhower years, no major political or economic upheaval could account for such change.

Six production factors working together are identified as making possible the rapid cultural change. These include law and regulation, technology, industrial structure, organizational structure, occupational careers, and the consumer market. In brief, with the transfer of network radio programing to the emerging new medium, television, radio turned to playing records as the cheapest effective form of programing. The granting of many new radio station licenses, the arrival of cheap transistor radios, and the development of the top 40 radio-as-jukebox format meant that the listening audience was exposed to a much larger number and far wider range of music. Using the new durable 45 rpm records, and taking advantage of the developing network of independent record distributors, numerous independent record companies experimented with a wide range of new sounds in an effort to tap the unsatiated market demand. In a matter of 24 months between late 1954 and early 1957, rock was forged in this caldron of entrepreneurial creativity (Peterson, 1990; Ennis, 1992). In the decades since, the large media conglomerates have gradually reconstituted their oligopolistic control of the industry, and the market has been divided into an ever larger number of increasingly homogeneous market segments (Lopes, 1992; Negus, 1999).

Using the same six variables employed in the analysis of the emergence of rock music, the production perspective can bring some order to a welter of different trends taking place in commercial music at the turn of the millennium. On the one hand, a few artists are accounting for an ever larger proportion of diminishing aggregate record sales, and at the same time there is an explosion in the number and diversity of artists who are making and independently distributing CD recordings.

To increase their popularity with the masses of sometime music buyers, megastars such as Michael Jackson, Garth Brooks, Celine Dion, the Spice Girls, and Shania Twain make their work ever more safe and predictable. This aesthetic shift is encouraged by the marketing needs of their record companies who are aggregating into ever larger multinational media conglomerates, dependent for promotion on radio stations whose ownership is rapidly consolidating as well. These large firms can work efficiently only if they sell millions of units of a few recordings. The majors have been able to control the market by effectively controlling the channels of marketing and distribution.

The hegemony of this star-marketing system is being challenged by a new system of promotion and distribution that is coming into being. Since the late 1980s, the technology has been available to make possible the digital recording of music and, therefore, the storage, reproduction, and transmission of sound without any decay in quality. Given the increasing power of Internet technology, its maintenance as a free highway of information, and the availability of inexpensive software, making it easy for any musician to create a 'home page' and transmit sound. In this emerging field, independent music producers can make, market, and distribute their work independent of the major media conglomerates.

If this system develops successfully, it can increase the power of artists, reduce the power and profitability of the large firms, foster an explosion in the number of artists and firms able to reach wide audiences, and significantly increase the levels of experimentation in popular music, creating new markets for an explosion in the range of music regularly on offer. It is as likely that, through the elaboration of copyright and censorship law, together with control of the patents for the technology necessary for the new system, the major firms will keep control of developments in popular music.

The Promise of Comparative Analysis

One of the features of the production perspective is that it facilitates comparative analysis of three sorts: comparisons across symbol-producing realms, comparisons between elite and popular forms within each realm, and comparisons across societal, institutional, and microlevels of analysis. To date, most studies in the production perspective have focused on particular fields, and progress toward fulfilling the promised benefits of comparison has been uneven, as we will show.

Comparisons across Symbol-Producing Realms

Mid-twentieth century functionalists argued that cross-realm comparisons are fruitless because each has its own unique core value. Essentially Parsons (1961) argued that science deals in experimentally established fact, law deals in reason, art deals in aesthetics, and religion concerns faith in the supernatural. The nominalist stance of the production perspective, however, problematizes these differences, making the assertion of uniqueness a residual to be asserted when no similarities can be established.

The expectation that the same range of processes are present in all realms of culture production, be they religion, art, science, law, etc., does not mean that new discoveries in physics are produced in the same way as is new religious doctrine. Rather it means that the differences can be explained, in large part, by the conditions of production in each of the realms (Crane, 1976). For example, knowledge in physics today is largely controlled by a single subsidized and self-perpetuating worldwide 'priesthood' that works to allocate resources and rewards in ways that perpetuate its views; at the same time, religious doctrine varies greatly from country to country, and, particularly in the United States, a wide range of religious specialists mu compete with each other in an open market for the lay consumer's attention and for resources, loyalties, and rewards.

These differences, however, are not inherent in the nature of the subject matter of these two realms, as can be seen by reference to earlier times when the production systems of science and religion were very nearly reversed. In the eighteenth century, English scientists supported themselves and their work by periodic shows of spectacular findings that induced laymen to give them further support, and in the seventeenth century, religious scholars worked with the support and protection of an Established Church orthodoxy and defied it only in mortal peril of their lives. Likewise, eighteenth-century French painters worked with the protection of an all-powerful academy, while today they work in conditions of near perfect competition. In each of these instances, the movement from one sort of production system toward the other has had profound consequences for every aspect of the art world, including even what is considered to be art (White and White, 1965; Becker, 1982).

As recent research on the roles of women in each of the symbol-producing realms has shown, much less dramatic changes in the nature of the production process may have major consequences for a particular class of producers. Systematic comparison across realms will highlight the structural and symbolic underpinnings of such institutional discrimination.

Distinctions between High and Low

An invidious distinction between artefacts, practices, and practitioners considered reverentially and those who are considered to be profane is found in each of the culture-producing realms, and this fact furnishes a great opportunity for comparisons both within and across production realms. To date, however, the distinction has done more to inhibit such comparisons because the truth value vested in high (art, science, religion, law) symbols and the honor status accorded to those in the fields where they are produced is often seen to render these fields incomparable with each other and also with the low counterparts in their own realms (Gans, 1974).

Working from the nominalist stance of the production perspective, one can cut through these problems by asserting that any of the invidious high–low distinctions are not inherent in the cultural objects, but rather they involve a social, or better, a cultural construction of reality. At issue are the questions: who gets to make the designations, on what basis are they made, and within what range are they accepted. There are a number of excellent case studies touching on these issues, but there has been very little thinking about the conditions supporting one system of evaluation or another across all the realms of cultural production. The most systematic efforts in

this direction can be found in the works of Pierre Bourdieu and his colleagues. In the paragraphs that follow, two issues are considered: the mobility between high–low categories, and the differentiation and dedifferentiation of high and low.

Cultural Mobility

In the arts, particular works and artists, and even entire genres, experience aesthetic mobility over time (Becker, 1982). DeVeaux (1997) details the sociopolitical and music industry conditions that caused the aesthetic mobility of jazz from folk to popular to fine art music. In the religious realm in the United States, there has historically been a cycle in which the established church organization becomes increasingly rigid and out of touch with people's felt needs, and a number of reformist charismatic groups form to serve the demand. As the established churches loose power, the surviving reform groups become ever more established and churchlike.

Changing Criteria of Prestige

The distinction between popular culture and high art that was such a fixture of American society by the middle of the twentieth century (Gans, 1974) only began to be clearly articulated in the later decades of the nineteenth century. The differentiation of high–low was driven by the class interests of rising status groups, and the criteria for claiming prestige has changed in recent decades (Crane, 1992). There is evidence that the highbrow exclusiveness that was at the core of cultural capital at mid-century has been replaced by a cultural capital based on cosmopolitan, even omnivorous, tastes. Volume 25, numbers 2 and 3 of *Poetics* are devoted to describing this changing representation of status through taste displays.

Micro, Institutional, and Societal Levels of Analysis

The production of a culture model has been formulated at the level of personal interaction, relations among organizations, and the workings of entire societies. Ideally, work at each of these levels complements work at the other two, and while this may happen in the best individual studies, the theoretical questions and research techniques employed at the three levels are different enough that research has tended to develop separately, and practitioners working at different levels of analysis do not learn all they might from each other.

The great strength of studies that explicitly take into account societal level conditions is their view of the culture industry as an expression and reinforcer of the sociopolitical system of the larger society and the attendant systems of domination and subordination, including social class, ethnicity, religion, and gender. Excellent studies can be cited. The danger in looking from the societal level is that the workings of the production process may be seen to follow automatically from the society-level constraints. This need not be the case, as exemplified in a number of empirical works, which show the way in which societal values and beliefs are mediated by the culture industries.

Production studies that focus primarily on the organizational or institutional level take advantage of the decades of studies of particular organizations, occupations, industries, and the theoretical developments in these research specialties. Because researchers want to remain value-neutral, they tend to bracket their own aesthetic and political views and use uncritically the aesthetic judgments and ideological stances implicit in the symbolic field being studied. Thus the work of these researchers helps to perpetuate the established categories of the systems they study. At the same time, their reports expose for public review the workings of the systems, which create and perpetuate self-serving classifications of a given field (cf Lamont and Fournier, 1992).

Production studies that focus primarily on the microlevel of interaction between persons draw from the rich tradition of research in symbolic interactionism, as well as from the social–psychological elements of the sociologies of occupations and organizations. The most wide-ranging and influential work in this tradition is Howard S. Becker's *Art Worlds* (1982). He shows that by bracketing societal and institutional levels of analysis, one can illustrate how groups of symbol producers create and are shaped by the conventions of aesthetic judgment and collaboration in culture production. In effect, such microlevel studies focus less on the production of culture and more on the culture of production (Fine, 1992).

Some microlevel studies can be criticized for unreflexively assuming the perspective of the group or occupational category under review, and thus obtaining an incomplete and misleading reading of the field. This 'going native' as it were is cognate to the problem of becoming an unwitting apologist for the institution under study, and the research strategy of comparison across subfields is one of the best ways of guarding against unreflexively adopting the perspective of just one of the groups in a production system.

The Production Perspective in Cognate Areas

The production perspective has proved a useful model for organizing ideas and research in a number of areas where the production of culture is itself not the conscious aim of the activity.

Reception and the Autoproduction of Culture

Reception by the reader, listener, viewer, or purchaser has always been a central concern in cultural studies. The term 'reception' suggests the end of a communication process. However, reception is an active process of selection, interpretation, and recombination of elements that can be seen as the production of a symbolic world, which is meaningful for 'consumers.' A prime question here is how people go about selecting cultural elements, and in turn, the meanings that they attach to them. This production of a lifestyle for oneself and one's group is best referred to by the Latin word for self – 'auto' thus the autoproduction of culture. The autoproductions of marginalized groups such as youth, ethnics, eccentrics, and the like have received much scholarly attention, but all individuals and collectivities create lifestyles that display their patterning of cultural choices (Peterson, 1983). A growing number of studies focus on how people of different sorts produce meaning out of mass-mediated symbols.

In the 1940s, a 'mass culture' was seen as the unreflexive response to the seductions of the mass media, dissolving the social class-based hierarchy of class cultures by which wage worker, tradesperson, business person, and farmer could readily be distinguished. While the extreme elitist alarm over massification has fewer proponents now (Gans, 1974), much of the debate since has focused on the question of the degree of fit between social class, defined in relationship to production, and culture class defined in relationship to consumption. Gans (1974) and Bourdieu (1984) assert that the fit between social class and culture class (groupings of people sharing patterns of consumption) is quite close. However, their perceptive analyses of the United States and France, respectively, reveal numerous autoproducing status groups that cannot easily be fit into a linear hierarchy.

More recent studies of autoproduction of culture suggest that most people of high status (in the United States at least) are now little concerned with the old class markers of cultural capital that centered on the appreciation of the fine arts. They no longer shun as inferior all forms of popular or mass culture (Goffman, 1951). In their study of the musical tastes of the full range of occupational status groups, Peterson and Kern (1996) suggest that the cultural symbols of class position are undergoing a profound transformation. While the top strata were earlier characterized by an elitist and exclusive interest in the fine arts and avoidance of other cultural expressions, now persons and groups show their high status as cultural omnivores, consuming not only the fine arts but also showing a knowledgeable appreciation of many, if not all, forms of cultural expression. Near the bottom of the status hierarchy, in sharp contrast to the old conception of the undiscriminating couch potato of the mass audience, they find groups who are univores, that is, people involved with a single form of cultural expression.

The systematic study of the autoproduction of culture is going forward rapidly along several fronts: (1) ethnographic studies of distinctive groups tease out the processes by which group members appropriate and incorporate cultural symbols for their own purposes; (2) other studies show the reappropriation of the mass media-disseminated pop culture by youth and other specific taste groups; and (3) population surveys with increasingly sophisticated culture questions are becoming available, making possible a much richer understanding of patterns of cultural choice.

Tradition, Collective Memory, and Boundary Formation

Early anthropologists, folklorists, and sociologists developed the idea of 'tradition' as the repository of all that is ancient and virtually unchanging. This fitted the needs of both romantics seeking the 'noble savage' and imperialists needing a rationale for ethnic and racial exploitation. In recent decades, this view has been attacked on all sides as factually incorrect and self-serving. For example, Hobsbawm (1983) in a study showing that much of the British monarchial tradition was in fact purposefully created in the middle of the nineteenth century, has coined the felicitous term 'invented tradition' to describe this kind of production of culture.

The term 'collective memory' is now often substituted for 'tradition' in recognition that the past is continually reinterpreted to fit the changing needs of the present. Some studies point to specific individuals or groups of memory 'doctors' and 'cultural entrepreneurs.' One of the most exciting applications of the idea of the mutability of collective memory has been in the study of the manipulation of memory in the service of making status distinctions along the lines of gender, race, class, etc. Gusfield (1963), in one of the earliest works of this sort, studied the role of status politics in the efforts of the (old-family Protestant) Women's Self-Temperance League to stigmatize the alcohol-use norms of immigrant Catholics. A wide array of applications of this sort of culture-production study can be found in Lamont and Fournier's (1992) anthology, *Cultivating Differences*.

Prospects

Research perspectives tend to come and go over the years, so what are the prospects for the production perspective? The numerous emerging developments described above show that the production perspective continues to gain utility for significant research and theory development. The perspective has proved an essential part of any full analysis of cultural phenomena, although some practitioners in cultural studies still do not take into account the influence of production factors. The globalization of production and the high rate of technological development as well as changes in censorship law and intellectual property rights make it all the more imperative in the twenty-first century to take into account the changing influence of production factors. Whether under the distinctive designation 'production of culture' or not, future scholars will find it rewarding to ferret out the many ways in which the system of culture production influences what culture is and what it can become.

Abstract

The production-of-culture perspective focuses on the ways in which the symbolic elements of culture are shaped by the systems in which they are created, distributed, evaluated, taught, and preserved. The perspective has flourished in the last 40 years, and scholars now study such diverse phenomena as the impact of market and industry structures on qualities of artistic objects and experiences; the characteristic features of careers, contracts, and status orders; classification and classification systems; the fabrication of authenticity; and fan cultures, taste, and collective memory.

In Richard A. Peterson's article in this encyclopedia (Culture, Production of), he noted that the production-of-culture perspective focuses on the ways in which the symbolic elements of culture are shaped by the "systems in which they are created, distributed, evaluated, taught, and preserved." In the 13 years since his article was first published, the fulcrum of activity has shifted, meriting a review of contemporary issues in the production of culture.

Briefly, the production-of-culture perspective can be traced back to Harrison White and Cynthia White's (1965) study of the emergence of impressionist art in nineteenth-century France. They argued that this new style emerged as a function of aspects of its context and method of production, of technology and training, and of features of ideology and critical discourse. This perspective has flourished since the 1970s, and scholars in multiple disciplines now use the approach established in this and other early works. Evidence of the consecration of this perspective can be found in the publication of three textbooks and two anthologies with *The Production of Culture* included in their titles (Crane, 1992; Ryan and Wentworth, 1998; du Gay, 1997; Power and Scott, 2004), and the dedication of full chapters in texts in the sociology of art (Zolberg, 1990), and in the sociology of culture (Hall and Neitz, 1993). A special issue assessing the scholarly contributions of Richard A. Peterson offered insight into the application of the approach to science, theory, art and literature, organizations, and consumption (Ryan and Hughes, 2000). An *Annual Review of Sociology* article appeared in 2004 (Peterson and Anand, 2004), a review essay in *Poetics* the following year (Janssen and Peterson, 2005), and a review issue on production perspectives solely within music (Dowd, 2004b). A year later, there was a special issue of the *Journal of Management Studies* (Jones et al., 2005).

As Peterson noted in 2001, the production perspective emerged in the 1970s largely in response to perceived weaknesses in the notion of a strict homology between culture and social structure. Rather than proposing that scholars examine the relationship of symbolic elements to social structures at (only) a macrosocial level, production-of-culture scholars focused on mesolevel structures instead – a transition of perspective broadly associated with the rise of postwar American approaches to sociological research and theory. This mesolevel focus is found in its most prescriptive form in Peterson's (1990) analysis of why rock music became a dominant form of popular music, and why it emerged in 1955. He attributed rock's rise to six production factors: law and regulation, industrial structure, technology, organizational structure, occupational careers, and the consumer market. He argued that a focus on these production factors (with minor adaptations) would allow for similar analyses of other commercial culture industries.

Yet, few studies exist with the ambition of describing a whole production system. The most notable exceptions are the works of Pierre Bourdieu that document the emergence and operation of fields (and fields of fields) of cultural production (Bourdieu, 1993, 1996). As early as 1983, van Rees noted the sympathies between Bourdieu's field theory and the (then) new production-of-culture approach, describing both as 'institutional analyses.' Among American scholars, the group of works that explore field-level phenomena include Peterson's study of rock (1990), Ferguson's study of gastronomy in France (2004), Lena's study of popular music in America (2012), Baumann's study of American art film (2007), and Gary Allen Fine's study of the production of self-taught art (2004). Most scholars focus on one aspect of the production system, the relationship between producers and consumers, or facets of work that impact the culture that is produced. In the next section, I review a few of these specific domains of research.

Dimensions of Cultural Production

To date, most studies in the production perspective have focused on particular issues: the impact of market and industry structures; the characteristic features of careers, contracts, and status orders; classification and classification systems; the fabrication of authenticity; and fan cultures, taste, and collective memory.

Market and Industry Structures

Over the past four decades, production-of-culture scholars have produced important evidence on the role of industry, organizational structure, and markets in the creation of cultural goods. This trend can be traced back to key works on the

 http://dx.doi.org/10.1016/B978-0-08-097086-8.10417-9

impacts of social structures on artistic work, including Becker's important *Art Worlds* (1982) and White and White's (1965) study of Impressionists.

For most of the twentieth century, the structure of culture industries (film, music, books, magazines, television) was an oligopoly controlled by large firms with diversified holdings across multiple markets (Hirsch, 1972; Dowd, 2004; Lena, 2006). Most scholars concluded that the culture produced under these oligopolistic conditions was dull and standardized.

Scholars disagree on the market and industry conditions that give rise to diverse music. Some argue that the decentralization of production onto subsidiary firms/organizational units can attenuate the negative effects of oligopolistic markets on musical diversity (Dowd, 2004). Others argue that new or smaller firms produce varied and dissimilar products (Peterson and Berger, 1975; Lopes, 1992).

Careers, Contracts, and Status Orders

Production-of-culture scholars often examine the ways in which careers and contracts produce status orders that influence the character and popularity of different symbolic elements. The culture industries typically employ an administrative model in which professional administrators are located in the managerial subsystem, and 'creatives' are located in the technical subsystems. Our work demonstrates that the structural organization of work weakly determines the sorts of products that can be produced.

The typical division of labor in such systems delegates budgetary decisions to administrative 'suits,' and responsibility for stimulating creativity and diversity (in the face of market uncertainty) to creatives. Since the mid-twentieth century, creative workers in such industries have enjoyed less employment security, and are likely to work under part-time or short-term contracts. As entrepreneurial or contingent labor (Neff et al., 2005), creative workers' reputations do not rest on organizational affiliation or reference to an objective rank of positions. Instead, careers advance iteratively through projects, and workers form career portfolios that ideally reflect variety, the ability to adapt, and high levels of social and economic capital (Faulkner and Anderson, 1987; Menger, 1999). Studies exist that chart careers among actors (Lincoln and Allen, 2004; Rossman et al., 2010; Uzzi and Spiro, 2005), cooks and chefs (Fine, 1992), painters and artists (Fine, 2004; Lang and Lang, 1988), authors (Janssen, 1998; Verboord, 2003; Craig and Dubois, 2010), and celebrities (Gamson, 1994).

The assessment of track records and career stages joins the characteristics known to mediate between financial rewards and peer esteem in art worlds (see Dowd et al., 2005, on gender; Dowd and Blyler, 2002, on race). Social capital and social status are keyed to generating opportunities to compete for contracts. While Becker (1982) argued that the artistic prestige of all artists is degraded by nonartistic work, including building social networks and managing finances, detailed, empirical analyses of artistic labor have revealed that high-status professionals often openly engage in these activities to no ill effect (Janssen, 1998; Craig and Dubois, 2010), and indeed, must become expert in these nonartistic activities in order to fuel the possibility of future contracts.

Status positions are allocated based on the evaluation of 'track records' (Pinheiro and Dowd, 2009: 491) and interpersonal ties (Anheier et al., 1995; Giuffre, 2001; Crossley, 2009). The resulting income distribution is rather more skewed than in other professions, and individual incomes vary more dramatically over the career than in most professions (Menger, 1999: 553). This distribution of rewards holds when the outcome measure is not income, but sales (Dowd, 2004; Lena, 2006), productivity or publication (Anheier et al., 1995; Craig and Dubois, 2010), critical success (Giuffre, 2001; Allen and Lincoln, 2004), or awards (Craig and Dubois, 2010). These 'hot' jobs in 'cool' industries are culturally desirable, but bring with them the paradox of lowered expectations of economic stability (Neff et al., 2005: 331).

There is little consensus on how the structure of career trajectories, contract types, and status orders impacts the work that results. Some maintain that demand uncertainty is so great that even markets with small numbers of elites who hoard contracts (like most contemporary culture industries) still experience stochastic shocks, such that 'all hits are flukes' (Bielby and Bielby, 1994). At least one experimental study has demonstrated that while exceptional quality guarantees at least moderate success and exceptional badness forecloses it, every other outcome is unpredictable (Salganik et al., 2006).

Classification

Interest in the prestige of cultural objects stretches back to and earlier than the start of the production-of-culture perspective. Scholars have taken a particular interest in prestige as a case of the larger class of classificatory behaviors, some of which treat symbolic elements of culture. The broadest of these, and arguably the first one to be studied by production-of-culture scholars, is the distinction between popular culture and high art, a fixture of American society since the middle of the twentieth century. The differentiation of high and low culture was driven by the class interests of rising status groups (Crane, 1992), along with the emergence of the trustee-funded, nonprofit organization (DiMaggio, 1982).

The subsequent puzzle for scholars of 'aesthetic mobility' or 'aestheticization' was to understand the mechanisms that allowed various forms of vernacular culture to be classified among the arts over the twentieth century. These include jazz (Lopes, 2002; Peterson, 2005), film (Baumann, 2001), cuisine (Ferguson, 2004; Johnston and Baumann, 2007), and 'naïve' painting (Fine, 2004). Aesthetic mobility is promoted by cultural capitalists, advantaged individuals who possess varied forms of capital that give them the power to redefine artistic classification systems and situate their tastes in privileged positions (Bourdieu, 1987, 1996). When structural transformations threaten the exclusivity of elite tastes, they simply use their familiarity with, and training in, artistic classification systems to appropriate new works into those systems, a phenomenon discovered in a range of empirical studies (DiMaggio, 1987; Lizardo and Skiles, 2012).

Production-of-culture scholars also address how categorization within industries impacts product sales and critical approval. Genre and market categories facilitate cooperation and interaction between producers and consumers because they represent sets of shared conventions, and thus constrain

producers by sanctioning deviations from these sets (Bielby and Bielby, 1994; Negus, 1999; Lena, 2012). Mixing or transgressing boundaries can inhibit success while 'categorical purity' generally enhances success (Hsu, 2006a; Zuckerman and Kim, 2003). Producers who are situated in multiple categories confuse audiences, and this lowers the appeal of their products (Hsu, 2006b); they are also seen as less able to create good products (Hannan, 2010; Negro et al., 2010). These results are mediated by aspects of organizational identity (Smith, 2011), audience characteristics (Pontikes, 2012), and features of the classification system (Ruef and Patterson, 2009). In particular, if boundaries within the system are in flux, or are weak, boundary crossing may not incur penalties and may result instead in valorization as innovation (DiMaggio, 1987; Rao et al., 2005; Hsu et al., 2012).

A core concern in studies of classification is their link to status; after all, "struggles over definition (or classification) have boundaries at stake … and, therefore, hierarchies" (Bourdieu, 1996: 159). In addition to the studies that focus on boundary drawing by large-status groups, production-of-culture scholars also focus on field-level or disciplinary boundaries. For example, Anand (2000) examines the differences between central-normative fields where professionals wield the power to attribute legitimacy and authenticity, and peripheral-competitive fields where audiences 'vote with their dollars.'

More recent studies of ranking and classification have examined various indexes, lists, and performance algorithms as cultural objects that impact the behavior of those ranked according to them. Rank ordering and other forms of performance evaluation have a tendency to cause individuals to alter their behavior in response to being evaluated, observed, or measured. Research on the insurance industry demonstrates that buying insurance increases our risk-avoidance behavior, rendering our insurance less valuable (Heimer, 1985). The general observation has been made that knowledge of theories of economic behavior shapes how individuals behave economically, a characteristic Callon (1998) calls 'performativity' (see also Latour, 1987). Anand and Peterson (2000) argue that 'market information regimes' like stock prices and bestseller lists define what counts as 'information' about the market, and this impacts what strategies participants use. For example, using market information contained in *Billboard* magazine charts, Anand and Peterson show that music industry participants change their definitions of success and may invest resources in different trends, producing large changes in the culture that is produced. Measures of law school quality are also highly reactive measures, and cause schools to make administrative and curricular decisions in order to increase their rank (Espeland and Sauder, 2007).

Authenticity

Production-of-culture scholars have sought to understand the circumstances under which cultural producers and their works are seen as 'authentic.' Most define authenticity as "the ability of a place, experience, person, or object to conform to an idealized representation of reality, that is, to a set of expectations regarding how something ought to look sound, feel, smell" (Grazian, 2003: 10). Authenticity is a social construction, a set of shared beliefs, and not an objective quality inherent in things, people, places, or experiences. Definitions of authenticity are shared within groups, but are not universalizable.

Based on this approach, authenticity can be viewed as a quality that is produced by teams of coordinated actors within a field. Scholars using the production-of-culture approach focus their attention toward the teams of musicians, managers, agents, producers, and other artistic support staff whose work is to 'fabricate authenticity' (Peterson, 1997; Hughes, 2000; Fine, 2004; Sherman, 2007). To understand how authenticity is fabricated, we often need to find the 'creator of the creator' (Bourdieu, 1996: 168). Attributions of authenticity frequently rest on aspects of particularistic categorical attributes of the creators including their race and gender, and these can be as important during the evaluative process as any of the formal features of the objects or performances they create. In addition to categorical attributes of culture creators, scholars have found that evaluations of authenticity rest on the unique, handmade, or traditional character of an item (Bendix, 1997; Beverland, 2005), its historical existence (Anand and Jones, 2005), and its geographic specificity (Johnston and Baumann, 2007; Phillips and Kim, 2009). The production of identity is the focus of studies of self-taught artists (Fine, 2004), blues musicians (Grazian, 2003), country artists (Peterson, 1997), punk musicians (Lull, 1986), rap musicians (McLeod, 1999; Lena, 2013), jazz musicians (Phillips and Kim, 2009), restaurant cooks and waiters (Lu and Fine, 1995), and foodies (Johnston and Baumann, 2007).

Fan Cultures, Taste, and Collective Memory

Reception by the listener, reader, viewer, or purchaser has been a long-standing concern in the study of culture. As Peterson (2001: 3172) noted in his article in this volume, the term 'reception' suggests the end of a communication process, but most sociologists conceive reception as an active process during which consumers select, interpret, and recombine elements. That is, they conceptualize it as a form of *production*. Instead of identifying consumers who have received the 'correct' message, we observe patterns in the meanings that they attach to them (van Rees, 1987; McDonnell, 2010). Peterson (1983) is among those who argue that this process should properly be referred to as 'autoproduction,' although such work is most often identified as research on 'identity' or 'taste.'

There are many studies that examine the production of identity through cultural consumption and participation in fan communities. The leading light is Tia DeNora, who has used interviews and observation to examine how individuals use music to invoke and manage emotion, relationships, decisions, and the like; she addresses music as a 'technology of the self' (2000).

Recent studies of class differences in taste reveal that most people of high status have dispensed with an exclusive preference for the old class markers of cultural capital (the appreciation of fine arts) and instead have diverse cultural preferences that include popular arts (Peterson and Kern, 1996). This result has been found in multiple countries including Canada, the United Kingdom, the Netherlands, France, Germany, Spain, Austria, and Australia, and in additional analyses of the United

States population (see Peterson, 2005, for a review). These studies document shifting tastes across a range of cultural pursuits including music (Bennett, 2006), reading (Zavisca, 2005), art (DiMaggio and Mukhtar, 2004; Vander Stichele and Laermans, 2006), food (Johnston and Baumann, 2007), and television (Lizardo and Skiles, 2009).

While documenting the rise in omnivorous tastes among elites, scholars emphasized that group boundaries are maintained based not "on *what* is consumed, but on *the way in which items of consumption are understood*" (Peterson and Kern, 1996: 904). It is possible that elites consuming 'middlebrow' and 'lowbrow' culture are making discriminatory judgments at the subgenre level that are missed in surveys. Johnston and Baumann's (2007) work suggests this may be the case among gastronomic omnivores; 'foodies' will eat the same foods, in the same restaurants, as others, but discriminate on the basis of their perceived authenticity. This suggests future research will seek to blend these survey results with more qualitative research and may discard genre in favor of more specific measures of consumption. Some research of this kind is taking place (Sonnett, unpublished manuscript), informed by Bourdieu's approach in *Distinction* (1987; see also Fligstein and McAdam, 2012). The obstacle to research in this area is the resource intensity of consumption at the intragenre level.

Production-of-culture scholars have also investigated the production of reputation (Van Rees and Vermunt, 1996; Barker-Nunn and Fine, 1998) and collective memory. As shared, established images of social actors, reputations emerge from a social process by which information and events are filtered through a selective lens (Lang and Lang, 1988). Certain details acquire relevance and gravity, while others are disregarded or censored out of the stories that concatenate into reputations. Thus, collective memories are reinterpretations of past people and events that harmonize them with current political needs and cultural beliefs (Halbwachs, 1992; Lang and Lang, 1988; Sewell, 1996). Media-studies scholars have offered case studies of celebrity (Gamson, 1994), media frames (Tuchman, 1978), and talk shows on television (Grindstaff, 2002) to illuminate the dynamics of mass reputations.

Prospects

Thirteen years ago, Richard Peterson focused here on the prospect of studying production factors given the globalization of production and the high rate of technological development as well as changes in censorship law and intellectual property rights. While scholars outside the United States have contributed meaningfully to understanding global production and distribution systems, and communications scholars have directed attention toward the impact of regulatory systems in the digital age on content, sociologists have turned their attention elsewhere. In particular, production-of-culture scholars and their works have been producing thousands of studies of omnivorousness, and the growing body of works that focus on product classification within industries.

While the revolution in digital technology did not spark a bumper crop of research on online distribution systems, it did encourage scholars to acquire a set of tools to examine 'big data.' We have an extraordinary capacity to evaluate large amounts of information, but only some of it is unencumbered by legal restrictions on access and use. This means we will likely see research on music and literature replaced by studies of the transformation of social media like Twitter, and scientific collaboration and citation, because data on the latter have thus far been more tractable.

Production-of-culture scholars may also be drawn to study new careers in new or rapidly transforming industries like finance. To maximize their leverage on these cases, they may benefit from collaboration with economic sociologists who already understand a great deal about how such careers work. Relatedly, these subspecialties could productively collaborate to understand new performance metrics and predictive algorithms that have rationalized finance and produced new sources of market volatility. Finally, it is time for production-of-culture scholars to dispense with older (even revised or adapted) categories of consumers and seek to understand tastes by inductively producing market segments from behavior, attitudes, and attributes.

Culture Shock

Abstract

Immersion in a foreign culture, while initially exciting, often leads to a state of emotional distress. This personal disequilibrium, brought about by encountering unexpected or disturbing differences of behavior and social expectations, and by difficulties in communication, has been termed 'culture shock' – a designation introduced in 1950 by Kalervo Oberg. Symptoms of distress may become intense, and may even lead to psychological problems. But in general culture shock is mastered by a process of adaptation to the new culture. Indeed, it may be considered a regular part of learning a culture. Some travelers, surprisingly, experience equal or even greater disorientation on return to their own culture, a condition which shows the depth of personality transformation that is brought about by adapting to a new culture.

Anyone who has spent time in a culture significantly different from his or her own has more than likely experienced a sense of disorientation and perplexity at life in the new culture. After an initial period of excitement about the novelty of the new culture and perhaps pleasure in the absence of some of the constraints of one's own society, the traveler may be plunged into a period of anxiety and frustration at the difficulty of understanding and making himself or herself understood. The visitor may feel confused by differences in expectations and in interpersonal relationships, abhorrence at some cultural practices or perceived dispositions of the people, followed by intense homesickness, depression, and perhaps regression to unaccustomed bouts of annoyance and labile feelings. Frequent manifestations include food concerns – yearning for familiar foods or anxiety about the safety of the drinking water. Such reactions on encounter with a new culture have been referred to in anthropology as 'culture shock,' a term which has been in currency since 1950, when Kalervo Oberg gave a talk of that title to the women's club of Rio de Janeiro – a group of wives of American businessmen and diplomats. Bronislaw Malinowski, although he did not use the term, gave one of the classic descriptions of culture shock in 1922, in the introduction to *Argonauts of the Western Pacific*:

> I well remember the long visits I paid to the villages during the first weeks; the feeling of hopelessness and despair after many obstinate but futile attempts had entirely failed to bring me into real touch with the natives, or supply me with any material. I had periods of despondency, when I buried myself in the reading of novels, as a man might take to drink in a fit of tropical depression and boredom.

Culture shock has been noted frequently in anthropological fieldwork. It has become a regular part of anthropological thinking about culture, especially in the USA. Yet discussion of its manifestations has been comparatively rare in anthropology, only one major book being devoted to it. Some more specialized spinoff concepts, such as Toffler's 'future shock,' have been more extensively written on. Culture shock has been best described, perhaps, in some fictional works by anthropologists and others – Laura Bohannan's *Return to Laughter* (see Bowen, 1954); E M Forster's *A Passage to India* – or in briefer introspective works by anthropologists such as Mary Catherine Bateson (1968) and Jean Briggs (1970). George Devereux's *From Anxiety to Method in the Behavioral Sciences* (1968) still remains one of the best theoretical explorations of its significance.

The earliest writings on culture shock treated it as a kind of pathology, an obstacle to smooth operation in the culture one is entering and to communicating with its people. Kalervo Oberg listed a number of 'symptoms' of this 'transitory disorder,' including: compulsive handwashing, emotional lability and excessive preoccupation with cleanliness. The psychoanalyst Gertrude Ticho, in a 1971 article, expands this list to include

> increased rigidity, fatigue, withdrawal anxiety, depression and elation, distressed obsessive neurotic-like symptoms such as over concern with the cleanliness of food and water, and hysterical reactions.

She goes on to add that

> at times, after a period of enchantment with and enthusiasm for the new culture, a hostile reaction to the people of the foreign culture ensues. This reaction becomes endowed with more global prejudices, such as 'they are lazy and untrustworthy, rigid, treacherous and sabotage progress.' The previously open-minded, outgoing 'foreigner' avoids contact with the people of the host country and withdraws to 'his own people,' if possible, thus creating an enclave within the foreign country.

'If this pattern is not reversed,' she concludes, 'the gap between the different cultures may be widened and result in a vicious circle' (Ticho, 1971: pp. 324–325).

More recently, culture shock has been seen as an essential part of adapting to an unfamiliar culture, of coming to understand ways of living and of seeing the world that are different from one's own. Recent anthropological writers have viewed the process in different ways:

(a) as a loss of one's own culture, with a resulting process of grieving or mourning the loss;

 http://dx.doi.org/10.1016/B978-0-08-097086-8.12049-5

(b) as a 'rite of passage,' a kind of 'initiation' marking the transition from membership in one culture to at least being conversant with another;
(c) as a 'resocialization' into another culture; and
(d) as a process like therapy or psychoanalysis for reorganizing one's personality, resolving old conflicts along new lines (see Kracke, 1987).

The first of these, 'mourning the loss of one's own culture,' along with the old view of culture shock as a 'transitory psychological crisis,' may be grouped together as a 'negative' view of the phenomenon, emphasizing the crisis of moving *out of* one's previous 'culture of orientation.' The last three – 'rite of passage,' 'resocialization' and the analogy with change in psychotherapy – are 'positive' viewpoints, emphasizing the transition *into* the new culture, the learning of new ways of thinking and reacting.

Phases of Culture Shock

While everyone's experience of cultural transition is unique, depending on one's own personality and past experiences, and on the cultures involved – the entry into another culture tends to develop in common stages. Unless the entry into the culture is under duress (capture, exile, or fleeing from a natural or political disaster at home), one's first experience tends to be one of enchantment or delight. One may also experience shock at aspects of the new culture like poverty, dirt (or antiseptic cleanliness), or noise and confusion (for a rural person arriving for the first time in the city); but at first, one is likely to feel curiosity about exploring the new culture. For a while, one may take pleasure in the absence of some of the constraints of one's home culture, at the warmth of emotions people express (if you come from a reserved culture), or the willingness of people to help you. After a time, frustrations begin to mount as one realizes, for example, that the directions people give may be more based on desire to be helpful than on a real knowledge of the information asked for, or that invitations are not to be taken at face value. One becomes aware of not knowing the cues for judging situations or people's intent, and finds oneself in awkward situations, or making gaffes. After a certain period, which varies from a few days to a few months, one begins to feel a certain 'culture fatigue' (as George Guthrie has termed it (Szanton, 1966) – an irritation at the accumulating aggravations which may mount to an exasperation with the culture itself.

At this point, if one does not give in to the inclination to leave, one begins the process of learning the new culture: what William Caudill (1961) calls 'resocialization.' The phases of distress and learning are reiterated in cycles as one is more and more deeply socialized into the culture, gradually approaching a phase of being more at home in it. The process is to some extent that of reconstructing one's identity, or constructing an alternate identity for one's sojourn in the culture. Over years of living in a new culture, the process may culminate in the formation of a new identity, as Garza-Guerrero (1974) suggests, combining patterns and values from one's culture of origin with patterns and values of the new one.

You Can't Go Home Again

An unexpected feature of culture shock is the dis-orientation one experiences on *returning* to one's culture of origin – a phenomenon which has been designated 'reverse culture shock' (Hertz, 1977). Many people feel even more difficulty in readjusting to their *own* culture after returning from abroad than they did adjusting to the foreign culture or cultures they have lived in. Why is this? In part, it is the phenomenon which the novelist Thomas Wolfe identified in *You Can't go Home Again:* You have been changed by your encounter with another culture, and you no longer 'fit' in the same place you did before going. You have an experience you do not share with your compatriots who remained at home. It is perhaps exacerbated by the very unexpectedness of it: you have had dreams of coming back home where everything will at last be unproblematic, and suddenly it is not.

Reverse culture shock reveals something about the nature of the culture shock experience itself: it measures the depth that one is changed by the encounter with another culture. We come back a different person from what we were; we have taken something of the other culture into ourselves, and can never again be fully at home in any one culture.

Aspects of Culture Shock: The Epistemology of Knowing Other Cultures

Culture shock may be an important, if not essential, part of the process of learning another culture, the central task of social or cultural anthropology. In a brilliant article, Mary Catherine Bateson (1968) discusses her own experience of culture shock in a very personal way. Culture shock, she suggests, is, among other things, a useful tool for recognizing where the new culture differs from one's own. Where something about the new culture annoys or angers you, disgusts you, or arouses anxiety or a sense of disorientation, that is a point where one must look for fundamental differences in assumptions about life or in conceptualizing the world. In our western culture, for example, we view death and mourning as something highly private, and avoid talking with the bereaved person about the loss for fear of intruding on their privacy. Filipino culture, which regards bereavement as something that must be worked through with others, so that friends talk openly with the bereaved about the loss, helping the bereaved person to re-experience the loss and the grief in a context of concerned support. Initially, she was shocked at the direct way in which Filipinos ask the bereaved person about the loss, often provoking tears; by the time she came to experience a deep loss of her own in the Philippines, she was prepared to find 'deeply healing' the opportunity to articulate and vent her feelings of loss.

Another view of the nature of cultures leads George Devereux (1968) to formulate a deeper view of the source of culture shock. In a psychoanalytic viewpoint, he suggests that different cultures have different 'distribution of repressions': some feelings and fantasies are acceptable and may be talked about and accepted in oneself, others are repugnant and should not be acknowledged. The latter, in general, will be repressed, or at least disavowed, by most people in that culture. If

something that is regarded as deeply disturbing and repugnant in one's own culture is considered acceptable and openly talked about in the culture you are entering into contact with, that may lead to considerable anxiety on your part. On the other hand, if something you consider normal and not anything to be ashamed of is regarded as repugnant in the culture you are going into, that may lead you to do or say things that will cause great distress to others in that culture; you may inadvertently arouse anxiety and distress, without at first understanding why.

Culture Shock and Mental Illness

Culture shock has received more attention in psychiatric and psychoanalytic literature, where the propensity of cultural estrangement to precipitate emotional problems or mental illness has been widely recognized. A number of articles have been written by psychiatrists and psychotherapists on the need for psychotherapeutic treatment for people whose culture shock has led them to emotional crisis. The Nigerian psychiatrist T. Adeoye Lambo has discussed certain psychiatric problems of African students abroad. Prakash Desai and George Coelho have written about the adaptation problems of Indian immigrants in the USA. Juana Antokoletz and many others have written on problems of Mexican and other Latin American immigrants in the USA. One of the most thorough discussions of culture shock was published by the expatriate Cuban psychoanalyst Garza-Guerrero (1974). Recently, the anthropologist George Spindler has developed a 'cultural therapy' to deal with problems of culture shock and intercultural communication.

Why is the encounter with another culture so unsettling? Perhaps it is because each encounter with a different way of life puts in question our own beliefs and values, confronted as we are with alternative ways of looking at reality or at social relationships, with different rules to guide our conduct. Each culture we come into contact with raises these issues anew, challenging new aspects of our world view and ethical standards. The depth to which these experiences disturb us is an indicator of how deeply the cultural framework we grow up in shapes our view of the world and of relations with others. It may be that this experience, the discomfort we feel in encountering another culture, is what most moves our curiosity about other cultures: the stimulus to anthropological study.

Abstract

Culture is constitutive of classical sociology and implicit in much postwar European sociology. Postwar American sociology began to consider culture in the 1970s with a focus upon arts. In the 1980s as the work of prominent European sociologists disseminated in translation, a global cultural turn began. Three approaches to cultural analysis have evolved in the last 20 years: first, culture is a quantifiable variable and amenable to the claims of science; second, drawing inspiration from French social theory culture is a practice of boundary formation and evaluation; and third, culture is a narrative read in ritual and performance.

The Problem of Meaning

Culture as an analytic category is a staple of many academic disciplines such as anthropology, literature, and history. Classical sociologists, Emile Durkheim, Max Weber, Georg Simmel, even Karl Marx, recognized culture as fundamental to society and social relations. Max Weber (1968) wrote about the logic of the cultural sciences and located sociology among them. Culture was implicit in mid-twentieth-century European sociology – much of which focused upon political economy in specific national contexts. In the *longue durée* of intellectual life, a concern with culture is relatively new to professional sociology – particularly postwar American sociology with its positivistic and scientific emphasis. Mid-century or postwar sociology, as in international politics, was, to borrow from Henry Luce, the "American Century." It was not until the mid-1970s and 1980s when the work of Jurgen Habermas, Antonio Gramsci, Michel Foucault, and Pierre Bourdieu began to circulate in translation that sociology in general and American sociology in particular became more cosmopolitan and culturally oriented.

Culture was not entirely absent from mid-century sociological studies. Talcott Parsons' work dominated this period and his 'social system' (1951) achieved equilibrium through the 'glue' of common values. Political culture formed the core of modernization studies in the 1950s and 1960s. Almond and Verba's ([1963]1989) study of 'civic culture' and Banfield's (1958) account of a southern Italian village are classic examples. These studies measured the diffusion of western values as an index of democratic dispositions. They seem quaint in the face of the massive political upheavals and cultural complexity of the late twentieth and early twenty-first century. Yet, Almond and Verba as well as Banfield have contemporary counterparts as the essays in Harrison and Huntington's (2000) anthology, *Culture Matters*, illustrate. Samuel Huntington's *Clash of Civilizations* (1996) locates culture in civilizations that are based on shared religions. Though politically conservative, these studies have value in that they point in the direction of a thick conception of culture that owes more to anthropology than to political science or sociology.

Meaning, individual and collective, is constitutive of culture. The 'cultural turn' in social science began in anthropology and to some extent British cultural Marxism in the mid-1970s (Willis, [1977]1981). In *Keywords*, a social history of concepts, British cultural critic Raymond Williams (1976) noted that culture in its original form was an agricultural term that described an action. It was a verb, not a noun. Culture, as Williams points out, became a noun, i.e., the medium in which things grow, as well as a verb in the nineteenth century. Williams' insights are worth revisiting as they underscore the dynamic as well as the sustaining dimensions of culture. It is the tension between change and sustenance (positively referred to as modernity and tradition; negatively as progress versus reaction) that lies at the core of cultural analysis.

Clifford Geertz's essays in *The Interpretation of Cultures* (1973) opened a door to cultural analysis that extended beyond his home discipline of anthropology to sociology. His essay 'Thick Description' lays out many of the core tenets of cultural analysis. Addressing the problem of meaning, Geertz describes culture as "a web of significance that man himself has spun." He argues that culture is a 'template of and for reality' – suggesting that culture is a recognizable model as well as a guide to action. He illustrates this argument with his clever analysis of a twitch and a wink. Both twitching and winking represent the same neurological phenomena – the uncontrolled movement of the muscles in the eyelid. Yet, depending on the context this movement can mean vastly different things. A wink is a playful gesture; a twitch is a sign of intense nervousness or physical disease. Mistaking the difference between a twitch and a wink could lead to awkward situations for a person who was not able to read the cultural message between the two different meanings that the muscular action conveyed. Mary Douglas (1975) in an essay on "Jokes" underscores the importance of cognition and culture. She argues that 'jokes' are subversions of collective norms and practices. Recognizing the 'subversion,' or 'getting' the joke suggests a deep understanding of a culture in its nonsubversive state.

In 1977, Pierre Bourdieu (1977) took a structuralist approach to culture when he introduced the concept of *habitus* in his *Outline of a Theory of Practice*. *Habitus* defined a structured mental space that a collective inhabited that shaped its behavior, beliefs, and practices. The cultural space of a *habitus*

could be thick or thin. However, *habitus* had a steel-trap quality that made it hard for an individual or a collectivity to transcend its limitations and definitions. Sewell (1992) in a seminal article attempted to insert 'agency' into the concept of *habitus*. Arguing that habitus was too rigid a concept, Sewell theorized cultural structures that he labeled 'schemas.' Transposition among schemas was the key to cultural knowledge and flexibility. Schemas were the deep structures of cognition and practice. The ability to 'transpose' a schema or to engage with different schemas suggested a deep cultural knowledge and is somewhat reflective of Douglas' point vis-à-vis the 'joke.' Sewell compares transposability of a schema to language. To really know a language well and the deep culture that it links to, it is necessary to speak as well as read the language. Spoken language transposes deep cultural structures into everyday knowledge.

In sum, the theorizing of these four seminal scholars converges in ways large and small. Cultural analysis, whatever method a scholar deploys, reveals several core assumptions: first, culture is contingent, context dependent, and not fixed either in time or in space; second, culture is manifested in practice – the things that people do together from speaking the same language to common behaviors and repertoires of evaluation; and third, culture is embedded in symbols or material objects or ritualized behaviors all of which provide grist for the sociological mill that form different media of communication.

This article will trace these three analytics through different sociological groups that have developed around them. Each of these groups has had widespread influence and generated voluminous amounts of research and published work. Space constraints dictate that this article will only cover the leaders in each area.

A Social Science of Culture: Comparison and Contingency

The production of culture approach (Peterson, 1976), a subset of organizational sociology that focused principally on the arts, dominated the subfield of cultural sociology in the mid-1970s. While this strain began to diminish in the early 1980s, there remains a sophisticated subset of sociologists who still engage with the arts (for example, Grazian, 2003; Roy and Dowd, 2010; Lena, 2012). In the 1980s, cultural sociologists began to broaden their horizons and to think about ways to contribute to the discussion of meaning while maintaining scientific integrity as sociologists. Cultural sociologists thought long and hard about the relation between methods and meanings, and were acutely aware of positioning themselves via quantitative sociologists.

An emerging generation of cultural sociologists wrote about methods and meaning broadly conceived (Berezin, 2014). Ann Swidler's (1986) article, 'Culture in Action' was a first step in the direction of extending cultural sociology beyond the arts. Her article engaged both Max Weber and Talcott Parsons on the subject of values. How, she asks, do values or culture shape an individual's choice of actions. Swidler develops the concept of a cultural repertoire or 'tool kit' that individuals, or collectivities, turn to pursue courses of action. The culturally competent individual or collectivity understands what repertoire or tool kit to draw upon – depending upon the situation. Contingency enters Swidler's analysis with her distinction between 'unsettled' and 'settled' lives. During periods of stability, it is difficult to entangle culture from action since there is general societal agreement as to what actions to take in any given situation. When societies become unstable due to contingent events and new paths need to be taken, the ties of culture become clearer as what is cultural becomes disentangled from purely structural elements.

Wendy Griswold's (1987a) article "A Methodological Framework for the Study of Culture" is a relevant and compelling exegesis of how cultural sociologists should address method and design. Griswold's discussion of 'parsimony, amplitude, and plenitude' as criteria for validity suggests that her goal was to push cultural sociology in the direction of scientific method. Her insistence on the necessity of comparison embedded in research design remains an important feature of rigorous cultural analysis. Her careful parsing of the elements of cultural production – intention, reception, comprehension, and explanation – still reflected a concern with artistic production. Griswold's own work focused upon the sociology of literature (for example, Griswold, 1987b).

Yet, her article on methodology opens the door to a broader array of subject matter by defining cultural objects as 'significance embodied in form.' Both of these studies reinforced the anthropological point that culture was not fixed and it varied widely by context. Tapping into those various contexts, whether temporal or spatial, was one way of doing a cultural analysis that could be both interpretive and explanatory. The influence of this approach which is broadly Weberian can be found in an array of articles that varied widely as to subject matter – for example, Alexander's work on the Holocaust (2003b) and Jensen's work on commemoration in Central America (2007).

By the 1990s, cultural sociology was becoming a mature subfield – meaning that it was established part of the discipline. What constituted culture widened as the 1980s turned into the 1990s. Cultural sociology expanded to include different subfields and distinctive conceptual approaches to the sociological study of culture began to consolidate. For example, we can identify Lamont's emphasis upon boundaries (Lamont and Molnar, 2002) and national cultural repertoires (Lamont and Thevenot, 2000); Jeffrey Alexander's (2003a) 'strong program' with its emphasis upon cultural performance; the interactional approach of Nina Eliasoph and Paul Lichterman (2003) and a new entry Stephen Vaisey's (2009) 'dual-process model.'

Culture as Practice: Comparative Method and Social Process

Michele Lamont in a series of books consolidated the role of cross-national research in cultural analysis. Lamont's work speaks to the role of culture in the process of social inequality. Emile Durkheim and Pierre Bourdieu broadly influence the theoretical form of Lamont's work. The work has three distinct dimensions; first, the issue of boundaries – how persons draw distinctions among themselves; second, national repertoires of collective practice; and third, rituals of moral evaluation and worth. The drawing of boundaries was the focus of Lamont's initial work (1992). In a series of interviews, Lamont

interviewed a random sample of middle-class men in four locations – two in France and two in the United States, one a cosmopolitan center, and a second a smaller peripheral city, and asked them how they drew distinctions between themselves and others. In America, she found that money and achievement were core values whereas in France style and bearing in the world carried more weight.

She repeated the study with a shift in focus to the working classes (Lamont, 2000). In her later study, she found that while race was salient in the American case, French workers drew heavily upon the Republican values of inclusion that formed the basis of their national political culture. Individualism was the basis of the American discourse even among working-class men. So that if a person was morally responsible, they were valued members of society independently of their race.

From these two initial studies, Lamont joined in collaboration with Laurent Thevenot (Lamont and Thevenot, 2000) and with a group of collaborators developed the concept of a "national cultural repertoire." What they found in this work was that a clearly identifiable repertoire of ideas, meanings, and practices in response to public and private events can be identified across national spaces. Thevenot in collaboration with Luc Boltanski developed another strand of this work that focused upon evaluation and justification (Boltanski and Thevenot, 1999, 2006). The argument is that the modes in which individuals and collectivities evaluate ideas, people, and events are based upon evaluations of worth. These evaluations of worth are embedded in languages of justification which can be identified depending upon the situation that is being evaluated. The language of justification forms the basis of the "normative principles which underlie the critical activity of ordinary persons" (Boltanski and Thevenot 1999: 364).

This foundation work that brings practice and agency to the field of cultural sociology has generated a corpus of work in social inequality as well as national schemes of evaluation. Annette Lareau, a collaborator of Lamont (Lamont and Lareau, 1988), used these ideas in a seminal work on the different ways that working-class and upper-middle-class children are socialized in the United States (Lareau, 2011). As Lareau demonstrates parenting styles 'concerted cultivation' versus 'natural growth' create the different interpretive scheme that children learn from an early age determines their outcomes in later life. In short, upper-middle-class children learn that the world is there for them to manage; whereas working-class children learn that they are largely victims of circumstances and their best solution is avoidance. Marion Fourcade (2011) has recently drawn out the issue of evaluation in an extended study of natural disaster in France and the United States. Focusing upon two oil spills, she demonstrates that Americans cared more about financial adjudication; whereas the French were more concerned with the destruction of the landscape.

In the early 1990s, comparative historical sociologists and political sociologists (for example, the essays in *State/Culture* (Steinmetz, 1999)) began to incorporate culture in their analyses. Multiple influences drove the political turn in cultural sociology. The 1989 revolutions in Eastern Europe reinvigorated an interest in the cultural underpinnings of democracy (Somers, 1993). Anderson's ([1983]2006) work on the nation as an 'imagined community' sparked a renewed interest in nationalism. The English translation of Jurgen Habermas' *The Structural Transformation of the Public Sphere* and the publication of Calhoun's (1992) anthology on Habermas opened new possibilities in the study of culture and politics. A series of review articles (Berezin, 1994; 1997a) written when the linking of politics and culture was novel among political sociologists identified nodal works and mapped the contours and possible trajectory of the field. Politics and culture is no longer a novel coupling. Wide-ranging empirical studies populate the field. My own work on fascist Italy (Berezin, 1997b) and European populism (Berezin, 2009) serves as one example. It represents the tip of a huge iceberg that includes work on family capitalism (Adams, 2005), nationalism (Brubaker, 1992; Kumar 2003), colonialism (Steinmetz, 2007), religion (Gorski, 2003; Zubrzycki, 2006; Lichterman, 2005), social movements (McAdam and Sewell, 2001), memory and identity (Glaeser, 2000; Olick, 2005; Spillman, 1997), as well as ethnographic accounts of American politics (Perrin, 2006; Lichterman, 1996; Eliasoph, 1998).

Culture as Ritual and Interaction

Sociologists such as Collins (2004) and Eliasoph and Lichterman (2003) have introduced the concept of ritual as they analyzed the cultural meaning of social interaction on a microlevel. Collins argues for a microfoundational account of culture based upon the microrituals of ordinary situations. Based upon extensive field work and ethnographic observation of local political groups, Eliasoph and Lichterman have developed a concept of 'group style' that governs collective political action. Alexander (2003a) offers an extended theoretical engagement with ritual in his concept of the 'strong program' in cultural sociology.

Working in the tradition of Emile Durkheim and Clifford Geertz, Alexander argued that a cultural sociology that adequately captures the complexity of social life must establish the 'autonomy' of culture. In contrast to the 'weak program' that Alexander (2003a) sees as dominating American versions of a sociology of culture, he argues, "What is needed here is a Geertzian 'thick description' of the codes, narratives, and symbols that create the textured webs of social meaning. The contrast here is to the 'thin description' that typically characterizes studies inspired by the weak program, in which meaning is either simply read off from social structure or reduced to abstracted descriptions of reified values, norms, ideology, or fetishism" (p. 13). According to Alexander, culture is a dynamic "…text that is underpinned by signs and symbols that are in patterned relationships to each other" (24).

Alexander operationalized the 'strong program' in a series of empirical studies ranging from the Holocaust (2003b) to the 2008 Obama Presidential campaign (2010). Alexander's study of the Holocaust provides an apt example of his method. The Holocaust became the term used to describe the mass murder of the Jews in the Nazi concentration camps across Europe during World War II. Over time, the Holocaust has come to represent a category of 'ontological evil.' Cultural traumas such as the organized genocide of World War II need to be publicly constructed as evil in order to be collectively recognized as such. In the public's mind, the evil of Nazism ended with World War II and the Nuremburg war trials. The significance of

the genocide emerged in a series of cultural events in the postwar period, and it was during this period that the term Holocaust gained public resonance as a bridging metaphor for evil in particular and even in general. It also became a justification for universal human rights.

In a later essay, Alexander (2004) further developed the 'strong program' by explicitly adding 'social performance' to a developing theory of 'cultural pragmatics.' Borrowing from performance theory, Alexander incorporates meaning structures, contingency, power, and materiality into cultural action. He specifies that cultural performances both 'fuse' and 're-fuse' – highlighting the malleability of meaning depending upon context. Cultural performance identifies collective representations, actors, audiences, means of symbolic production, *mise-en-scene*, and social power. These elements act in dynamic interaction with each other to produce an ongoing and changing cultural narrative that includes cultural producers and their audience.

Going Forward

Cultural analysis is decidedly more global today than when it first captured the imagination of sociologists in the 1980s. In addition to being represented in all of the major journals of sociology, there are two new journals *The American Journal of Cultural Sociology* (2013–) based at Yale and the *European Journal of Cultural and Political Sociology* (2014–) based in Europe that have institutionalized the study of culture as a subfield in global sociology. Cultural sociology is reflecting upon its methods (see essays in Berezin, 2014) and pondering its future.

We have now moved to a stage where 'big data' is making inroads in cultural analysis. Mohr and his contributors in a recent special issue of *Poetics* (2013) illustrate the utility of 'big data' to a range of cultural questions. Christopher Bail (2012) used 'big data' to good effect in a recent *ASR* article on how extraordinary terrorist threats, many of which never occur, end up due to media selection as defining the global Islamic community.

The future of cultural sociology is wide open – with a plurality of methods and a multiplicity of venues. Patterson (2014) reminds us that there is still 'sense' to be made of culture. As cultural anthropologists recognized in the postwar period, culture points to differences and similarities among groups in near and far places. The ontological status of culture is global. In sum, cultural sociology is the future.

Culture-Specific Psychiatric Disorders

Abstract

Culture influences the presentation and perception of mental distress. It also determines the labeling, idioms of distress, and explanatory models related to mental disorders. Culture-specific or culture-bound syndromes are uncommon, localized symptom patterns of mental distress. The 'exotic' non-Western classificatory histories of most of these disorders are enlightening. As culture is nonstatic, the diagnostic consistency, epidemiology, and long-term stability of culture-specific disorders require further investigation.

Introduction

Humans in all societies and cultures experience mental distress and at times mental disorders or illness. The concept of a troubled mind is universal with recognition given to more disturbing or abnormal mental experiences.

Cultures influence the way this distress is articulated whether by verbal or behavioral means. Cultural presentation of mental distress may share similarity across groups with shared history, or shared concepts of the mind and body. Similarly, these differences may be so localized or unfamiliar as to suggest a notion of a culture-specific or culture-bound disorder.

Sociologists, anthropologists, and psychiatrists have driven investigations into the mind and mental disorders across cultures. Through colonialism, psychiatrists and anthropologists from Western Europe and North America have influenced the early description and dissemination of accounts of alien and exotic presentations of mental distress they have come across or heard of.

Published descriptions of exotic manifestations of mental disorders in indigenous or native groups have fascinated clinicians and nonclinicians alike. Accounts and images of native health practice, unfamiliar idioms of distress, and treatments have permeated psychiatric literature and nosology. The medicalization of cultural expression of distress has led to a broader concept and evolution of 'cultural syndromes' and disorders in social science literature.

Culture has an enmeshed relationship with health as follows:

- Distinguishing between 'normality' and 'abnormality.'
- Etiological influence on some disorders.
- Influencing clinical presentation.
- Influencing interpretation of behaviors.
- Influencing rates and distribution of illness.
- Determining the recognition of disorders.
- Generating labels for disorders.
- Explanatory models of disorders.
- Determining treatment options.
- Determining care pathways.
- Influencing the outcome of treatment interventions.

Short History of Cultural Syndromes

Yap (1962) described culture-bound psychogenic psychoses as a way of harmonizing a wide range of disorders with a complex sociocultural influence on their presentation. In 1969, Yap renamed the concept as 'culture-bound syndromes' with recognition that not all were psychotic presentations.

These syndromes were described as "rare, exotic, unpredictable, and chaotic behaviours at their core among uncivilised people" (Bhugra and Jacob, 1997) They suggested these behaviors were described against a backdrop of Western worldviews and diagnostic systems with little appreciation of socio-environmental influences and the tolerance of symptoms within the culture, hence ethnocentric. In some instances, culturally acceptable behavior was pathologized in non-Western populations. Similarly, a contextual frame of reference was advocated for the full appreciation of unfamiliar clinical presentations (Hughes and Wintrob, 1995).

Society and Disorders

Geopolitical, economic, and health care resource availability influences the rates, distribution, and treatment of common mental disorders. As culture determines what constitutes aberrant behavior or mental disorder, it entirely permeates spheres of life of different populations.

Early descriptions of cultural syndromes emanated from the Far East as sociologists and medical anthropologists explored these parts. Reversing the Western ethnocentric lens, Type A behavior (Hughes, 1996) and bulimia (Littlewood, 1996) have been suggested as Western culture-bound syndromes. Type A personality is a driven, goal pursuant cognitive and behavioral state of cultural salience with significant time pressure and immense frustration when goals are not achieved. Explored in the cultural context, this may highlight the importance of personal achievement in 'individualistic' or egocentric societies with a greater emphasis on 'I-ness.' This would be more difficult to sustain in cultures with greater kinship or strong family links as in collectivist or 'socio-centric' societies which encourage kinship sharing time, financial, and emotional resources (Hofstede, 1980). Likewise, culture plays an important role on perceptions of body image (bulimia, anorexia nervosa, and body dysmorphic disorder) and interacts with socioeconomic factors such as food availability. These cultural values influence individuals and societal acceptance of behaviors.

The historical and contemporary status of culture-bound syndromes in current psychiatric practice is explored in this

section through more detailed reviews of 'windigo,' 'brain fag syndrome,' and 'dhat' – previously documented cultural disorders with folk, colonial, and ancient histories respectively.

Over the last half century, the descriptions and nosology of unfamiliar or exotic mental disorders have evolved in Western scientific literature and diagnostic manuals. A brief nosological list illustrates this:

1. 1962 – Ethnic or exotic psychosis (Yap, 1962)
2. Culture-bound psychogenic psychosis (Yap, 1962)
3. Culture-reactive (ICD, 10)
4. 1969 – Culture-bound syndromes (Yap, 1969)
5. 1992 – Culture-specific disorders (World Health Organization (WHO), International Classification of Diseases 10th edition, ICD 10, 1992)
6. 1994 – Culture-bound syndromes (American Psychiatric Association (APA), Diagnostic and Statistical Manual DSM IV)
7. 2000 – Culture-bound syndromes (American Psychiatric Association (APA), Diagnostic and Statistical Manual, DSM-IV-TR)
8. 2013 – Cultural concepts of distress (American Psychiatric Association (APA), Diagnostic and Statistical Manual, DSM 5)

Stability

Descriptions of some culture-bound syndromes have shown subtle changes over recent years; this would be consistent with core diagnostic features of some psychiatric disorders (e.g., personality disorders, developmental disorders) over recent decades. Furthermore, culture is not a static phenomenon and both *emic* and *etic* contributions enrich our understanding of distress across cultures. The stability of syndromes is explored in greater detail below in the section on – Validity of Culture-Bound Syndromes – Brain Fag, Windigo, and Dhat.

Bound

The concept of a disorder being bound to a specific culture is controversial and may become less relevant with increased global mobility and communication beyond geographical or loose cultural boundaries.

Hughes (1996) noted that diagnostic labels of exotic syndromes and atypical psychoses are ethnocentrically based on the premise that these disorders deviate from recognized and perhaps standard Western diagnoses.

Exotic indicates an unusual, foreign, nonindigenous, alien, or different condition. However, these differences do not ensure marked variation in psychopathology and require emic awareness from within the culture before considering unfamiliar behavior pathological.

Culture-Bound Syndromes in the Diagnostic Manuals (DSM and ICD)

ICD-10 (WHO, 1992)

The 10th edition of the International Classification of Diseases (ICD 10) of the WHO recognizes culturally uncommon symptom patterns and presentations referred to as culture-specific disorders. While diverse in characteristics, culture-specific disorders share two key characteristics, namely:

1. Difficult to accommodate in established international diagnostic categories.
2. Primary description in a particular population or cultural area and subsequent association with this group or culture.

The ICD 10 queries the position of culture-specific disorders, and the international experts argue that the differences observed in cultural disorders are a degree of variation from existing and established familiar disorders. The current associations between cultural syndromes and recognized psychiatric categories in the ICD 10 need a greater evidence base. It is anticipated that a growth in mental health research in less developed countries will contribute to this and influence the salience given to cultural issues and specific syndromes in the future ICD-11.

DSM-IV-TR (APA, 2000)

In this American classification manual, the term culture-bound syndrome denoted "recurrent, locality-specific patterns of aberrant behavior and troubling experience that may or may not be linked to a particular DSM IV diagnostic category."

Characteristics of Culture-Bound Syndromes DSM-IV-TR

1. Indigenously considered illness or afflictions – therefore a recognition within the society as a deviation from normal or healthy presentation.
2. Local names – the ascription of a specific local name to the experience of mental distress. Often in the indigenous or main language of communication and may include features of folk diagnostic categories.
3. Symptoms, course, and social response often influenced by local cultural factors – for instance help seeking, folk healing systems, and remedies based on the explanatory model of the experiences.
4. Limited to specific societies or cultural areas – this may be a geographical region, areas with shared ethnic history or identity – for instance, Ayurvedic health beliefs in Indian communities outside Asia.
5. Localized – do not span different regions therefore within circumscribed areas and not globally recognized.

DSM 5 (APA, 2013) – New Advances

The newer DSM 5 reviewed and redefined the concept of culture-bound syndromes preferring the term *cultural concepts of distress*. These cultural concepts are defined as "ways cultural groups experience, understand, and communicate suffering, behavioural problems, or troubling thoughts and emotions."

This DSM-5 review elaborated on three important cultural concepts, namely:

Syndromes – clusters of symptoms and attributions occurring among individuals in specific cultures.

Idioms of distress – shared ways of communicating, expressing, or sharing distress.

Explanations – labels, attributions suggesting causation of symptoms, or distress.

The APA manual also recognizes the controversy concerning the concept of culture-bound syndromes and the DSM 5 contends the terminology; culture-bound syndromes ignore the impact of culture on more specific experience and expression of distress. This more inclusive viewpoint questions the validity of culturally circumscribed collections of symptoms and syndromes. DSM 5 emphasizes all mental distress is culturally framed and different populations have culturally determined ways of communicating distress, coping, seeking treatment, and explanations of causality.

Both the WHO and the APA classificatory systems of mental disorders review the evidence base for nosological categories with the support of international scientific expert panels incorporating contemporary anthropological, social, and psychiatric research findings as global cultures and societies change.

Not all disorders are likely to endure rigorous scientific reviews as evidenced by changes in which DSM-IV-TR described 25 syndromes in 2000 while the DSM 5 published in 2013 explores only 9 cultural concepts of distress (culture-bound syndromes) in the light of the current research evidence. (See table below.)

For detailed reviews and historical context on presentations the early text by Simon and Hughes (1985) is insightful. The DSM IV and DSM 5 Glossaries (APA; 2000, 2013) also provide details of different culture-bound syndromes and concepts of distress.

Description of Specific Culture-Bound Syndromes/ Concepts of Distress

Ataque de Nervios ('Attack of Nerves')

This is a syndrome predominantly among persons of Latino heritage characterized by intense emotional expression of anger, acute anxiety, screaming, grief, and shouting. In addition, individuals experience heat in the chest spreading to the head and may show physical and verbal aggression. In some cases depersonalization, derealization, and memory impairment may occur with fainting or seizure-like shaking. Suicidal ideation may also manifest.

A shared feature of attacks is a presentation of being out of control.

Context: Stressful life event, for example, the death of a loved one or serious conflict with a close individual often against a backdrop of chronic difficulties.

Associated/differential disorders: Panic attack, dissociative disorder, trauma, or stress-related disorder.

Prevalence: Unknown.

Brain Fag Syndrome ('*Mental Fatigue*')

This is a culture-bound syndrome affecting West African students which is attributed to overwork. It is reported to be characterized by a loss of ability to concentrate, learn,

x – Indicates a description in the classificatory directory (ICD) or diagnostic manual (DSM).

remember, or think and usually accompanied by sensations of pain, pressure, or tightness around the head or neck and blurred vision (DSM-IV-TR, 2000).

The DSM 5 however limited the reference to brain fag to a brief illustration of symptoms of 'too much thinking' in a West African context. Initially described in Nigeria and later in West Africa and other African countries, this has been reported as a cluster of symptoms characterized by somatic, affective, anxiety, and cognitive complaints in African individuals engaged in educational pursuit or individuals involved in brain work (16).

Contemporary texts report that the term brain fag syndrome was initially coined in Nigeria following the use of the phrase 'brain fag' rooted in a form of pidgin Nigerian-English, and was an idiom of distress colloquially referring to mental exhaustion.

Context: Study, education, and mentally demanding activity.

Prevalence: Unknown.

Associated disorders: Depression, generalized anxiety disorder, somatization disorders.

Dhat Syndrome ('*Semen Loss*')

Coined in South Asia, this describes a range of symptoms attributed to semen loss. It is associated with idioms of distress

of fatigue, anxiety, impotence, weight loss, depressive mood, and multiple somatic complaints.

The core feature is distress regarding the loss of '*dhat*' – a white discharge on micturition or defecation.

Context: The cultural salience is related to the loss of *dhatu* (semen), one of seven health preserving essential bodily fluids in Hindu Ayurvedic medicine.

Prevalence: Up to 64% men attending a clinic in India with sexual complaints and 30% of male attendees of a general clinic in Pakistan (DSM-IV-TR, 2000).

Associated disorders: Depressive disorder, generalized anxiety disorder, erectile dysfunction, sexual dysfunction, and study problem.

Khyâl Cap ('Wind Attacks')

A syndrome found among Cambodian populations characterized by panic attacks, palpitations, breathlessness, dizziness, and coldness of extremities. Additional autonomic features of anxiety may be present. The key belief during episodes is one that a wind-like substance (*Khyâl*) may rise with blood in the body causing compression of the vital organs of the chest; hence respiratory symptoms and cranium with dizziness, blurred vision, or fatal fainting.

Context: Worrisome thoughts, postural hypotension, unique smells, or crowded places.

Prevalence: Unknown.

Associated disorders: Panic attacks, agoraphobia, generalized anxiety disorder, and posttraumatic stress disorder.

Nervios ('Nerves')

This is a common Latino idiom of distress referring to a state of vulnerability to stressful life events and challenging circumstances. The range of symptoms includes emotional distress, somatic complaints such as 'brain aches,' abdominal, paresthesia, tremors, and other autonomic symptoms. Individuals may be tearful and report impaired concentration and sleep difficulty.

Prevalence: Unknown.

Associated disorders: Depressive disorders, generalized anxiety disorder, dissociative disorder, psychosis, and in some cases, no mental disorder.

Shenjing shuairuo ('Weakness of the Nervous System')

A Chinese syndrome characterized by a symptom cluster of weakness such as mental fatigue, emotional expression (feeling vexed), excitement, nervous pain, and sleep disturbance. These are elucidated in the *Chinese Classification of Mental Disorders (CCMD)*.

Context: Feeling vexed involves worry and irritability associated with unfulfilled desires and internal conflict. There may be work or family stressors, unmet expectations, loss of face, and the loss of vitality.

Prevalence: Unknown.

Associated disorders: Depression, generalized anxiety disorder, phobic disorders, and posttraumatic stress disorder; 45% do not meet diagnostic criteria for a mental disorder. The symptom pattern of Shenjing shuairuo bears strong similarity to other conditions such as brain fag syndrome reported in West Africa.

Susto ('Fright')

This is based on a Latino idiom of distress in the Americas associated with misfortune and distress following a frightening event. The explanation of distress is that the soul leaves the body leading to sickness and an unhappy mood. Susuto is characterized by impaired sleep, disturbing dreams, appetite disturbance, impaired motivation, and low self-worth. Somatic complaints such as aches, pains, pallor, or gastrointestinal symptoms may be present.

Three susto subsyndromes have been described: interpersonal, traumatic, and somatic.

Context: The presentation occurs days to weeks or years following a frightening experience. These may be interpersonal situations, supernatural, or extreme natural events.

Prevalence: Unknown.

Associated disorders: Depressive disorder, posttraumatic stress disorder, and somatoform disorders.

Taijin kyofusho ('Interpersonal Fear Disorder')

A Japanese cultural syndrome characterized by anxiety associated with avoidance of interpersonal situations based on the belief that the individual does not appear adequate or is offensive to others in social situations. Some individuals are concerned about their body odor, blushing, inappropriate eye contact, and clumsy body or facial movements. There may also be concerns about body morphology or perceived malformations.

Context: Social situations and the need to maintain appropriate social norms of behavior in interpersonal hierarchies.

Prevalence: Unknown.

Associated disorders: Social anxiety disorder, body dysmorphic disorder, obsessive-compulsive disorder, and delusional disorder.

Stability of Culture-Bound Syndromes: An Exploration of Brain Fag, Windigo, and Dhat syndromes

Brain Fag – A Colonial History

Social science and psychiatric literature indicates that the term 'brain fag' emanated in the 1960s in Africa (Prince, 1960). This etymology has been disputed though, as there is historical evidence of use of the term with analogous connotations in early nineteenth-century Britain (Tuke, 1880; Gillespie, 1926, 1933; Ayonrinde, 2008a,b; 2009) and this consequently spread across the British Empire. In nineteenth-century parlance, to be 'fagged' or 'fag' indicated fatigue, exhaustion, or tiredness.

Concern about the impact of study on education was rife in post-industrial Britain in the 1800s with the growth of 'brain worker' vocations such as lawyers, book-keepers, teachers, and students.

Concern about the hazards of study and risk of nervous diseases, insanity, lethargy, and even death from 'over study' led to a groundswell of anxiety. This spread transatlantically and in the late nineteenth and early twentieth centuries, American news reports raised an alarm about an illness in

England called 'brain fag' striking British 'brain workers' and advancing toward the developing American nation.

Medical lexicons of the time defined brain fag as follows:

Brain fag: exhaustion due to overwork with the brain (American illustrated medical dictionary, 1901).

Brain fag: the effects on the brain of mental overwork (Lippincott's new medical dictionary, 1910).

About 150 years later, observations in Africa of a new cultural syndrome were as follows:

> The distinctive symptoms of the syndrome are intellectual impairment, sensory impairment (chiefly visual), and somatic complaints most commonly of pain or burning in the head and neck. In addition there are a variety of other complaints that often militate against the student's ability to study. The patients have an unhappy, tense facial expression and a characteristic gesture is frequently noted – that of passing the hand over the surface of the scalp or rubbing the vertex of the skull, especially when discussing a question that requires concentration.
>
> Prince, 1960

Symptoms presented during periods of intensive reading or study prior to or following examinations or intensive study.

> 1960s literature stated – "It is clear that the syndrome is related to 'westernization,' for prior to the 19th century when significant European influence commenced, the written word and the student life, which are so intimately bound up with the syndrome, symptoms were unknown to the inhabitants of Southern Nigeria" … "the syndrome is rarely seen in the European." Anthropological thinking of the time proposed "It would appear then that the illness is related in some way to the fusion of European learning techniques with Nigerian personality."
>
> Prince, 1960

Prince suggested that "European learning techniques emphasize isolated endeavor, individual responsibility, and orderliness – unlike the Nigerian by reason of the collectivistic society from which he derives." This historical concept is similar to the concept of 'individualist' and 'collectivist' differences in cultures derived globally by Hofstede (1980) and provides useful insight into the understanding of distinct societies.

Contemporary epidemiological evidence regarding brain fag and other culture-bound syndromes is sparse compared with other psychiatric disorders.

Since the initial description by Prince (1960), Nigerian psychiatrists have debated the relevance of brain fag. Morakinyo (1980) suggested a psycho-physiological and cognitive basis to the disorder among African students compared with nonstudents reinforcing the relevance of brain fag. Ola et al. (2009) describe a clinical tetrad of somatic complaints: cognitive impairment; sleep difficulties; and other somatic impairments with a conceptual history based on traditional medicine, psychoanalysis, biopsychological, and transcultural psychiatry etiologies. They contend brain fag is subjectively valid within a psychiatric, psychological, and sociological framework. However, other Nigerian psychiatrists (Jegede, 1983; Ayonrinde and Obuaya, 2008a,b) question the validity of this syndrome stressing it is nosologically related to depressive and anxiety disorders. All of the psychiatrists agree that the natural history, management, and prognosis of brain fag are unknown.

Syndrome?

A syndrome is a combination of signs and symptoms that form a distinct clinical entity or disorder. Individual symptoms are amalgamated by the healer or clinician based on an understanding of established patterns of presentation. In the case of brain fag, symptoms of depression, somatization disorder, and anxiety disorder occur with notable areas of overlap. With such heterogeneity of symptoms, small sample sizes and the absence of pathognomonic symptoms and signs raise doubts regarding the diagnostic validity of a study-related stress disorder. Impaired mental function is common to many mental disorders.

Culture-Bound?

The concept of culture-bound indicates a syndrome restricted to or associated with a specific culture or peoples. Brain fag has been reported in culturally distinct parts of West, North, South, and East Africa (Harris, 1981; Peltzer et al., 1998). The diverse historical, linguistic, religious, and educational backgrounds of the African countries highlight the heterogeneity of symptoms.

With an etymology rooted in nineteenth-century Britain, current use is arguably not symptom-specific, culture-bound, or unique to any geographical region. Interestingly, *Shenjing shuairuo* symptoms from China are similar to the West African syndrome.

Windigo – The Medicalization of a Cultural Myth

Mythical and historical accounts of a demonic half-man half-beast creature eating the flesh of humans caused anxiety in some regions of the United States and Canada. Folklore in which predominantly male victims developed depressive, homicidal, and suicidal thoughts with a delusional compulsion to eat human flesh were a source of intrigue. Reports indicate sufferers were socially isolated, ostracized, or slain when found. For several years, anthropologists and psychiatrists believed windigo was a culture-bound syndrome but emic understanding about 'windigo' monster myths and the social implication of the narrative led to a questioning of the legitimacy of this syndrome. Interestingly, an indirect outcome was social control and strong negative views regarding homicidal behavior in communities. Windigo is no longer referred to in contemporary literature as a 'living' disorder. Ethnohistorians and anthropologists have on the whole concluded that windigo is not a mental disorder or syndrome but a taboo reinforcing folklore (Marano, 1983).

Dhat or Semen-Loss Anxiety Syndrome – An Ancient Ayurvedic Disorder

Derived from the Sanskrit word *dhatu* (metal), *dhat* is a colloquial term for semen. In 1960, Wig described dhat syndrome

characterized by vague somatic complaints such as fatigue, weakness, anxiety, loss of appetite, guilt, and sexual dysfunction attributed to semen loss following nocturnal emissions, micturition, or masturbation.

Ancient Indian Ayurvedic texts between 5000 BC and the seventh century depict symptoms of semen loss and associated anxiety. Semen production was described as "….food converts to blood which converts to flesh which converts to marrow and ultimately to semen," a process reporting 40 days for 40 drops of food to convert to a drop of blood and 40 drops of blood to convert to a drop of flesh (Bhugra and Buchanan, 1989). The salience of semen across the Indian subcontinent cultures is strongly reinforced by these ancient descriptions and contemporary remedies promoted in newspapers, TV, and by posters on walls.

A study of dhat in North India (Malhotra and Wig, 1975) found higher rates in lower social classes, with the promotion of marriage, diet, and avoidance of masturbation, unscrupulous company, and exotic literature. Labeled the 'sex neurosis of the Orient' vulnerability was linked with beliefs regarding semen loss. Alternative therapies and Western medical interventions were sought for treatment (Malhotra and Wig, 1975).

Chadda and Ahuja (1990) studied patients complaining of dhat in their urine and found that 80% had 'hypochondriacal' symptoms, a view shared that dhat is a form of hypochondriasis. In a sexual dysfunction clinic, Bhatia and Malik (1991) found somatic complaints (physical weakness), sexual difficulties, and depression in half the patients. Janaki et al. (2012) observed that the commonest misconceptions among 24% psychiatric clinic patients was that masturbation was immoral and may lead to loss of potency. Psychosexual dysfunctions associated with dhat include erectile dysfunction (22–62%) and premature ejaculation (22–44%), and unsurprisingly both sexual dysfunction and common mental disorders accompany semen-loss anxiety (Prakash, 2007).

Dhat symptoms were also found outside the Indian subcontinent or Indian diaspora. Jadhav (2007) observed 48% of White British men with depression-linked semen retention with psychological problems and advocated a *semen retention syndrome* characterized by loss of energy, diminished libido, multiple somatic symptoms, depression, and anxiety attributed to retention of semen. Concern about semen in depressed and anxious men is not limited to Asian cultures and shares diagnostic features with other common mental disorders (Udina et al. (2013). Paradoxically, idiomatic use of dhat is a less stigmatizing means of seeking help for sexual dysfunctions from health professionals.

Male potency and virility are entwined with ideas of masculinity, symbolized by semen in some cultures, and dhat through masturbation, nocturnal emission, and the ensuing semen-loss anxiety has connotations of weakness. Historically, such anxiety about semen loss in America and Britain was revitalized with nutritional additives such as cornflakes recommended by Kellogg. In contemporary Indian society, dietary supplements and herbal remedies are offered by traditional healers to enhance virility.

The Future of Culture-Bound Syndromes

Culture-bound syndromes or culture-specific manifestations of distress continue to evolve as knowledge of different cultures increases and the shared features with established disorders are recognized. Their future as a range of disorders appears uncertain. While dhat has endured many centuries of cultural change in the Indian subcontinent, windigo is practically nonexistent, and brain fag is going through substantial nosological decline. Time and further research will determine which syndrome survives.

Impact of Urbanization

Differences in urban and rural life culture could be marked within national and geographical boundaries. In fact, some culturally diverse cities or farming communities may have more in common across borders than within. Folk illness practices are more likely to be preserved in stable rural communities than in bustling cities. The pace of industrialization in countries such as Brazil, China, India, and South Africa often requires rural to urban migration to support this growth with cheaper rural labor. Working age and predominantly male adult migration within these countries may influence family balance and cultural practices across generations.

In Japan, a new syndrome '*hikkikamori*' has been described involving teenagers becoming socially withdrawn as a way of life. It is uncertain whether this is related to social media and a response to associated pressures. This raises the question; can new cultural syndromes emerge as cultures change?

Globalization and the Cross-Fertilization of Cultures

With globalization, the ease of travel and communication has led to a more rapid flow of people, customs, and cultures. Individuals can immerse themselves in far-flung parts of the world within hours or days rather than in weeks or months. In addition, the Internet and mobile phone transmit images and information in real time globally. The advent of 24-hour news TV and real-time use of social media (e.g., Facebook and Twitter) facilitate sharing of beliefs, ideas, and values across geographical and cultural boundaries. Furthermore, large global corporations (e.g., Coca-Cola and McDonalds) transmit lifestyle and new cultural concepts as they penetrate emerging markets and influence the youth. Similarly, variations of Indian meals now have global appeal.

Examples abound on the impact of globalization on ideas of diet, democracy, fashion, sports, education, language, and interpersonal relationships to mention a few. Changes in these ingredients of culture invariably nurture 'mosaic' cultures and diversify societies. Migration trends from conflict or through economic activity often involve individuals retaining their idioms of distress and folk illness categories while acculturizing in the host country. In some countries, cultural or ethnic enclaves (e.g., China town, Asian, and African) may be found in some cities. These migrant groups may preserve health beliefs and systems from countries of origin thereby presenting challenges to health professionals unfamiliar with these.

Conclusion

Culture-bound syndromes are an important part of our understanding of mental distress and disorders around the world. Cultures impact on the pathogenesis and presentation, and therapeutic interventions cannot be underestimated. Certain psychiatric syndromes and idioms of distress are significantly influenced by cultural literacy, values, and attitudes. As cultures develop and evolve terms used to explain distress will change, absorbing new expressions and ignoring others. It is foreseeable that culture-bound syndromes will metamorphosize over time as they become less bound and more culturally influenced.

Some culture-bound or specific disorders will probably decline over time and may well become extinct whereas new ones may well emerge. The history of psychiatry and the classification of mental distress are still in evolution. As cultures change, the boundaries of normality are likely to shift and some symptoms and signs vary in salience. Attitudes to body mass, sleep, and time are shifting already. With a better appreciation of other societies, cross-fertilization of cultures, and ethnocentric shifts the impact of culture on the mind may become clearer.

Customer Satisfaction

Michael D Johnson, University of Michigan, Ann Arbor, MI, USA

© 2015 Elsevier Ltd. All rights reserved.

This article is reproduced from the previous edition, volume 5, pp. 3198–3202, © 2001, Elsevier Ltd. with an updated Bibliography section supplied by the Editors.

Abstract

Simply stated, customer satisfaction is a customer's evaluation of their purchase and consumption experience with a product, service, brand, or company. Interest in satisfaction stems from its role in affecting customers' repeat purchase decisions and subsequent company profits. As the link to profitability has become clear, customer satisfaction is now a prominent metric in business accounting and reporting. This article provides a broad overview of customer satisfaction, its meanings, and the streams of research that have emerged in recent years. Research on both transaction-specific satisfaction (a customer's evaluation of their experience with and reactions to a particular product transaction, episode, or service encounter) and cumulative satisfaction (a customer's overall experience with a product or service provider to date) is described. Methodological issues surrounding satisfaction research are also discussed. These include the choice of methods for operationalizing a satisfaction model and how to determine the importance of satisfaction drivers. The article ends with a call to better understand the psychological and behavioral consequences of satisfaction going forward. Specifically, greater attention should be given to how satisfaction, in conjunction with a company's or brand's image (reputation), and strength of relationship with customers explain customer loyalty and retention.

Simply stated, customer satisfactiosn is a customer's evaluation of their purchase and consumption experience with a product, service, brand, or company. Policy researchers have long debated the value of using satisfaction as a subjective measure of just how well a market system is able to meet customer needs (Ölander, 1977). More recent interest in satisfaction stems from its role in affecting customers' repeat purchase decisions and subsequent company profits (Johnson and Gustafsson, 2000). As the link to profitability has become clear, customer satisfaction is now a prominent business performance metric. As a result, satisfaction research has become an important component of an organization's stakeholder management, social accounting, and reporting (Gnan et al., 2013). This article provides a broad overview of customer satisfaction, its meanings, the streams of research that have emerged in recent years, and key methodological issues that surround it. The article is not meant to be a review of what has become a vast literature (see Yi, 1991). The first part of the article describes two distinct yet complementary streams of customer satisfaction research. After a brief overview of methodological issues surrounding customer satisfaction modeling, future research directions are discussed.

Two Views of Satisfaction

Customer satisfaction research has developed around two different types of evaluations: transaction-specific satisfaction and cumulative satisfaction. Transaction-specific satisfaction is a customer's evaluation of their experience with and reactions to a particular product transaction, episode, or service encounter. Early transaction-specific satisfaction research explored the cognitive-psychological antecedents of satisfaction, while more recent research has focused on the effects of positive and negative emotions on satisfaction (Oliver, 1997).

Since the early 1990s, satisfaction research has grown to include an emphasis on cumulative satisfaction, defined as a customer's overall experience with a product or service provider to date. This definition is more consistent with those in economic psychology and welfare economics, where customer satisfaction is synonymous with the concept of consumption utility. It is cumulative satisfaction upon which the prominent national satisfaction, indices, such as the American Customer Satisfaction Index (ACSI; Fornell et al., 1996), are built.

These two streams of satisfaction research are complementary rather than competing. Transaction- specific research focuses on satisfaction with a product or service on a given occasion or transaction, or over a limited period of time. In cumulative satisfaction studies, the period of evaluation is left open. In the ACSI survey, for example, customers consider all of their experiences to date when evaluating their satisfaction with a product or service. The distinction is important as it affects how one views and models the evaluations. Whereas transaction-specific models provide a rich understanding of the dynamics of product and service encounters or episodes, cumulative satisfaction provides a stable basis for determining the drivers of satisfaction and its consequences (customer retention and subsequent economic performance).

Transaction-specific Customer Satisfaction

Oliver's extensive contributions to satisfaction research over the past 20-plus years illustrate how transaction-specific research has evolved over time (see Oliver, 1997). Oliver posited that customers form preconsumption expectations, observe product performance, compare this performance with expectations, and then combine this information with expectation levels to judge satisfaction. When performance exceeds expectations (positive disconfirmation), satisfaction increases. When performance

Figure 1 The disconfirmation of expectations model.

Figure 2 The American Customer Satisfaction Index (ACSI) model.

falls below expectations (negative disconfirmation), satisfaction decreases. The disconfirmation of expectations model has dominated the literature for years; a simple version of it is presented in **Figure 1**. The direct effect of expectations on satisfaction is the result of a framing or assimilation effect; the expectations establish a baseline or anchor that directly influences the resulting satisfaction judgments. Thus attribute performance, expectations of performance, and disconfirmation of expectations may all have direct effects on evaluations of satisfaction.

The disconfirmation model has been augmented over the years to include the effects of equity, attribution, and emotions on satisfaction evaluations. The concept of reciprocity, and more specifically customer perceptions of equity and fairness, lies at the heart of marketing as an exchange process. Thus customers should be more satisfied when they are treated more fairly or equitably in a transaction, especially when there is a prospect for future transactions with the same party. Oliver and Swan (1989) posited and showed that equity is an important driver of satisfaction. Attribution theory has also been used to explain transaction-specific satisfaction from a cognitive perspective. The attribution of favorable outcomes to oneself and unfavorable outcomes to others systematically affects perceptions of performance and satisfaction (Folkes, 1990).

However, Westbrook, Oliver, and others have recognized that these more cognitive perspectives on transaction-specific satisfaction do not completely capture the more affective basis of satisfaction (Oliver, 1997; Westbrook and Oliver, 1991). Customers form both positive and negative affective states that systematically influence satisfaction. For example, on the positive side there is joy and interest, and on the negative side is anger, disgust, and contempt, which affect satisfaction as expected.

Cumulative Customer Satisfaction

Cumulative satisfaction gained momentum with the advent of national customer satisfaction indices.

Johnson and Fornell (1991) speak specifically to the problem of constructing broad-based satisfaction measures. They argue that cumulative satisfaction, as an overall evaluation of the consumption experience, should be viewed as a theoretical or latent variable (similar to an attitude). As a latent variable, satisfaction can be empirically measured and meaningfully compared as a weighted-average or index of satisfaction indicators.

The ACSI model exemplifies the measurement and modeling of cumulative customer satisfaction. The model is presented in **Figure 2** (see Fornell et al., 1996). There are three main drivers of satisfaction in the model: quality, value, and customer expectations. Satisfaction, in turn, should reduce the incidence of complaints and increase customer loyalty. Most of the survey questions are rated on 1 to 10-point scales and the measurement variables are specified as reflective indicators of the latent or abstract constructs (circles) in the model.

Of particular interest is the overall satisfaction index, which is a weighted average of three survey ratings: (1) an overall rating of satisfaction, (2) the degree to which performance falls short of or exceeds expectations, and (3) a rating of overall performance relative to the customer's ideal good or service in the category. The three measures provide a highly reliable and stable index of satisfaction. Notice that factors that may be conceptually and empirically distinct drivers of satisfaction in a transaction-specific satisfaction model become multiple measures of a more overall evaluation in a cumulative satisfaction model. Consider the differential role that disconfirmation plays in transaction-specific vs. cumulative satisfaction research. From transaction to transaction or episode to episode, one would expect some variation between performance and expectations. Service providers have a particularly difficult job of conforming to specifications on any given occasion. When these transactions or episodes are accumulated and evaluated over time, they become easier to predict. Thus significant disconfirmation, when it occurs, is more likely when studying a particular transaction or episode than when studying consumption experience to date. Because cumulative satisfaction is a more overall or molar-level evaluation, disconfirmation of expectations is one of several valuable proxies by which customers evaluate their overall experience (Johnson and Selnes, 2004).

Cumulative satisfaction is systematically related to various financial and business performance measures. Research using the national indices demonstrates the positive impact that cumulative satisfaction has on both market value and accounting returns (Fornell et al., 1996). It is no wonder that customer satisfaction has become an important part of companies' overall accounting, stakeholder management, and business performance measures. Cumulative satisfaction

research has also explored the nature of customer expectations and how satisfaction varies across industries. For example, whereas price expectations tend to be more rational, performance expectations are more adaptive; they do not adjust as quickly to changes in performance. Fornell et al. (1996) report that satisfaction is highest among goods industries, lower among services, and lower still among public and government agencies.

Methodological Issues

In customer satisfaction modeling, satisfaction plays a key role in linking customer perceptions of a product's price and quality with customers' behavioral intentions and subsequent behaviors. Companies use two essential outputs of a satisfaction model to set priorities for improvement. First, how well do products and services perform on their attributes, the benefits they provide, and the customer satisfaction and loyalty that results? Second, what impacts do the attributes and benefits have on satisfaction and subsequent loyalty? That is, how important are the attributes and benefits to customers? This performance and importance information is combined to set priorities for improvement. From a cost-benefit standpoint, the essential benefits to improve are those where importance or impact is relatively high and performance is relatively low.

As latent variables, performance levels on abstract benefits (such as the 'cleanliness' or 'convenience' of a retail store) and overall satisfaction can be constructed using weighted averages or indices of more concrete attributes or proxies. There is a debate, however, as to how to determine attribute and benefit importance measures. Many satisfaction measurement systems rely heavily on customers' direct ratings of importance. The primary advantage of direct importance ratings is that they are easy to collect and analyze. Yet direct measures assume that customers understand what is meant by 'important,' just what attributes are important to them and that they are willing to tell you. As a result, direct importance measures often result in socially acceptable or status quo answers and poor discrimination. More objective estimates of importance or impact can be obtained using statistical estimation. This statistical estimation must accommodate the fact that a satisfaction model is a network of cause and effect relationships (which predicts a pattern of relationships) that contains latent (abstract) variables. Partial least squares (PLS) and principal- components regression (PCR) are particularly well suited to estimating a satisfaction model and deriving importance measures (see Johnson and Gustafsson, 2000).

Future Research

Transaction-specific satisfaction research recognizes that customers may have very complex psychological reactions to a product's performance on a given occasion or over a given time period. Cumulative satisfaction recognizes that, when forming intentions or making decisions regarding their behavior, customers rely on their entire experience to date with a product or service provider. Yet there has been little in the way of an integration of these two perspectives. Going forward, it will be important to better understand just how satisfaction-related constructs and their relationships change when customers move from transaction to cumulative-based evaluations. There is also a need to better understand the psychological and behavioral consequences of satisfaction, specifically customer loyalty (an intention) and retention (a behavior) (Gustafsson et al., 2005).

Company or brand image (reputation) and relationship commitment (involvement or strength), when combined with overall satisfaction, should explain much greater variation in loyalty and retention than does satisfaction alone. Finally, research in the quality improvement and product development areas must strive to 'bridge the gap' between internal (organizational) quality measures and processes and external (customer) perceptions of quality and satisfaction. It is not sufficient to simply understand what attributes and benefits drive satisfaction. Companies must understand how to break customer satisfaction down into its means of accomplishment within an organization.

Cyber Crime: Identity Theft

Katie A Farina, Cabrini College, Radnor, PA, USA

© 2015 Elsevier Ltd. All rights reserved.

Abstract

Identity theft is considered to be 'one of the fastest growing crimes in America.' Due to the technological advancements and the almost ubiquitous use of computers and the Internet, identity theft is a crime that can occur practically anywhere. This article explores the various types of identity theft including medical identity theft, financial identity theft, and child identity theft. Additionally, this article highlights the prevalence of identity theft and its costs to victims both monetarily and in relation to physical and emotional stress. Finally, this article examines the recent strides of legislation to identify and combat identity theft.

Introduction

Many argue that identity thefts and cybercrimes involving fraud are considered the "fastest growing crime in America" (Cole and Pontell, 2006, p. 125). However, it is difficult for researchers and scholars to truly understand the prevalence, cost, and type of identity theft and fraud that occur, because there is not a universally agreed-upon definition (Allison et al., 2005). This varied and vague definition leads to a lack of reliable data that makes it difficult to capture the true numbers regarding the commission of this crime. This article explores several aspects of identity theft, including how practitioners and scholars define identity theft, as well as the various offenses that are considered identity theft. Additionally, current estimates of both the prevalence and costs of these crimes are considered as well as the target demographics of both victims and offenders. Moreover, a brief discussion of one of the most well-known international identity theft scams is included. Finally, this article explores the evolution of legislation meant to safeguard victims from identity thefts and assist those who are victimized.

What Is Identity Theft?

While there is no singular definition, a common theme of identity theft offenses revolves around "the misuse of another individual's personal information to commit fraud" (The President's Identity Task Force, 2008, p. 2). Crimes that have fallen under the umbrella of identity theft include, but are not limited to, checking and credit card fraud, counterfeiting, forgery, mortgage fraud, human trafficking, terrorism, passport fraud, and social security fraud. According to the United States General Accounting Office (2002), personal identifying information that can be used to commit fraud includes an individual's name, address, social security number, date of birth, alien registration number, taxpayer identification number, passport number, driver's license number, mother's maiden name, or even biometric information such as one's fingerprint, voice print, or retina image. A recent report issued by the Federal Trade Commission (FTC), which has been documenting consumer complaints and experiences for years, highlighted identity theft as the most common reported fraud among consumers. However, nearly two thirds of those who reported the victimization to the FTC did not report to local law enforcement (Federal Trade Commission, 2009).

Types of Identity Theft

According to Allison et al. (2005), the methods employed by identity thieves can best be defined based upon the degree of technology utilized. The authors first distinguish those offenders who utilize 'low technology.' Low-technology methods tend to be the most common mostly due to their relative ease. Examples include theft of wallets or purses and going through someone's trash looking for personal identifying information. A second method used by offenders is termed 'high technology.' Criminals who use high-technology methods must possess a certain degree of expertise and skill set. Their methods include the use of the Internet, skimming, and pretext calling. Skimming is the act of using computers to read and store information that is encoded onto the magnetic strip of a credit card or an automated teller machine (ATM) card. Once the offender has stolen this information, they can then place it onto a blank card thus allowing them to access the victim's bank account. Pretext calling is when offenders make contact with the victim under false pretenses with the purpose of obtaining personal information directly from the victim (Newmann, 1999). A variation of pretext calling occurs when offenders email victims pretending to be their Internet service provider and request an update to their account information and credit card accounts (Allison et al., 2005). Offenders can also obtain personal identifying information from businesses or institutions that maintain customer, employee, patient, or even student records. Identity thieves may work in jobs that allow them access to others' credit records. Offenders may pretend to offer a victim a loan, a job, or an apartment and require that the individual reveal personal information in order to 'qualify.' There are a variety of crimes that identity thieves carry out once they have a victim's information. These include taking out loans, opening credit cards, taking out cash advances and credit applications, establishing a cell phone service in the victim's name, opening a new bank account, and writing bad checks (Allison et al., 2005; Newmann, 1999).

In addition to financial identity theft, there is also medical identity theft. Medical identity theft occurs when an individual uses a victim's information to obtain medical treatment without his/her knowledge or consent. The Identity Theft Resource Center (ITRC) cautions that this type of identity theft is particularly easy as it may only require the use of an individual's name, date of birth, and address. It is also dangerous because hospitals are required to take in any emergency patients and the patient's information may not be verified as accurate before being sent to the billing department. An additional aspect of medical identity theft is related to an individual's medical history. If an offender is using a victim's information for a medical situation, the treatment, prescription drugs, or surgery the offender received will appear on the victim's medical records. As a result, the victim whose medical history has been compromised may now find it difficult to receive prescription medications or receive proper diagnoses and treatment if they require emergency attention. Once a victim of medical identity theft is contacted about these fraudulent charges, it can take months to facilitate changes or updates with insurance providers, Medicare, and/or the hospital's billing department to work out the incorrect billing (Rocha, 2013).

A subset of financial and medical identity theft is child identity theft. Child identity theft is any of the above types of theft or fraud that is perpetrated against a child. This type of theft is particularly troubling, because it often goes undiscovered for many years because children rarely have independent finances (Beltran, 2013). Children are a suitable target for identity thieves for a number of reasons. First, parents rarely check a child's credit history. Because children are unable to enter into a legal contract and should not have established credit histories, parents have little reason to suspect fraud. Second, the use of a child's identity provides offenders with a 'blank slate.' As such, offenders are presented with a wide range of fraudulent activity that they will be able to commit without raising any red flags (Beltran, 2013).

Prevalence of Identity Theft

The use of varied definitions of identity theft by official agencies has made it difficult to calculate the extent and patterns of this crime. However, both the FTC and the Bureau of Justice Statistics (sponsoring the National Crime Victimization Survey, NCVS) have each collected data in an attempt to elucidate the prevalence, costs, and forms of identity theft. Both the FTC (2007) and the NCVS (Bureau of Justice Statistics, 2011) have observed a rise in the victimization of identity theft since the new millennium. Recently, the NCVS announced that 7.0% of all households in the United States, or approximately 8.6 million households, had at least one member aged 12 or older who experienced at least one form of identity theft in 2010. This represented an increase from 5.5% of households, or 6.4 million households, that were victims of identity theft in 2005. According to the NCVS, this increase was due to a rise in the misuse of existing credit card accounts (Bureau of Justice Statistics, 2011). Similarly, the FTC (2009) claimed that identity theft was the most prevalent form of fraud committed in the United States. The most commonly reported identity thefts included credit card fraud, government documents and benefits fraud, employment fraud, phone/utilities fraud, and bank fraud. In fact, the FTC (2009) highlighted that in the past decade, credit card complaints and automobile-related complaints have nearly doubled.

The ITRC tracks data breaches by monitoring and confirming media reports of identity theft. A data breach is defined as "an event in which an individual's name plus Social Security Number (SSN), driver's license number, medical record, or a financial record/credit/debit card is potentially put at risk – either in electronic or paper format" (Identity Theft Resource Center, 2013, p. 95). In 2012, the ITRC reported 470 data breaches in the United States resulting in 17 491 690 records being exposed. It is important to note that this number is low, because not all incidents of identity theft report the amount of records exposed (Identity Theft Resource Center, 2013). Furthermore, it is pertinent to note that a breach does not necessarily indicate that an individual is a victim of identity theft. A breach signifies that an individual's information (name, address, social security number, etc.) has been compromised, exposed, and places the individual at greater risk for identity theft than the average consumer.

AllClear ID Alert Network, a privately funded organization dedicated to providing identity theft protection, released a report detailing the trends of child identity theft. In 2012, they uncovered that 10.7% of children were victims of identity theft, this number corresponding with the FTC's finding that 8% of identity theft complaints involved someone 19 years old and younger (May, 2012). The report found that children are 35 times more likely to become a victim of identity theft than an adult and that the rate of identity theft among victims aged 5 and younger has increased tremendously in the past decade (May, 2012).

Costs of Identity Theft

The inconsistent use of a definition for identity theft has made it difficult for scholars and government agencies to gauge a true count of the prevalence of identity theft. Additionally, these varying definitions hinder the ability to garner the emotional and monetary costs of identity theft to victims. It is difficult to garner a true assessment of costs incurred by victims for a variety of reasons. Usually the individual whose information has been misused is not legally responsible for any costs associated with the theft. Additionally, victims may incur expenses when they are dealing with the ramifications of having their identity stolen. For instance, identity theft victims may need to close existing accounts, open new ones, monitor credit reports, and pay higher interest rates on loans and credit accounts as a result of the theft. The individual may not have suffered a monetary cost as a direct result of the identity theft, but as a means to deal with the victimization. In fact, it took victims an average of 175 h over a span of 2 years to regain sound financial standing following a theft (Copes et al., 2010). According to Pontell et al. (2008), victims who miss work to deal with identity theft lose an average wage of $4000. Furthermore, this process of dealing with the ramifications of identity theft can take a multitude of hours and even years to overcome and consumers often experience

consequences in the interim. For instance, the consumer's credit history may be scarred leading to a denial of mortgages, loans, and bank accounts.

The NCVS and the FTC have attempted to identify both the frequency and the monetary effects of identity theft on victims, sometimes with conflicting accounts. According to the FTC (2007), over 8 million people were affected by identity theft and lost nearly $16 billion dollars. The NCVS (Bureau of Justice Statistics, 2011) surveyed victims directly and uncovered that, on average, victimized households lost $1830, while the FTC (2007) highlighted that businesses lost an average of $4800. It is important to note that this monetary loss may differ based upon the type of victimization. For instance, consumers who experience the misuse of personal information reported an average loss of $5650, while those experiencing fraud of existing accounts lost on average $1140 and finally victims of existing credit card fraud lost about $1300 (Bureau of Justice Statistics, 2011). In addition to the loss of money and time, victims may also experience physical and emotional stress such as anger, helplessness and mistrust, disturbed sleeping patterns, and a feeling of lack of security (Davis and Stevenson, 2004). The ITRC conducted a study of victims who reported mental health consequences of identity theft. In the short term, victims report feeling betrayed, defiled, and powerless; 30% of the sample experienced long-term consequences of feeling distrustful of others and 4% experienced suicidal ideations.

Identity Theft Victims and Offenders

Demographic characteristics are somewhat helpful in determining who is at risk for identity theft. According to the NCVS (Bureau of Justice Statistics, 2011), households headed by an individual 65 years or older reported the lowest rate of identity theft. Additionally, those residing in married households and households with high income levels ($75 000 or above) reported higher rates of victimization. Other studies found that the risk of victimization is highest for consumers between the ages of 25 and 54 (Anderson, 2006). However, age has become a point of contention among researchers. Recently, the NCVS has uncovered an increase in identity theft victimization among those aged 18–24. Households headed by whites, Asians, and those reporting 'two or more races' also reported the highest rates of identity theft victimization. Most victims do not know their offenders and the majority of victims believe that their information was stolen during a purchase or other transaction (Bureau of Justice Statistics, 2011). In addition to these demographic variables, analysis of the FTC's data found that households headed by women with three or more children were more likely to be victims of identity theft (Anderson, 2006). There may also be regional variation among identity theft victims. In 2011, the FTC (2012) reported that Colorado reported the highest per capita rate of fraud followed by Delaware and Maryland, while Florida reported the highest per capita rate of identity theft complaints, followed by Georgia and California.

The lack of reliable data also impacts what we know about identity theft offenders. Demographics about offenders are typically revealed through police reports and closed case files. These data revealed that nearly half of all offenders are between the ages of 24 and 34 and one-third are between 35 and 49 years old. In terms of race and ethnicity, over half were black while whites and Hispanics account for nearly 40% of offenders (Copes and Vieraitis, 2012). While research has made strides in understanding the risks of victimization, scholars have only recently attempted to understand the motivations of identity theft offenders. In one of the first studies that interviewed these offenders in federal prisons, Copes and Vieraitis (2009) examined how an offender's experiences and life circumstances affected their decision to commit identity theft. The primary motivation for committing this type of fraud was a desire for money. Offenders often viewed identity theft as an easy crime that was extremely rewarding. Often, these individuals perceived their risk of capture to be extremely low, because of their supposed advanced skills and the perceived incompetence of law enforcement. Finally, it is of interest to note that many of these offenders justified their crimes by claiming that no real harm was caused to any of their victims.

Identity Theft Legislation

Identity theft officially became a criminal act in the United States when Arizona passed the first state statute in 1996, followed by California in 1997 (Pontell, 2009). Following this legislation, the federal government passed the Identity Theft Assumption and Deterrence Act in 1998. This was the first piece of federal legislation that made identity theft a distinct crime against the individual whose identifying information was stolen. Additionally, the act declared that identity theft was punishable for up to 15 years of imprisonment and a maximum fine of $250 000. Furthermore, the US Sentencing Commission has outlined a sentence of 10–16 months of imprisonment that can be imposed regardless of an offender's previous criminal record or lack of monetary loss suffered by the victim (Copes and Vieraitis, 2009).

As the rate of identity theft continues to rise, crime control agencies have established laws that aim to increase penalties against offenders or to help victims of identity theft. In 2003, the United States Congress passed the Fair and Accurate Credit Transactions Act (FACTA). Specifically, this act was aimed to protect consumers from identity thieves and to help those who report victimization. As a result of this act, FACTA grants all consumers the right to one free credit report each year. Additionally, the act requires merchants to leave all but the last five digits of a customer's credit card number off store receipts and lenders and credit agencies to take action against identity thieves even if a consumer has not realized they have been victimized.

FACTA also mandated the creation of several national systems. The first is a system of fraud detection to increase the likelihood of discovering identity thieves. Furthermore, a nationwide system has been created that allows fraud alerts to be placed on credit files so that consumers may be notified of any unusual activity on their account. As part of this National Fraud Alert System, consumers are now allowed to place three types of fraud alerts on their credit files. The first, an initial alert, is for individuals who suspect they are, or about to become, victims of identity theft. An extended alert may be

placed on an account for an individual who has been a victim of identity theft and has filed a report with law enforcement. This extended alert lasts for 7 years wherein credit agencies may not use the consumer's name for prescreened credit or insurance offers. Finally, military personnel can now place an 'active duty alert' on their credit files when they are either serving active duty or are assigned to service away from their typical station (Fair & Accurate Credit Transactions Act of 2003, 2003). These initiatives serve as a place to assist an individual who has become a victim of identity theft.

As scholars and researchers learn more about identity theft and the various forms it may take, legislators must adjust to this changing arena. In 2004, the Identity Theft Penalty Enhancement Act enacted stiffer penalties for those convicted of an array of identity theft-related crimes as well as codified a new crime known as aggravated identity theft. Aggravated identity theft occurs when an individual "knowingly transfers, possesses, or uses, without lawful authority, a means of identification of another person" during and/or in relation to a list of over 100 felony offenses (Identity Theft Penalty Enhancement Act, 2004, p. 1). These include, but are not limited to, embezzlement, mail, bank and wire fraud, immigration fraud, passport and visa violations, social security fraud, and specified terrorism violations. Convictions of aggravated identity theft mandate enhanced penalties. According to the act, if an individual participates in identity theft during the commission of one of these listed felonies, a minimum of 2-years in prison must be served consecutively with the sentence for the underlying felony. If the identity theft occurs during and in relation to one of the more than 40 federal terrorism-related felonies, then the penalty is a mandatory minimum of an additional 5 years in prison to be served consecutively to the underlying felony (Identity Theft Penalty Enhancement Act, 2004).

In May of 2006, President George Walker Bush established a Presidential Task Force in hopes of coordinating government agencies to more effectively fight identity theft. The hopes of the task force were to identify components to make the government more adept at the awareness, prevention, detection, and prosecution of identity theft. After a 2-year investigation, the task force released a report with 31 recommendations to better assist victims and combat the crime of identity theft. They highlighted four areas where improvements should be made: data protection, avoiding data misuse, victim assistance, and deterrence. In relation to data protection, the task force called for a new culture of security among the private and public sectors. The task force called on the government to do a better job of protecting personal information, especially in relation to social security numbers, while calling on the private sector to do the same. In fact, in 2008, the United States Postal Service delivered mailings to over 146 million residences and businesses with advice on how to protect oneself from identity theft. Second, the task force also worked to make the misuse of consumer data more difficult for potential criminals. In terms of assisting victims, the task force provided identity theft training to over 900 law enforcement officers from over 250 agencies as well as victim assistance counselors to be better equipped to deal with the unique issues related to a victim of identity theft. Additionally, the task force provided grants to organizations to directly help victims while also working closely with the American Bar Association to provide pro bono legal assistance to victims of identity theft. Finally, in relation to detection and punishment, the task force proposed tougher legislation and worked with foreign law enforcement agencies to better detect, prosecute, and punish offenders (The President's Identity Task Force, 2008). Above all, the task force highlighted the ever-evolving nature of identity theft and a need for legislation and protection to evolve along with new techniques of identity theft.

Such policies that are aimed at detecting and deterring identity theft are often varied and complicated due to a lack of resources for investigation and prosecution. Additionally, identity theft is a unique crime in that cross-jurisdictional problems can often arise. For instance, it is often possible for victims and offenders to live in different states due to the use of technology. Someone's identity can be stolen remotely with the use of a computer. The nature of these crimes can lead to issues where law enforcement agencies eschew their responsibility onto another agency (White and Fisher, 2008). Partly in response to this dilemma, a second Presidential Task Force was convened in November 2009 by President Barack Obama. The Financial Fraud Enforcement Task Force (FFETF) is the broadest coalition of law enforcement agencies and regulatory services ever assembled to combat fraud. The FFETF is tasked with improving efforts between the government, state, and local crime control partners to investigate, prosecute, and punish those responsible for financial crime related to fraud. In order to assist victims of identity theft, credit card fraud, and mortgage fraud, the FFETF launched a government-run website (www.stopfraud.gov) to teach the American public about financial fraud and help victims regain any losses. In fact, the task force's Distressed Homeowner Initiative assisted over 73 000 homeowners who were the victims of mortgage and loan frauds and charged over 530 criminal defendants (Financial Fraud Enforcement Task Force, 2010).

When the 2012 legislative sessions came to a close, every state had a law that specifically outlawed identity theft or impersonation. Additionally, 29 states along with Guam, Puerto Rico, and the District of Columbia had specific restitution provisions in place for victims of identity theft, while five had forfeiture provisions set up for crimes of identity theft (Morton, 2012). While legislation to protect and assist victims of identity theft continues to grow, recent research by Piquero et al. (2011) surveyed nearly 30 000 respondents, half of which reported they would be willing to pay an additional tax if it would go toward identity theft prevention. This research finding highlights the public's growing concern with identity theft and their willingness to pay for protection.

Identity Theft: An International Example

With the increasing use of technology in identity theft offenses, this phenomenon is not confined to merely one area. The use of the Internet allows for an individual's identity and private data information to be shared instantly and over any geographical area. In fact, identity theft offenders may take advantage of different levels of law enforcement that exist between local, state, federal, and national agencies (Levi, 2008). One of the most well-known international identity theft syndicates is 'The Nigerian Letter' or '419,' so named after the criminal code against it in Nigeria (Atta-Asamoah, 2009; Levi, 2008).

While these crimes can take various forms, 419s are essentially money scams that affect individuals all over the world. Before the increased use of the Internet, those who perpetrated this offense would send letters to various residential addresses to build a relationship with a potential target and then swindle money. However, the use of technology has led to enhanced 419s wherein the offender uses a variety of tools to discover information about the target online, such as hacking into sites, scanning web pages for email addresses, and targeting victims in online chat rooms (Atta-Asamoah, 2009). Once this information has been procured, the scammer then uses the identity of the victim to scam and exploit him/her. The continued use of this tactic to commit identity fraud, money laundering, and theft has permeated West African nations so much so that it has moved from incidents committed by individuals into loosely organized networks.

Conclusion

Identity theft may not be a new phenomenon, but the prominence of the Internet and our reliance upon technology has not only allowed for an increase in such offenses, but has also changed how this crime is perpetrated. Child identity theft, medical identity theft, social security fraud, credit card fraud, and data breaches affect over 8.6 million American households yearly. The costs of these offenses are staggering. Monetary losses number in the billions and victims report feelings of betrayal, distrust, and powerlessness. The rapid development of technology and increasing use of the Internet has allowed offenders to target victims from anywhere on the globe. Scholars and practitioners alike are grappling with understanding this ever-changing phenomenon. By lacking a common definition of these crimes, it is not only difficult to measure the prevalence and costs of these offenses, but lawmakers are faced with the arduous task of creating effective legislation. Both legislators and academics have turned their interest on these crimes and are seeking to understand not only the crime itself, but how to deter such victimizations.

Cyberbullying

Elizabeth Whittaker and Robin M Kowalski, Clemson University, Clemson, SC, USA

Abstract

Since the turn of the century, researchers, legislators, the media, and public have devoted increasing attention to the topic of cyberbullying. Defined as bullying that uses electronic communication technologies (e-mail, text messages, online gaming, Web sites, chat rooms) to bully others, cyberbullying occurs throughout the world and among people with varying demographic characteristics. This article provides an overview of cyberbullying, beginning with a definition of cyberbullying and an examination of how it compares to traditional bullying. We also discuss prevalence rates of cyberbullying, characteristics of victims and perpetrators, as well as consequences of involvement in cyberbullying. We conclude with a look at prevention and intervention efforts.

Introduction

Compared to the turn of the twenty-first century when few people had heard of cyberbullying, today hardly a week goes by that the topic of cyberbullying does not appear in the media in the United States. Indeed, prior to the shootings at Columbine High School in 1999, no states had legislation even related to traditional bullying and certainly not cyberbullying. As of 2014, 49 states (excluding Montana) have some type of legislation related to traditional bullying and 35 have legislation related to cyberbullying. Since the shootings at Columbine High School, research on the topic of bullying and, subsequently cyberbullying, has surged. While this rise in research has led some to suggest that the prevalence of bullying and cyberbullying has also increased in the recent past, a plausible alternative argument is that scholars, the media, and others are paying more attention to bullying in all its forms.

One reason for the increased media attention is that both traditional bullying and cyberbullying have been shown to be related to a host of negative consequences, including suicidal ideation and suicidal behavior. One such case involved Ryan Patrick Halligan. Ryan had been traditionally bullied at school for several years. Then, after befriending a popular girl whom he liked at school, he realized that she had been sharing his personal instant messaging exchanges meant only for her with some of their classmates. The girl also verbally confronted him in person telling him that her apparent interest in him had all been a joke. Ryan committed suicide in 2003 at the age of 13 (Kowalski et al., 2012b; ryanpatrickhalligan.org).

Although the instances of cyberbullying that end in suicide are relatively infrequent, many have been picked up and sensationalized by the media. Importantly, researchers have increasingly focused on a host of other negative consequences associated with cyberbullying, as explored below. The purpose of this article is to give an overview of cyberbullying, beginning with a definition of cyberbullying (including an examination of how cyberbullying compares to traditional bullying), then exploring prevalence rates, characteristics of victims and perpetrators, the consequences of cyberbullying, and concluding with a discussion of methods of prevention and intervention related to cyberbullying.

Defining Cyberbullying

Cyberbullying, also known as electronic aggression, has generally been defined as bullying that uses electronic communication technologies (e-mail, text messages, online gaming, Web sites, chat rooms) to bully others (Kowalski et al., 2012b). However, this is a very broad definition, and defining the more specific features of cyberbullying has proven somewhat difficult.

Current Issues with Defining Cyberbullying

Researchers do not agree on how best to define cyberbullying. Several factors are involved in creating this lack of uniformity in conceptualizing cyberbullying. One of the factors complicating the development of a precise definition of cyberbullying involves the varied and changing nature of the technologies through which cyberbullying occurs. Narrowing down these electronic communication technologies used in cyberbullying situations has been problematic. Some researchers take a wide view of cyberbullying and include all electronic communication technologies in their definitions, often by simply asking participants whether or not they have experienced cyberbullying without identifying the venue by which the cyberbullying occurred. Other researchers have been more specific in naming the technologies (e-mail, social networking sites, etc.) that must be involved for the instance to be defined as cyberbullying.

This discrepancy in examining the technologies through which cyberbullying occurs may be further compounded by today's rapidly changing technology. The venues through which cyberbullying is perpetrated tend to reflect the current types of technology being used, and the venue found to be the most popular mode for cyberbullying simply reflects which type of technology is the most popular at the time. For instance, Juvonen and Gross (2008) found that message boards and instant messaging were the most prevalent venues for cyberbullying among American students ranging from 12 to 17 years of age. Statistics released by the US Department of Education's Institute of Education Sciences' National Center for Education Statistics in 2010 – just 2 years after Juvonen and Gross's (2008) study – indicated that the most

 http://dx.doi.org/10.1016/B978-0-08-097086-8.64105-3

common venue for cyberbullying among individuals 12–18 years of age was text messaging (Robers et al., 2010). Given the recent rise of social networking sites, these sites will likely emerge as primary venues of cyberbullying sometime in the near future.

The venue by which cyberbullying occurs may also influence the form that cyberbullying takes. For example, how people communicate and interact over text messages is likely different from how they interact in the comments sections of Web sites. This, too, makes it difficult to generate a uniform definition of cyberbullying that applies across situations.

Divergent conceptualizations of cyberbullying are important because they have implications for how cyberbullying is measured, as will be discussed below under prevalence rates. Different definitions of cyberbullying lead to measuring the construct differently, which leads to different prevalence estimates, outcomes, etc. For example, researchers who ask participants whether they have ever been cyberbullied will generate prevalence rates very different from investigators who ask participants whether they have been cyberbullied via instant messaging, e-mail, or online gaming, for example (Kowalski et al., 2014). Typically, prevalence rates are lower in response to global assessments of cyberbullying as opposed to questions asking about specific venues by which the cyberbullying may have occurred.

Categories

Because of all the different forms it may take (e.g., flaming, outing, and trickery; see **Table 1**), there is clearly not one monolithic form of cyberbullying. In many instances, different forms of cyberbullying have been studied together, and the relationship between the perpetrator and the victim not taken into account (see, however, Pyżalski, 2012; see **Table 1**). Several researchers have developed cyberbullying taxonomies to more fully examine the different ways in which cyberbullying occurs, as well as the different relationships between the victim and perpetrator involved in the cyberbullying incident. Two of these taxonomies are those developed by Willard (2007) and Pyżalski (2012). As shown in **Table 1**, Willard's (2007) taxonomy focuses on characteristics of the cyberbullying behavior (see also Kowalski and Whittaker, in press). Pyżalski (2012), on the other hand, developed a classification system that focuses predominantly on the relationship between the victim and the perpetrator as opposed to the behavior itself (see **Table 1**). This taxonomy may be particularly useful in instances where the victim does not know who the perpetrator is, or when the victim and perpetrator do not know each other, which often seems to be the case with cyberbullying (Kowalski and Limber, 2007).

Willard's (2007) taxonomy can be incorporated within Pyżalski (2012). Any tactic listed in Willard's (2007) taxonomy may be used to perpetrate cyberbullying against any of the targets mentioned by Pyżalski (2012). Given the number of ways in which cyberbullying can occur and the multitude of potential victims, these taxonomies provide a useful viewpoint for researchers to begin scrutinizing the question of who does what to whom under what circumstances and with what effect.

Comparison with Traditional Bullying

Conceptualizing cyberbullying has been further compounded by its perceived relationship with traditional bullying. Cyberbullying is often discussed in conjunction with traditional bullying, and the degree to which cyberbullying is similar to and different from traditional bullying, as well as the extent to which knowledge gained from traditional bullying research can be generalized to cyberbullying, are often part of this discussion. Traditional bullying is defined as an aggressive act (1) that is intended to distress or cause harm to the target, (2) that is

Table 1 Cyberbullying taxonomies

Willard (2007)		*Pyżalski (2012)*	
Category	*Definition*	*Category*	*Definition*
Flaming	An online fight	Aggression toward the vulnerable	The victims are 'weaker' people, such as homeless people or the mentally ill, and these people are often unaware of the victimization. Often includes a visual component
Harassment	Repeated, offensive messages sent to a victim	Aggression toward random people known only online	The perpetrator does not know the victim, and vice versa
Outing and trickery	Sharing personal information, without consent of the individual	Aggression toward groups	An entire group of people is victimized, examples of this may include ethnic or religious groups
Exclusion	Blocking the person from friend lists	Aggression toward celebrities	Well-known people, such as celebrities, are victimized
Impersonation	Impersonating the victim online and sending inappropriate to others as if it were being sent from the victim	Aggression toward peers	People known to the perpetrator in real life are victimized
Cyberstalking	Using electronic communications to stalk another person by sending repeated threatening communications		
Sexting	Distributing sexual pictures of others without their consent		

usually repeated over time, and (3) that occurs among people among whom there is a power imbalance. This power imbalance can be physical, social, relational, or psychological (Dooley et al., 2009; Monks and Smith, 2006).

Cyberbullying is believed to share these same three features in common with traditional bullying (Kowalski and Limber, 2007; Kowalski et al., 2012b; Olweus, 1993). Like traditional bullying, cyberbullying is an act of aggression; it occurs among individuals between whom there is a power imbalance; and the behavior is often repeated. However, although the power imbalance with cyberbullying can be of a physical, social, or relational nature, as with traditional bullying, it may also reflect differences in talents or abilities of the victim and perpetrator, such as technological expertise (Dooley et al., 2009). The repetitive nature of cyberbullying can take a number of different forms. A single aggressive text or message sent to multiple people, or posted where many people can see, is repetitive in nature, and a single aggressive post may be viewed repeatedly by the target. Finally, a target may ruminate on cyberbullying that has already been experienced as he or she anticipates when the next derogatory text message or the Internet message will be posted.

Although traditional bullying and cyberbullying share several features in common, there are fundamental ways in which the two types of bullying differ from each other. Although people are rarely as anonymous online as they believe themselves to be, perpetrators of cyberbullying often perceive themselves as anonymous, and research on deindividuation shows that people will say or do things anonymously that they would not say or do in face-to-face interactions (Diener, 1980). This perceived anonymity opens up the pool of individuals who might perpetrate electronic aggression, as those who would never bully another person face-to-face may find it easier to do so online. The perceived anonymity of the perpetrator can also leave the victim feeling powerless, as he or she is unable to identify who is behaving aggressively online. This feeling of powerlessness on the part of the victim plays into the power imbalance between the perpetrator and the victim.

The anonymity inherent in some of these interactions plays another role as well. In instances of traditional bullying, the impact of the bullying behavior on the victim can be directly observed, and, for some perpetrators, the recognition that they have hurt the victim is enough to discourage further instances of bullying. This direct observation of the effects of bullying on the victim is not possible in instances of cyberbullying because of the online nature of the interaction that impairs chances of empathy and remorse on the part of the perpetrator (Kowalski et al., 2014).

Another difference between cyberbullying and traditional bullying involves the accessibility of the victim. Traditional bullying typically occurs at school during the school day (Nansel et al., 2001), but cyberbullying can occur 24 h a day, 7 days a week. At any time, an individual who engages in cyberbullying can create malicious posts, send messages, or create mocking Web sites. Even if the target chooses not to view the messages, that does not mean that the perpetrator is not leaving them or that other people are not viewing them. In addition, because of the nature of the venues through which cyberbullying occurs, the cyberbullying has the potential to reach a much greater audience than instances of traditional bullying do. Thousands of people can view insults posted online, whereas a few dozen at most may be witness to a traditional bullying incident at school.

This may be compounded by the perceived uncontrollability of the Internet. Online communication is rarely regulated by a moderator who will intervene if an interaction becomes aggressive, whereas bystanders in a face-to-face situation *may* be more likely to intervene in a bullying situation (Kowalski et al., 2013b). The relative permanence of online posts also conveys a measure of uncontrollability to the Internet. Messages remain on certain types of media for extended periods of time, or until they are deleted. Even then, there is the possibility that someone has downloaded the message, or reposted it elsewhere without the subject's knowledge. Once something is out there in cyberspace, there is no real way to control what happens to it.

To examine the degree to which traditional bullying and cyberbullying are related to one another, several researchers have empirically tested the relationship between the two types of bullying. Results of these investigations have been mixed. Some degree of overlap has been observed between the victims of traditional bullying and cyberbullying, as well as between the perpetrators of cyberbullying and traditional bullying (Gradinger et al., 2009; Hinduja and Patchin, 2008). However, other researchers have observed weaker relationships between cyberbullying perpetration and traditional bullying perpetration (Varjas et al., 2007). A relationship between traditional bullying victimization and cyberbullying perpetration has been identified as well (Hinduja and Patchin, 2008), suggesting that some individuals may engage in cyberbullying to retaliate for prior traditional bullying victimization. As will be discussed later in this article, this question of the degree of overlap between traditional bullying and cyberbullying is an important one. For example, to the degree that the two types of bullying co-occur together, researchers must ascertain the unique contributions of each to the negative consequences experienced as a result of involvement in both traditional bullying and cyberbullying.

Prevalence Rates

Determining the frequency with which cyberbullying occurs is difficult as prevalence rates are highly variable across studies. Reported prevalence rates differ from study to study as a function of whether or not a definition of cyberbullying is provided, the time frame used to assess prevalence rates (has cyberbullying occurred within the past 2 months, 6 months, 1 year, lifetime?), the stringency of the criteria used to assess prevalence (at least once vs twice to thrice a month or more), the venue by which the cyberbullying is said to occur, demographic characteristics of the participants sampled (gender, age, race), and so on. This variation has led to something of a debate in the literature concerning whether or not the rates of cyberbullying are remaining more or less constant (Olweus, 2013), or increasing with changes in technology (Slonje and Smith, 2008).

Prevalence rates are typically estimated to be somewhere between 10 and 40% (Lenhart, 2010; O'Brennan et al., 2009).

Nonetheless, there have been several instances where much higher prevalence rates have been found. For example, Juvonen and Gross (2008) found that 72% of those sampled reported being victimized online. However, in that study, the term cyberbullying was not used, and participants were instead asked how often they had experienced 'mean things,' defined as "anything that someone else does that upsets or offends someone" (p. 499). This particular definition may be somewhat less specific than other definitions, possibly leading to the findings of increased prevalence rates.

The variation of prevalence rates from study to study may be influenced in part by the venues used to assess cyberbullying. The measurement items used to assess cyberbullying typically reflect recent trends in technology use at the time of data collection. As previously mentioned, the venues through which cyberbullying most commonly occurs tend to reflect the prevailing forms of technology at that particular point in time. Venues that are extremely popular at one point in time may quickly fall out of favor and, as a result, cyberbullying prevalence rates may rapidly decrease on these venues, while simultaneously increasing at equally rapid rates on the new popular venue. For example, as social networking sites, such as Twitter and Facebook have become more popular in use, they will likely become more frequent venues for cyberbullying. Prevalence rates also vary across studies in relation to demographic characteristics of each sample assessed, such as age, gender, and race.

Variations by Age, Gender, Race/Ethnicity, and Rural/Urban Samples

Age

Cyberbullying is often thought to be a problem of middle school students, and there is no doubt that electronic aggression is a problem in middle school, particularly when compared to younger aged samples. For instance, the Fight Crime telephone survey conducted using a nationally representative sample throughout the United States found that younger students were less likely than middle school children to have experienced cyberbullying, as either victim or perpetrator (www.fightcrime.org). However, three points are noteworthy. First, the perception that cyberbullying is a 'middle school' phenomenon is distorted by the fact that the majority of the research to date has been conducted using middle school samples. Second, research shows that cyberbullying is, indeed, alive and well in college and other adult samples (Kowalski et al., 2012a). Third, even among middle school populations, there is significant variation in both the prevalence and venue of cyberbullying (Kowalski et al., 2012b; Tokunaga, 2010). In particular, sixth grade boys appear to lag behind in the use of technology and experiences with cyberbullying. By eighth grade, however, gender differences in cyberbullying experiences have leveled out (Kowalski and Limber, 2007). Unfortunately, age differences in prevalence rates of cyberbullying will likely decrease as children gain experience with technology at younger and younger ages.

Gender

Another demographic factor that has been examined in relation to cyberbullying prevalence rates is gender. Gender differences in experiences with cyberbullying, either as perpetrator or victim, are currently fervently debated. Males are typically thought to engage in more direct forms of aggression, whereas females may prefer to engage in more indirect forms of aggression (Kowalski et al., 2012b). Because cyberbullying has been identified as a form of indirect aggression, the finding in several studies that females are more likely than males to engage in cyberbullying behavior is relatively unremarkable (Kowalski and Limber, 2007; Robers et al., 2010; Tokunaga, 2010).

However, this finding that cyberbullying is more prevalent among girls than boys is inconsistent across studies. Additional studies found no differences between males and females in their *overall* experience with cyberbullying (Hinduja and Patchin, 2008; Slonje and Smith, 2008). Among some of these studies, however, a few found sex differences in the venues through which the cyberbullying was perpetrated. For instance, a study conducted by Hinduja and Patchin (2008) found that females were more likely than males to be targeted via e-mail, even if the overall prevalence rates of cyberbullying among males and females did not differ.

Yet other research has found that males are more likely to perpetrate cyberbullying whereas females are more likely to be the targets of cyberbullying (Sourander et al., 2010). Clearly, at this point in time, evidence regarding gender differences in experiences of cyberbullying is highly variable. This variability may be due in part to measurement differences in the individual studies exploring these differences. Therefore, caution may be in order when it comes to drawing conclusions regarding the relationship between cyberbullying and gender.

Race/Ethnicity

Relative to other demographic variables, race and ethnicity have been vastly understudied in terms of their relationship with cyberbullying. Two studies, however, that did examine racial differences in involvement with cyberbullying found little effect of race (Hinduja and Patchin, 2008; Ybarra et al., 2007). In considering how race and ethnicity relate to cyberbullying experiences, it is important to remember that race and ethnicity are not immediately observable in the virtual world. As such, race and ethnicity may not necessarily be related to cyberbullying behavior with regards to victimization (Kowalski et al., 2012b; Kowalski et al., 2014). If one cannot determine a person's race online, that person cannot be targeted for his or her race. As far as perpetration is concerned, online status may not be as heavily influenced by factors such as racial group membership to the same degree that it is in the nonvirtual world, so race may also be less likely to play a role in perpetrating cyberbullying as well (Kowalski et al., 2012b). Naturally, however, to the degree that cyberbullying develops in relationships formed in the 'real' as opposed to the 'virtual' world, racial and ethnic targeting may be already extant, making overt online identification of race and ethnicity unnecessary. Additional research is needed in this area.

Rural/Urban Samples

Attention has recently been paid to differences in cyberbullying prevalence rates in rural vs urban environments. However, the findings are contradictory. One study, for example, found prevalence rates of cyberbullying to be higher than expected in

three rural Appalachian Schools (Dulmus et al., 2004). They attributed this higher prevalence rate to rural teachers and parents talking to students involved in cyberbullying less frequently than urban teachers. Alternatively, Bauman (2010) found cyberbullying prevalence rates in schools in a rural southeastern Arizona community to be much lower than expected based on previous literature. This dichotomy between findings presented by these studies highlights the need for further research on the topic to fully parse out the relationship between cyberbullying and rural vs urban settings.

Characteristics of Victims and Perpetrators

Although demographic variables are important to consider in relation to involvement in cyberbullying, a myriad of person and situational variables are related to involvement in cyberbullying for both victims and perpetrators. Compared to individuals not involved with cyberbullying, victims score lower on measures of social intelligence (Hunt et al., 2012), they spend more time online, and they engage in riskier behaviors when they are online, such as disclosing more personal information online (Görzig and Ólafsson, 2013). The observation that victims of cyberbullying are more likely to use e-mail, instant messaging, online shopping, blogging, surfing the Internet, personal pages, and gaming than nonvictims suggests that there may be individual differences in lifestyle choices of victims compared to those not involved with cyberbullying (Kowalski et al., 2012b).

Additionally, targets of cyberbullying demonstrate higher levels of depression, anxiety, and suicidal ideation, as well as lower levels of self-esteem, than those uninvolved in cyberbullying (Kowalski et al., 2014; Kowalski and Limber, 2013). However, caution should be exercised when examining these psychological variables as possible predictors of cyberbullying, as it is also plausible that these psychological variables are consequences of previous traditional or cyberbullying victimization that set targets up to be further victimized in the future. Further longitudinal research is currently needed to explicate these effects.

Victimization and perpetration have both been associated with academic difficulties such as disliking school, poor performance in school, increased rates of absenteeism, and concentration problems (Kowalski et al., 2014; Kowalski and Limber, 2013). Perpetrators of cyberbullying also show lower levels of empathy, particularly cognitive empathy, and higher levels of narcissism than those uninvolved in cyberbullying (Kowalski et al., 2014). Perpetrators also typically report higher levels of depression and anxiety, as well as lower levels of self-esteem, similar to what victims of cyberbullying report (Kowalski et al., 2014). Much like targets, perpetrators of cyberbullying are more likely to spend a disproportionate amount of time online when compared to those not involved in cyberbullying in some way (Hinduja and Patchin, 2008). This increased use of the Internet may help explain the increased technological proficiency reported by perpetrators.

In addition to these psychological variables, perpetrators also typically exhibit a multitude of other negative behaviors compared to those uninvolved with cyberbullying. These maladaptive behaviors include higher rates of alcohol and drug use, more run-ins with law enforcement, and a higher rate of physical altercations (Kowalski et al., 2014; Ybarra and Mitchell, 2004). Some of these maladaptive behaviors may stem from the values and attitudes of cyberbullying perpetrators. Relative to those not involved with bullying, perpetrators of cyberbullying demonstrate moral approval of bullying (Williams and Guerra, 2007) and the ability to morally disengage and minimize the negative impact of their behavior on others (Bandura, 1999).

Both cyberbullying victimization and perpetration appear to be inversely related to support from friends and parents, as well as a positive school climate, as would be expected (Fanti et al., 2012). Not surprisingly, youth whose parents more closely attend to their online activities and who communicate with them about the Internet safety show lower cyberbullying victimization rates (Wade and Beran, 2011). As far as cyberbullying perpetration is concerned, youth who report having poor relationships with their parents as well as low levels of parental support tend to exhibit higher levels of cyberbullying perpetration (Wang et al., 2009).

Importantly, many of the variables that have been identified as risk factors or protective factors for cyberbullying are similar to those that are related to involvement in traditional bullying. Thus, practitioners and school personnel can use some of what we know about traditional bullying to inform efforts at preventing and cyberbullying.

Consequences of Cyberbullying

While suicide is one of the most frequently discussed potential outcomes of cyberbullying, particularly in the media, cyberbullying victimization is related to a host of other physical and psychological problems. These problems include suicidal ideation, depression, low self-esteem, anxiety, loneliness, somatic symptoms, school absences, poor school performance, and drug and alcohol use (Hinduja and Patchin, 2008; Kowalski and Limber, 2013; Ybarra and Mitchell, 2004). Victims of cyberbullying are not the only ones to potentially suffer negative effects, and being a perpetrator of cyberbullying has been associated with drug and alcohol use, loneliness, anxiety, depression, low self-esteem, and poor academic achievement, as well as higher levels of loneliness (Ybarra and Mitchell, 2004). These outcomes are similar to the outcomes reported in conjunction with traditional bullying.

To date, most of the literature examining the effects of involvement in cyberbullying has, not surprisingly, focused on victims. The extent to which the effects listed above occur depends on a number of variables including how often the cyberbullying occurs, the venue by which the online aggression is perpetrated (some venues are more public and potentially more damaging than others), and the individual's ability to appraise the situation as nonthreatening or as posing a potential for growth.

In addition, involvement in other types of bullying besides cyberbullying would contribute to determining how negative the effects of cyberbullying would be. Many youth who are involved in cyberbullying are also involved with traditional bullying, as either the perpetrator or the victim. As mentioned previously, the outcomes of cyberbullying have been found to

be similar to the outcomes reported in studies of traditional bullying, and, as a result, it is often difficult to clearly disentangle the negative effects of cyberbullying from the negative effects of traditional bullying (Olweus, 2013). However, a multitude of youth are involved in either traditional bullying or cyberbullying independently of the other form of bullying, and many experience a host of negative outcomes, including suicide in a few unfortunate instances. Hinduja and Patchin (2010) observed that suicide attempts were 1.9 times higher among victims of cyberbullying and 1.5 times higher among cyberbullying perpetrators. Additionally, Kowalski et al. (2013a) found that cyberbullying accounts for unique variance above and beyond traditional bullying in predicting negative outcomes associated with victimization.

Prevention and Intervention

While it is unreasonable to expect that incidences of traditional bullying and cyberbullying will ever be completely eradicated, there are measures that can be taken to reduce the frequency with which these behaviors occur and the harmful effects that they produce. Importantly, however, it is not solely the job of parents or school administrators to accomplish the task of reducing bullying prevalence. Rather, a community-wide effort is needed that includes students, parents, teachers, school administrators, and community members. At the school level, assessments of the prevalence of traditional bullying and cyberbullying need to be conducted. Through these assessments, schools can more readily target their prevention and intervention efforts. Bullying prevention and intervention programs need to be incorporated into the school curriculum so that they are discussed on a regular basis, and the consequences for engaging in the behaviors are both clear to the students and enforced.

Parents, first, need to become aware of the warning signs that accompany both traditional bullying and cyberbullying: depression, anxiety, withdrawal from normal social activities, and poor academic performance. With cyberbullying in particular, parents need to watch for signs that their child(ren) is/are becoming upset after being online or receiving text messages. In addition, parents need to educate themselves about their child's online activities. Whereas today's youth are digital natives, and have spent the majority of their lives thinking nothing of using technology, parents are digital immigrants, sometimes knowing almost nothing about the use of technology. Parents can learn a lot from their children about technology and what their children are doing online by asking them and communicating with their children about what is 'trending' online.

With both traditional bullying and cyberbullying, many students report that they have witnessed bullying behavior within recent months (Kowalski et al., 2013b). These students need to be encouraged to take a more active role as the bystander and intervene on behalf of the victim. Bystanders are, not surprisingly, reluctant to intervene for fear that the cyberbullying behavior will subsequently be directed toward them. However, there are other things the bystanders can do to intervene on behalf of the victim, such as telling someone in a position of authority that the cyberbullying behavior is occurring.

Finally, much more research is needed in the area of cyberbullying to inform these prevention and intervention efforts. Prevention and intervention programs are not a one-size-fits-all model. For example, the programs implemented in rural areas may differ from those that work most effectively in urban areas. Those that work with youth in high school may differ from those that are effective with youth in middle school (Limber et al., 2009a,b). Research that examines the unique cyberbullying experiences of individuals in different settings will inform these efforts.

Future Research

As noted throughout this article, much research remains to be conducted on cyberbullying. A few of these research areas will be mentioned here. As much as remains to be learned about risk and protective factors related to cyberbullying victimization, even more remains to be learned about predictors of cyberbullying perpetration. Additional research is also needed examining prevalence rates of cyberbullying across a wider age demographic than just middle school students. As children at younger and younger ages become exposed to technology, researchers need an understanding of prevalence rates of cyberbullying among preschoolers, for example. They also need to examine the forms that cyberbullying takes place among older populations, particularly within the workplace. Finally, a great deal of research is needed in examining the best way to define and measure cyberbullying. For a detailed discussion of future research suggestions, the reader is referred to Kowalski et al. (2014).

Cybernetics

Andrew Pickering, University of Exeter, Exeter, UK

Abstract

This article reviews developments in cybernetics from the 1940s to the present, focusing on the most radical threads, those that foreground key questions of agency, performance, and emergence. It explores cybernetic intersections with fields including science and technology studies, brain science, psychiatry and antipsychiatry, biological computing, management, the environment, the arts, architecture, nonmodern spirituality, and the counterculture of the 1960s. It concludes with a discussion of the politics of cybernetics.

After a long prehistory spanning many fields, cybernetics was born in the early 1940s, around the time of World War II and officially named by Norbert Wiener in 1948 in his famous book, *Cybernetics, or Control and Communication in the Animal and the Machine*. Often identified with the Macy conferences held in the United States between 1946 and 1953, cybernetics also flourished in Britain (Pickering, 2010a), Europe, and the Soviet Union. Its visibility peaked in the 1960s to be followed by a gradual decline, and the word 'cybernetics' largely fell out of use – except as the root of words like 'cyberspace' and 'cyborg' – though lines of recognizably cybernetic work have propagated forward to the present, often under other names (Pickering, 2010a). In the third millennium, however, cybernetics is enjoying a renaissance in the social sciences, as well as the natural sciences, the humanities, and the arts.

Cybernetics has always been a hard field to pin down. Wiener presented it a synthesis of work in digital computing, information theory, and feedback control. As such, it represented a new kind of science, devoted to immaterial elements such as 'bits' of information rather than the material substances that define traditional sciences like physics, chemistry, and biology. Again, in contrast to the traditional organization of knowledge, cybernetics was strongly interdisciplinary. The Macy conferences brought anthropologists, sociologists, psychologists, and psychiatrists together with natural scientists, mathematicians, and engineers, and claims were made for cybernetics as a universal superscience capable of accommodating all of the disciplines (Bowker, 1993).

Nonmodern Ontology

The distinctiveness of cybernetics can be expressed in different ways. The most productive and radical, followed here, is in terms of ontology, its vision of what the world is like. The ontology of the modern sciences is that of a world of fixed and specifiable entities in fixed and specifiable relations to one another, and the job of the sciences is to generate knowledge about these entities (quarks, genes, social interests, molecular structures, and dark matter). The ontology of cybernetics is different and in that sense 'nonmodern' (Latour, 1993). Stafford Beer (1959: 18) described cybernetics as the science of 'exceedingly complex systems,' meaning systems we can never fully grasp conceptually and that are always becoming something new. The job of cybernetics is not, therefore, to produce articulated knowledge of specific entities, but rather somehow to conceptualize aspects of the world as built from ultimately unknowable elements, and to explore ways of acting accordingly. Three characteristic features stand out.

1. The cybernetic vision centers on agency and performance – in the sense of worldly actions – rather than on intentions and knowledge. The world is a place of action and reaction among a multiplicity of elements.
2. Agency is emergent in a brutal sense: we cannot know in advance how any entity will act when placed in a novel situation.
3. The analysis is decentered: in the play of performative action and interaction none of the elements acts as a still, controlling (and explanatory) center. Everything is at stake and liable to transformation in 'dances of agency' (Pickering, 1995). As far as the social sciences are concerned, this speaks of a 'posthumanist' decentering of the analysis, an acknowledgment that we ourselves are transformed and become something new in our traffic with people and things.

Performance, emergence, and decentering of the human: these topics are central to cybernetics but marginalized at best in modern thought. We can therefore see cybernetics as instantiating a nonmodern paradigm, in Thomas Kuhn's sense, radically disjoint from the Enlightenment disciplines. This, in turn, explains the resurgence of cybernetics in the new millennium, as indexing a growing conviction that we need to explore the world from new angles. We can now examine some of the important threads of the cybernetic paradigm.

Science and Technology Studies

Though its debts to cybernetics are obscure and sometimes amount to a rediscovery of cybernetic insights, the posthumanist wing of science and technology studies (STS) has worked out a cybernetic analysis close to the heartland of the traditional social sciences. The actor-network theory approach associated with the work of Bruno Latour, Michel Callon, and John Law (Latour, 1987, 2005); Donna Haraway's (1991, 2008) nonessentialist 'cyborg' reconceptualization of the unit of analysis and her parallel analysis of relations between

humans and animals; Katherine Hayles' (1999) discussion of embodiment and disembodiment; and Andrew Pickering's analysis of the history of science as a 'mangle of practice' (Pickering, 1995; Pickering and Guzik, 2008) all share a cybernetic vision of the world as a place of decentered and emergent performative becomings. Posthumanist STS grew out of detailed studies of laboratory practice to encompass, for example, macrotransformations of science, technology, and society in the nineteenth and twentieth centuries, and has articulated principled arguments against the presuppositions of traditional social theory (Pickering, 2010b).

Work in STS has increasingly resonated across the social sciences and humanities, informing important developments in sociology, anthropology, geography, politics, literary studies, and studies of management and organizations. Philosophical inspiration has been sought from pragmatism, especially the writings of William James, from continental philosophy, including Henri Bergson, Alfred North Whitehead, Martin Heidegger, and Gilles Deleuze, and even from premodern traditions, such as Taoism, which likewise envision the world as a place of endless decentered flows and becomings (Pickering, 2013). In contemporary philosophy, much the same ontology is elaborated in works often referred to as the 'new vitalism' and 'speculative realism,' such as those of Karen Barad, Manuel DeLanda, Graham Harman, Brian Massumi, and Isabelle Stengers.

The Brain

The original referent of cybernetics was the brain, but the brain understood as primarily a performative rather than cognitive organ (Pickering, 2010a). While postwar research in artificial intelligence (AI) sought to emulate conscious reasoning processes, cybernetics instead understood the brain as embedded in worldly actions and in preconscious processes of performative adaptation to the unknown (for example, homeostatic processes such as maintaining blood temperature constant in differing environments). While AI had centered on computer programming, cybernetic brain research typically consisted in building adaptive electromechanical systems. Gray Walter's (1953) robot 'tortoises' located and pursued light sources while negotiating obstacles encountered en route. Ross Ashby's (1952) homeostats engaged in transformative dances of agency with one another, randomly reconfiguring their inner circuitry until they achieved collective states of dynamic equilibrium. In the 1980s, tortoise-style robotics was reinvigorated by Rodney Brooks (1999), and this approach to situated robotics is now a major line of research alongside work centered on AI techniques.

Inspired by psychiatric concerns with epilepsy and madness, early cyberneticians were interested in the pathological as well as the normal brain. Walter drove his tortoises mad by contradictory conditioning and then cured them in electromechanical ways, which he argued shed light on the efficacy of sleep therapy, electroshock, and lobotomy, the great and desperate cures of 1950s psychiatry. Gregory Bateson derived a very different approach to madness from Ashby's homeostats. His concept of the double bind as precipitating schizophrenia was one of family members locked into pathological cycles of contradictory communication much like a combination of homeostats unsuccessfully hunting for equilibrium. And he understood the interplay of sufferer and psychiatrist as a symmetric and open-ended process of reciprocal adaptation (Bateson et al., 1956). This view was put into practice by R.D. Laing and colleagues at Kingsley Hall in London in the second half of the 1960s. Kingsley Hall was a centerpiece of the antipsychiatry movement, a commune in which the sane and the mad lived together in nonhierarchical relationships, with the object of sustaining sufferers through their 'inner voyages' and, at the same time, helping the sane to become new sorts of selves (Pickering, 2010a).

At the opposite extreme from madness, the early cyberneticians were interested in altered states and ecstasy. Walter (1953) included within his overall cybernetic framework states such as dreams, visions, telepathy, the achievement of nirvana, and the uncanny performances of Eastern yogis, such as suspending the heartbeat and the breath. He also experimented on the brain, using a strobe light to induce symptoms of epilepsy and discovering in the late 1940s that strobes also induce visions of dynamic geometrical patterns. This work on madness and altered states points to a cybernetic image of the self more encompassing than the rational and controlled image assumed and reproduced by AI and the modern social sciences, and in turn leads in the direction of nonmodern and non-Western understandings of consciousness and spirituality, which share with cybernetics a decentered posthumanist ontology. A common fascination with altered states, explorations of consciousness and Eastern philosophy and spirituality also constituted an important axis of intersection between cybernetics and the counterculture of the 1960s.

Ashby and Walter built machines to emulate the adaptive brain. In their biological computing project of the late 1950s and early 1960s, Stafford Beer and Gordon Pask tried instead to use naturally occurring adaptive systems as substitutes for human brains, attempting to find ways to use pond ecosystems, for example, to replace human managers in factories. The nonmodernity of this project is clear: instead of purposeful and protracted design, it rested on a hylozoist conviction that nature is endlessly lively, and that whatever we need can already be found there (Pickering, 2010a).

Management

The biological computing project was part of the cybernetic concern with theorizing and managing organizations. From the later 1960s onward, Beer's work in management consultancy was organized around what he called the viable system model or VSM (Beer, 1981). Instead of incorporating real biological material into the organization, Beer's idea was now to model information flows within the organization on the most adaptive biological system he could think of: the human brain and nervous system. Beer's formal diagram of the VSM represents information pathways between five levels of the organization modeled on their biological equivalents, running between production units at level 1 and the board of directors at level 5 through various intermediary levels and the firm's environment. Much of Beer's attention focused on level 3, which housed a set of operations research models of the organization,

and level 4, home for a big computer model of the firm's world, the wider economy. These models illustrate the place of articulated knowledge in the overall cybernetic picture. Beer intended them to be continually revised in relation to the organization's performance, and thus as geared into practice and performance, rather than controlling performance as in the modern cognitivist picture.

On the model of Ashby's homeostats, Beer insisted that internal relations between levels within the organization should themselves take the form of a performative dance of agency. The relation between levels was supposed to be a process of 'reciprocal vetoing,' of proposal and counterproposal, until some sort of equilibrium emerged that all of the parties could live with. This constructive give and take contrasts strikingly with the hierarchical command-and-control structures typical of modern management. The VSM has many followers in management today (Espejo and Harnden, 1989). Its most ambitious application was to the entire Chilean economy under the socialist regime of Salvador Allende in the early 1970s. Project Cybersyn, as it was called, went a long way in a couple of years before it was cut off by the Pinochet coup (Beer, 1981; Medina, 2011).

Beer also developed a structured approach to decentered decision making that he called Syntegration. Syntegration is a complex process with many iterations, usually extended over several days, but the basic idea is to assign participants to the edges of a notional icosahedron, and to organize a series of sequential discussions between the parties whose edges end at a common vertex, alternating in steps between the vertices at the end of each edge. In this way, arguments can progressively echo all around the icosahedron, eventually taking an emergent form controlled by no one in particular. Syntegrations have been performed on many topics, running from the reorganization of the British Operations Research (OR) Society (of which Beer was President) up to Israeli–Palestinian relations and world peace, and they continue to be held today (Beer, 1994).

The Environment

In the later years of his life, Gregory Bateson turned his attention to the environment. Further articulating the concerns of the nascent environmental movement, in the late 1960s he developed a cybernetic understanding of our relations with nature (Bateson, 1968). He argued that we should understand nature as itself lively and emergent, as always liable to surprise us, and that attempts to manage and reconfigure the environment should thus be expected to elicit unexpected and possibly catastrophic responses – as in the disastrous effects of pesticides on wildlife described in Rachel Carson's *Silent Spring*. Bateson argued that we need new ways of imagining nature as beyond any linear forms of control. The deep ecology movement, James Lovelock's Gaia hypothesis and work in complexity theory on environmental resilience and tipping points have continued this reimagination up to the present (Lenton et al., 2008). All of these point to an ontological decentering of the place of humanity in nature and evoke echoes of premodern ontologies, especially Taoism (Jullien, 1999). Adaptive approaches to environmental management attempt to put such posthumanist imaginings into practice, exploring nature's tendencies through performative experimentation 'in the wild' – staging artificial floods on rivers, for example, to learn more about how to manage ecosystems (rather than trying to calculate their behavior in advance) – or recognizing, in a hylozoist fashion, that nature is better at absorbing the shocks of flooding than engineers are at containing them, as in the Room for the River project in Holland (Gunderson and Light, 2006; de Groot and Lenders, 2006; Asplen, 2008; Pickering, 2013).

Art

Artists are in the lead in the current cybernetic resurgence, often exploring lines of work opened up in the 1960s (Gere, 2002; Salter, 2010). Grey Walter's tortoises have spawned endless variations and elaborations in robotic artwork. Made for the 1968 *Cybernetic Serendipity* exhibition in London, Gordon Pask's *Colloquy of Mobiles* was an array of five adaptive robots, three designated male and two female, that sought to satisfy each other's desires with light beams, rotating in space and communicating by sounds in pursuit of equilibrium and temporary quiescence. The *Colloquy* was an artistic variant of a long line of adaptive teaching and learning machines built by Pask and his colleagues, beginning with a machine called Musicolour in the early 1950s (Pickering, 2010a). Musicolour turned a musical performance into a light show, but the connection between sound and light was cognitively opaque to the musician. The machine adapted to each performance as it went along; thresholds for activating lights increased, and the machine would eventually 'get bored' and cease to respond to repeated tropes, thus encouraging the performer to adapt to the machine by trying something new. In effect, each Musicolour performance was a decentered and emergent dance of agency between the musician and the machine. The *Colloquy* in its turn was a dance of agency between purely nonhuman participants. Pask elaborated an aesthetic theory around these machines, arguing that we enjoy and derive satisfaction from the process of coming to terms with inscrutable systems, as long as it is possible to achieve some relationship in a finite time (Pask, 1971). Simon Penny's *Petit Mal*, first shown in the early 1990s, is a mobile robot that tracks the motion of humans around it and, again, lures them into open-ended dances of agency (Penny, 2000). Ruairi Glynn's (2008) work, *Performative Ecologies*, updates Pask's *Colloquy* by adding learning algorithms to robots that dance with both human spectators and each other (Glynn, 2008). The *Pask Present* exhibition in Vienna in 2008 brought together a whole range of Pask-inspired artworks (Glanville and Müller, 2008).

On a different line of descent, Walter's explorations of stroboscopic flicker effects crossed over into the art world in the 1960s via the Beats. William Burroughs was a perceptive reader of Walter's *Living Brain*, as is clear from a reading of *Naked Lunch*; Brion Gysin learned of flicker from him and went on to build flicker machines as artworks and putative replacements for TVs in the home (Geiger, 2003). The early years of the twenty-first century have seen a proliferation of flicker artworks, often conjoined with powerful low-frequency sounds, as both material entities and film effects (for example, Matthijs

Munnik's massive 2013 installation *Citadels: Common Structures* (Vimeo, 2013)). One can think of flicker art as a technology of the nonmodern self (Foucault, 1988), continuing Walter's explorations of the performative brain. Works like Chris Salter's *JND* also fall into this category, though operating on different sensory modalities, combining tactile stimulation on the margins of perception in a work that adapts to the responses of participants (another dance of agency) (Salter, 2012).

Another strand of contemporary cybernetic art thematizes the performative agency of nature, matter, and complex systems. Chris Welsby's work in experimental cinema and video since the late 1960s aims in various ways to hand over control in film making to the elements: sun, wind, weather, and the motion of the planet in space. His 1974 movie *Seven Days* is a time-lapse film of a Welsh landscape over a period of a week in which the camera both tracks the sun and oscillates between pointing at the land when the sun is out and at the sky when the sun is obscured by clouds (Welsby, 2011). In Richard Brown's work, *The Electrochemical Glass*, three electrodes of copper, aluminum, and iron were sandwiched in a conducting fluid between two glass plates and the assemblage evolved unpredictably over time into a continuously changing work of art as material was deposited between them. This work again confronts us with the emergent liveliness of nature. Invoking another premodern ontology, Brown (2003: 20) described this work "as a daily reflection of process, decay, transmutation and growth; the slow changes resonating with memory and notions of self – a form of contemplative alchemy."

Various forms of bioart directly thematize the emergent agency of biological systems, including the high-tech and very scientific work of the SymbioticA laboratory in Australia, which aims literally to grow sculptures from living cells (Catts and Zurr, 2002) and, at the everyday level, the ancient East Asian art of bonsai (both of which entail dances of agency between the artist and a living substrate). Ursula Damm's (2010) installation *Greenhouse Converter* (for online video, see Damm, 2014) exemplifies the liveliness of coupled material and biological systems. The state of a mini ecology of algae and water fleas acts to reveal or obscure an array of light-emitting diodes (which spell out the word 'beloved,' a reference to Lynn Margulis' theory of endosymbioisis). The lights change frequency to maintain a dynamic balance of fleas and algae (and spectators can interfere with the system but not control it, by changing the gas composition of the water that flows through it). At the human end of the spectrum, Stelarc's works – beginning with performances in which he was suspended in the air via hooks through his flesh, and running through robotic and surgical augmentations of his limbs and sensory systems – all thematize the performative rather than cognitive aspects of our being and coupling into the world (Stelarc, 2007).

Developments in architecture have paralleled those in art. In the 1960s, Cedric Price, as well as the British architectural collective Archigram, imagined buildings and cities that could change and adapt in response to emergent developments in their use and environment (rather than being designed to meet preconceived needs) (Sadler, 2005; Mathews, 2007). Gordon Pask's first involvement with architecture came in the early 1960s as head of the cybernetics committee involved in planning a public building in London called the Fun Palace. Pask's aim was to design a control system for the building, which would enable it not only to adapt to emergent patterns of use, but also sometimes to get bored along the lines of Musicolour, reconfiguring itself in unpredictable ways and thus inviting its human inhabitants to find novel uses and practices (Mathews, 2007). John Frazer (1995) elaborated on Pask's approach to articulate an evolutionary vision of architecture, in which built structures evolve in relation to their inner and outer environments. Today, adaptive and generative approaches are leading themes in architectural research.

Collectively, these works (and many more) function as ontological theater. They stage aspects of the cybernetic ontology of performative and emergent interactions among humans and nonhumans, and in doing so help us to grasp the cybernetic vision by translating it into nonverbal and performative forms. If orreries can function as icons of the modern ontology of a regular and machinelike cosmos, interactive robots, flicker machines, and movies controlled by the weather are mnemonics for a cybernetic world of endless and unpredictable flows and becomings. Returning to an earlier heading, we can understand these artworks as microenvironments that might, in turn, help to refamiliarize us along Batesonian lines with nature at large and the macroenvironment, and to suggest new approaches to engaging with the latter.

Politics

From its beginning, cybernetics has been politically controversial. On the one hand, it has been seen as a profoundly threatening science of technocratic control and manipulation. The subtitle of Wiener's *Cybernetics* already defined it to be the science of "control and communication in the animal and the machine," and in 1950 in *The Human Use of Human Beings* Wiener himself warned of the dangers of cybernetic automation. Bernard Wolfe's science fiction novel *Limbo* (1952) sketched a horrific picture of a cybernetic world of brain surgery, amputations, and prosthetics. The most extended recent critique is from the Tiqqun group, arguing that "Cybernetics is the police-like thinking of the Empire, entirely animated by an offensive concept of politics … Cybernetics is war against all that lives and all that is lasting" (Tiqqun, n.d.: 8). Against that view, Haraway (1991) opted for the figure of the cyborg, the cybernetic organism, as an icon for her version of a nonessentialist and emergent radical socialist-feminist project, and Pickering (2010a) likewise argues that the history of cybernetics offers us a set of 'sketches of another future,' a future radically different from and preferable to contemporary neoliberalism.

One can understand these divergent political evaluations as referring to different threads in the history of cybernetics and the specific material exemplars from which they grew: the thermostat and the homeostat, respectively. The negative evaluation focuses on cybernetics as a branch of control engineering. Deriving from his work in World War II, Wiener's vision of cybernetics grew out of his wartime work on servomechanisms, simple feedback devices like the domestic thermostat (Galison, 1994). The thermostat seeks to minimize deviations in some specified variable, such as the temperature

in a room. If the temperature exceeds a preset value, the thermostat turns the heating off, and then back on when the temperature falls. The political question is, what would this version of cybernetics look like if played out as a blueprint for a social world? The critical argument is that it would be a disaster, a horror show. In particular, it is easy to see how discussions of the thermostat resonate with visions of overarching social control, with thermostatlike technosocial mechanisms sitting on top of and optimizing the performance of existing organs of control: the police, the army, etc. One thinks of Gilles Deleuze's remarks on 'control society.' And the picture becomes more sinister when one observes that what escape this sort of cybernetic analysis are precisely the goals and purposes of feedback systems. The thermostat's target temperature is something given from outside the system, a number programmed by the user. No great analogical leap is required to get from there to a society governed by a small group of politicians, bankers, and media men setting the operating parameters of society for their own benefit.

But other strands of cybernetics conjure up a quite different political vision. Thermostats are hardwired to maintain control of some variable, but, as discussed above, Ashby's homeostats explored their environments performatively and responded to whatever came back to them, reconfiguring themselves internally until some state of equilibrium was found. And as a blueprint for social organization and action, the homeostat suggests not Tiqqun's vision of a control society, but something very different: a society evolving through transformative open-ended experimentation. One can think here of the contrast between traditional management theory and practice as hierarchical control and Beer's VSM approach, with its symmetric homeostatic linkages between levels of organization; or between traditional authoritarian psychiatry, in which doctors are the only legitimate agents, and the symmetric communal relations of antipsychiatry; or between our usual command-and-control relationship with the environment and the adaptive cybernetic approaches mentioned above.

Philosophically, these political contrasts map onto Martin Heidegger's (1977) distinctions between 'enframing' and 'poiesis' as different modes of being in the world. Enframing is the defining stance of modernity, and grasps the world, human as well as nonhuman, as 'standing reserve' to be put to work in preconceived projects. Poiesis, instead, is a stance of experimental openness to whatever the world emergently has to offer us – finding out, in place of domination. Heidegger looked back to the arts in ancient Greece for examples of poiesis. The positive political evaluation is that the homeostat-inspired wing of cybernetics offers us examples in the present from which to develop ways of thinking and acting radically different from the society of control (Pickering, 2010a).

Cyclical Industrial Dynamics

Hao Tan, University of Newcastle, Callaghan, NSW, Australia

© 2015 Elsevier Ltd. All rights reserved.

Abstract

In many industries, market dynamics such as sales, price, capacity, and investment are highly cyclical, observed in the form of successive expansions and contractions that affect all firms. These industry-level cycles may have different patterns from the general business cycles at the country level; and they are also distinct from fluctuations due to seasonal effects and those due to random shocks in the industry. The generation of industry cycles is considered from the Schumpeterian perspective to be endogenous, while from the neoclassical perspective they are created by exogenous shocks. Different mechanisms may be seen to account for them, depending on the industry, ranging from effects of macro-business cycles, to mismatch and delay between different market dynamics, and to dynamics of innovations, among others. These cyclical industrial dynamics have profound implications for firms' strategizing.

Many industries have long been characterized by strong cyclicality in their market dynamics, covering such attributes as demand, revenues, prices, profits, and capacity. Those cyclical industrial dynamics, variously termed in different contexts as boom and bust cycles, commodity cycles, durable goods cycles, or simply industry cycles, are of great interest to both economic theoreticians and practitioners. Firms are keen to understand causes of the cyclical dynamics and predict their movements in order to 'stay ahead of the curve.' A better understanding of those cyclical industrial dynamics is also important to the field of social and behavioral sciences. After all, the cyclical dynamics at the industry level arise as a result of behaviors of individual players of the industry; and together the cyclical behaviors of many industries, through superposition, comprise cycles at the macroeconomic level that are of social and industrial significance.

Research into cyclical industrial dynamics, however, has been overshadowed by research concerning two well-known phenomena, namely, business cycles or economic cycles at the country level, and industry life cycles. First, research on business cycles focuses on the general cycles in the aggregate economy. Those general business cycles that are defined by macroeconomic quantities such as GDP and total employment, however, do not usually recognize different cyclical patterns and behaviors existing at the industry level. Moving against the general business cycles, some industries are procyclical (e.g., most of the manufacturing industries), some are acyclical (e.g., the pharmaceutical, education service, and public service industries), and some are even countercyclical (e.g., the health service industry). Many industry-specific factors contribute to the rise of cycles. For high-technology industries, their cycles are affected by the uneven pace of technological changes. For the agriculture sector, the cycles are affected by weather conditions such as droughts and floods. Other sectors such as utilities in many countries are affected by election cycles because of the latter can bring changes to the policy and regulatory environment. Industries also differ in such aspects as nature of technologies and products, industry structure, stage of development, and competition dynamics, which all inevitably affect the emergence and persistence of their own cycles. As a result, the timing, duration, and amplitude of industry-specific cycles may vary widely. Nevertheless, their significance is fundamental.

Second, the term 'industry cycles' is sometimes confused with 'industry life cycles.' The latter, however, is mainly concerned with the long-term evolution during the lifetime of a technology, which typically goes through a sequence of stages such as the exploratory stage, the growth stage, and the mature stage (Klepper, 1997).

This article focuses on cyclical industrial dynamics and provides an overview of the research on the meso-level, medium-term phenomenon. Those cycles, while differing in patterns and mechanisms across industries, are characterized in terms of successive expansions and contractions of sales, prices, capacity, and investment in a given industry, and, in most cases, as recurrent deviations from the long-term trends of the market dynamics in the industry. The research of cyclical industrial dynamics has been concerned with three main questions: What are they? Why do they happen? How can they be utilized by firms themselves as well as by policy makers?

Identification and Measurement

Analysis of cyclical industrial dynamics must start with identification and measurement, especially recognition of the cyclical pattern of industrial activities from other patterns displayed in industrial data series, such as long-term trends, fluctuations due to seasonal effects, and those due to random shocks. In contrast to seasonal fluctuations, cyclical patterns of an industry are not of a fixed period and normally have longer duration (more than a few months) in their phases. Nevertheless, they are more regular than random fluctuation.

One approach to identify and measure cycles in industrial activities is based on the decomposition method. Assuming an industrial time series is underpinned by four basic components, each presenting different driving factors, the data series can be 'detrended,' 'seasonally adjusted,' and 'deflated,' in order to remove the trend, seasonal, and random component parts to derive the cyclical pattern. Figure 1 shows an example of the use of such a method to bring out the cyclical pattern of global semiconductor sales. In particular, the deflated data series is subject to a Hodrick–Prescott (H–P) filter that separates the trend and cycle components.

Similar to the practices of dating business cycles by the National Bureau of Economic Research in the United States or

the Central Statistics Office in the United Kingdom, final turning points of cycles at the industry level can then be determined using preset dating rules or the so-called nonparametric dating algorithm. One such algorithm, as formulated by Bry and Boschan (1971) for dating business cycles, states that a peak (trough) occurs at time t whenever $\{yt > (<)yt \pm k\}$, $k = 1, \ldots, K$, where K is set to five (see Harding and Pagan, 2002). In other words, major peaks and troughs can be identified only if there are no other observations with larger (smaller) values within five periods of time prior to or following the point of concern. Applying modified rules to the cyclical pattern derived from the global semiconductor shipment data, Figure 2 shows the cycles of the industry along with their turning points.

Another approach to identifying and measuring industry cycles heavily relies on econometric models that fit historical data series and describe cycles based on estimated parameters. Models can be based on analysis of a time series in the time domain or in the frequency domain. A widely employed class of models analyzing time series in the time domain involve the so-called autoregressive integrated moving average (ARIMA) method. The method specifies a model by three main parameters representing respectively the possible autocorrelation pattern of the data series, the amount of differencing to make the series stationary, and the order of the moving average. Recently, efforts have been made to employ variants of the ARIMA method such as the Markov regime-switching model to study industry cycles (Liu and Chyi, 2006). However, those models usually do not generate turning points of cycles but are to forecast the future movement of market dynamics. Nor do those models intend to estimate properties of the cycles such as duration and amplitude.

Industrial data series can also be analyzed in the frequency domain, in which most powerful cycles, if any, can be detected. Figure 3 illustrates such an analysis. The analysis transforms the industrial data in the time domain into the frequency domain and generates a frequency spectrum through a Fourier transform (Tan and Mathews, 2010a). The three peaks in the frequency spectrum represent not just one but three pronounced cyclical components underpinning the industrial data, with frequencies of 0.25, 0.44, and 0.97 cycles per year. In other words, the industrial dynamics appear to be driven by at least three types of cycles with average periods of 4, 2.29, and 1.03 years. In this case, it seems that the three cyclical components may correspond to different cyclical effects, such as general business cycles, industry-specific factors, and seasonal effects. Based on a composition of the detected cyclical components, the industrial data series can be modeled and its cyclical dynamics can be more closely analyzed, as shown in Figure 4.

Explanations

In searching the drivers of cyclical industrial dynamics, researchers naturally look into existing theories for business cycles. Early theorists tended to attribute the business cycles to exogenous factors such as the periodicity of sunspots or movement of the planet Venus. Later economists, including Adam Smith, believed that business cycles arose as a result of the self-correcting mechanism of the economy. Contemporary work explains business cycles in terms of the role of governments in executing problematic monetary policies, or random technology shocks as proposed by the Real Business Cycle

theory. By contrast, the school of thought that sees cycles as being endogenously generated takes inspiration from Joseph A. Schumpeter, who distinguished four types of business cycles and attributed them to different mechanisms, ranging from excessive inventory by firms (for the 3–5 year Kitchin cycle), to lags in fixed investment spending (for the 7–11 year Juglar cycle), fluctuations in infrastructure investments (for the 15–25 year Kuznets cycle), and some long-term factors affecting the human society (for the 45–60 year Kondratieff cycle) (Schumpeter, 1939). These are all endogenous mechanisms.

Whereas the majority of contemporary business cycle theories are based on studies of behaviors of industries and firms and indeed are inspiring for industry cycle research, explanations of cyclical industrial dynamics will need to be from a different perspective. As the focus is on individual industries, which are subsystems of a macroeconomy, the general macroeconomic conditions now act as an 'exogenous factor'; and the effects of such factors as monetary policy become indirect through the change of demand of end users. Most individual industries are affected by wider business cycles, but heterogeneity across industries cannot be ignored. Therefore, it seems that more specific explanations are needed for the cyclical dynamics of given industries.

For manufacturing industries, especially those producing durable goods, a profound mechanism in driving the cycles is associated with the time lag of capacity building in response

to demand from downstream industries. From a system dynamics perspective, a substantial time delay in feedback loops consisting of processes of information collection, decision making, and action is largely responsible for industry cycles; and the swings tend to amplify when moving up along the supply chain from downstream to upstream industries (Sterman, 2000). For example, based on an analysis of the feedback structure of the commercial jet aircraft industry involving time lags between travel demand, order backlog, airline capacity, fares, and manufacturer production capacity, Lyneis (2000) established a system dynamics model to forecast the cycles in orders for aircraft, and found that the model describes historical cycles well.

For industries featuring strong competition, some argue that gamelike competitive behaviors of firms may cause cycles of the industries (Dearden et al., 1999). Firms may simultaneously engage in capacity addition or deletion activities, for reasons such as strategic preemption or 'herd' behavior; thus the industry as a whole is likely to end up with excess or insufficient capacity. The succeeding overcapacity or undercapacity behaviors lead to cycles in other market dynamics such as price and sales.

For high-technology industries, sales and price cycles are strongly influenced by technological changes in the industry. It is well-known that technological changes usually occur at an uneven pace, with radical and slow innovations being introduced alternately, a notion that goes back to Schumpeter (1939). In particular, Anderson and Tushman (1990) argue that sales of the industry tend to peak after a 'dominant design' has emerged because uncertainties associated with competing design paths are diminished. An examination of the cyclical dynamics in sales of the global semiconductor industry against the introductions of generations of integrated circuit technology seems to support the argument (Tan and Mathews, 2010a).

In sum, there seem to be multiple mechanisms that trigger and sustain cyclical industrial dynamics. Some drivers of industry cycles may be specific to a given industry. In addition, cycles of sales, price, capacity, and investment of an industry interact with each other and result in lead–lag relationships of the cycles (Tan, 2011).

Implications

In some industries, cyclical industrial dynamics constitute a fundamental dimension of the environment of firms. In particular, the significance of industry-specific cycles to the long-term development of industries lies in the idea of cleansing mechanisms as discovered by Joseph Schumpeter (1939). During industry cycle downturns, resources are released from firms and technologies with poorer performance, and reallocated to those that are more effective and promise to succeed in the market, thus enhancing the overall productivity and competitiveness of the industry. In line with this notion, the recent opportunity hypothesis argues for the positive effects of recessions for economic growth because productivity-improving activities are more likely to occur during the period thanks to the lower opportunity costs (Aghion and Saint-Paul, 1998).

From the perspective of individual firms, cyclical industrial dynamics bring rare opportunities for those that can strategize accordingly. For example, in some industries featuring very high barriers such as the global flat-panel display industry, challengers have been able to enter the industry only during industry cycle downturns because only at those times do expertise and technologies become available (Mathews, 2005). Established players can also benefit from industry cycles. Some recent examples of firms that utilize industry cycles to gain competitive advantages include Nokia (see Carral and Kajanto, 2008) and Intel (see Tan and Mathews, 2010b) in their respective industries. Thanks to their proactive investment and strategic positioning during the industry cycle downturns in the 1990s and 2000s, both came out from the industry downturns in much better shape than their competitors.

Dahl, Robert A (1915–2014)

Charles HG Crothers, School of Social Sciences and Public Policy, AUT University, Auckland, New Zealand

© 2015 Elsevier Ltd. All rights reserved.

Abstract

Robert Dahl (1915–2014) was a prominent political scientist whose academic career was based at Yale University and his studies focused on democracy from the theoretical, empirical, and normative perspectives. He also examined power (or influence) as a central concept and was a leader in the application of behavioral approaches to the study of politics. Although most of his work focused on the USA, he also launched comparative studies of European democracies particularly examining size effects and the role of oppositions. His later work was increasingly concerned with the effects of increasing socioeconomic inequalities on the quality of democracies.

Robert Alan Dahl (1915–2014) was a major theorist and researcher into democracy, who played a prominent role in American and World Political Studies throughout the second half of the twentieth century. Besides the usual book reviews and commentary throughout the relevant literature, Dahl's oeuvre has been complemented by a festschrift (Shapiro and Reeher, 1988) and two volumes of collected works (with bridging section introductions: Dahl, 1997a) and he has written or had recorded several autobiographical accounts (e.g. Dahl, 1997b, 2007).

Personal

Robert Dahl was born in 1915 in the small town of Inwood, Iowa to a family of Norwegian background (who in turn had come from North Dakota) and grew up in the even smaller Alaskan township of Skagway. His paternal grandfather was a farmer holding populist views and with a passionate interest in politics. His father was a medical doctor. His mother was of English-Scottish descent and quietly religious and more politically conservative. His family, which included brothers, was intellectual and engaged with public affairs – his parents are described as 'readers.' Although in his earlier years, the family was often very poor through its reliance on the wildly fluctuating incomes of his father's farming clientele, food (in lieu of money fees) was more plentiful. Within this family context, Dahl always felt he was destined for university education and he developed an interest in a career in politics or public administration.

This small town and remote background affected aspects of Dahl's subsequent work. From the age of 12, he worked on local docks and railroads which set him up for experiencing, and appreciating, the folk wisdom and hard working conditions of ordinary working people, leading to his later cautious advocacy of worker ownership and control. He also acquired a love of mountains and sea and an awareness of racial discrimination in relation to the local Tlingit tribe; despite some everyday links with young tribes-members he never wholly broke through caste barriers. His Norwegian descent also helped lead to the inclusion of small European democracies in his studies and attention to the problem of the effect of scale in the operation of polities.

In line with usual local experience he traveled to the University of Washington (BA in 1936) in Seattle to study. Although this was the closest major university, it still required a horrendous (5-day trip) journey. There, Dahl studied political science and economics as part of a broadly legal education. Once graduated, he applied for postgraduate fellowships, gaining one to Yale (PhD in 1940) – which again required long (but interesting) travel by rail.

Yale University then had a 'Government' department (later renamed 'Political Science' somewhat to Dahl's regret). It was then not as distinguished as Columbia, Harvard, Michigan, or Chicago. But the tiny department had some good staff and Dahl's studies were supplemented by courses in law school on business law and regulation. Political science as it was then conducted involved institutional description and analysis with an emphasis on constitutions, political parties, judiciaries, and executives. Its geographical focus was narrowly Eurocentric. These were all aspects of political science scholarship which Dahl helped to progressively open up during his career. Dahl's dissertation was on socialist programs and their limitations; as with many others of his generation, he had become caught up with the high aspirational horizons of the New Deal. As was usual then, his was a library dissertation. In between coursework and dissertation, he took up an internship in Washington DC. There he met his wife and also worked closely with more cosmopolitan East Coast Jewish socialists, joining the US socialist party.

Dahl later reported that, apart from immediate teachers, his main influences (because he had to struggle with their work) were the giants of past political science such as Plato, Rousseau, Marx, and Schumpeter. Schumpeter's famous 1942 book (*Capitalism, Socialism and Democracy*) provided a major challenge to study democracy in action, e.g., exploring how competition among elites offset the power of each. His views were contrary to those of famous Italian elite theorists Mosca and Pareto but were more in line with those of legal pluralist Leon Duguit and the earlier writings of Harold Laski. The latter were pluralists in their approach, emphasizing that power tended to be spread among elite groups rather than totally concentrated.

Having finished his dissertation, Dahl again returned to Washington DC to work on economic planning agencies. He found that the National Labor Relations Board was an embattled organization. Dahl carried out field investigations but found the response of some employers menacing. After this assignment, he worked in the Department of Agriculture with the role of making the bureaucracy more efficient. Then came a spell in the Office of Civilian Supply, the Office of Price Administration, and the War Production Board doing economic research. These tended to be very routine tasks. Still, his involvement in bureaucracy allowed valuable learning concerning the possibilities and limitations of central economic planning in a democratic system. Another shift was to be gradually converted out of his (still newly found) more idealistic socialism.

Although having a wife and two children, Dahl volunteered for a spell in the US army and served in the European sector for 3 years. He was the leader of a small reconnaissance platoon in an infantry regiment (44th Infantry Div; 71st infantry). This unit carried out night patrols and he earned the Bronze Star with oak cluster for this dangerous work. It was because he had a PhD that he was assigned to military intelligence and this scouting role. His unit fought in the Vogues mountains and after the cessation of hostilities, he was assigned to Paris and then to Frankfurt to de-Nazify German banking system. He did not think he succeeded! Dahl felt that the impact of the war was to increase his feelings of solidarity with working people and also to ignite a passion for the virtues of democracy as opposed to other political systems. It also deepened his thinking on what he wanted out of life: and he now definitely decided he was interested in scholarship rather than a political or administrative career.

On demobilization, Dahl returned to Yale University where the Department of Political Science began to be built up after a period of decline by its chair Jim Fesler. Dahl had sought out his earlier mentors at Yale and was offered a temporary teaching post to teach 'American government' which then became permanent. Indeed, the appointment lasted his whole career – becoming Sterling professor of political science and senior research scientist in sociology and emeritus on his retirement in 1986. The expansion and upgrading of the quality of the department was further pursued by Dahl who was departmental chair from 1957 to 1962. The Yale Department acquired a highly impressive grouping of political scientists including Robert Lane, Karl Deutsch, Nelson Polsby, and Harold Lasswell and was regarded as the top department when ratings began. However, Dahl regarded administrative service as a chore and his continuance at Yale was predicated on not having to take up the chair again. Although such a very long association with a single department might be unusual, Dahl felt his had been a good career choice.

He served as President of the New England Political Science Association in 1951 and of the American Political Science Association in 1966–67. He became a Fellow of the American Academy of Arts and Sciences (AAAS) in 1960, the National Academy of Sciences (NAS) in 1972, and the American Philosophical Society and spent a year at the Center for Advanced Study in the Behavioral Sciences at Stanford University in Palo Alto in 1955/56 and again in 1967. Dahl has received many honorary doctorates and has won many prizes for his work including the Woodrow Wilson Foundation Award (1962) for *Who Governs?* and the James Madison and the Benjamin Evans Lippincott Award (of AMSA) for his *Preface to Democratic Theory*. He was a Guggenheim Fellow twice (1950 and 1978), and the first recipient in 1995 of the Johan Skytte Prize in Political Science, an award given by Uppsala University in Sweden to the scholar who has made the most valuable contribution to political science. He was also a fellow of the Center for Advanced Study in Behavioral Sciences in 1955–56 and 1967. (More background is available at http://politicalscience.yale.edu/news/robert-dahl-sterling-professor-emeritus-political-science-passes-away#sthash.FFlMU035.dpuf.)

Dahl led a 1968 committee that successfully recommended that Yale become one of the first American universities to establish an undergraduate major in African-American culture. But another committee he headed in 1972 recommended that Yale's 4-year course of study be cut to 3 years and that majors be abolished was not successful.

Professor Dahl's first wife (formerly Mary Bartlett) died in 1970 and his second wife was the former Ann Sale. His family included step-daughters Ms Connor and Jane Thery, daughter, Kirsten Dahl; and sons, Peter (deceased), Eric, and Christopher; and four grandchildren.

Work

Dahl's lifelong work has contributed to the academic study areas of democratic theory, American politics, and comparative politics. He has focused on the origins, characteristics, and consequences of democracy, examining democracy from normative, theoretical, and empirical angles. He is often seen as part of a 'Pluralist' school of political thought which was particularly prominent in the Yale Department. In addition, Dahl was a leader of the 'Behavioral revolution' which promoted more rigorous methods and scientific study, and was therefore open to quantitative analysis and survey-based field work. He also contributed theoretical exegeses on the definition of power. Along with many social scientists of his generation whose experience was formed by the New Deal and WW2, his broad moral ethos was to value democracy and other modern achievements but to also recognize their limits and to seek and urge constructive reform.

His life work constitutes a very largely coherent ongoing focus on various aspects of democracy and related issues.

Arguably, he moved somewhat leftward in later life, although this normative direction was also present in his earliest years. Some commentators have argued, though, that there have been two stages in his work: segueing from democrat to democratic socialist, although Dahl was uncomfortable with over-simplifying labels. In contrast to earlier work which emphasized more what was right with democracy, his more recent work encompassed attention to not only why democracy is not working well but also involved a search for alternative solutions. His passion for democracy was accompanied by rather more instrumental views on different forms of economic organization.

Dahl's scholarly style was to be problem orientated within a broad framework. He was as much concerned with raising questions and setting a research agenda as in necessarily answering questions, as his use of the term 'preface' in several important books attests. A self-description was as follows: "… [S]ome question with theoretical and empirical relevance and often for moral importance as well would present itself to me. A piece of work might follow, during which I might reshape the initial formulation of the problem or question." And then questions would be taken up and links would emerge to eventually become a political theory. Because his work was problem orientated no particular approach or methods were preferred, although he always made sure that careful work was advanced. Dahl is often praised for his compact, clear succinct writing. He seldom paused to answer criticism because he preferred to be moving on to his next research project. He wrote some two dozen books (almost all published by Yale University Press) and many (around a hundred) articles.

His influence was particularly promulgated from 1963 onward through the publication of his slim text *Modern Political Analysis* which was reworked through six editions, with the sixth edition produced in 2003 (coauthored with Bruce Stinebrickner). Dahl was a central figure in US and world political science over a long period, with citation count measures of his influence placing him among the top very few political scientists.

Dahl was undoubtedly strongly supported in his work by the microcontext of the Yale Department which apart from its acquisition of many of the leading American political scientists of the time was an intellectually supportive setting. He taught at both undergraduate and more often at postgraduate levels and while very supportive of postgraduate students tended to be relaxed and informal in his teaching style. His work in comparative politics was also strongly supported by his embedding with an enduring collegial friendship network with such authorities as Stein Rokkan (Norway), Hans Daalder (Netherlands), and Val Lowin (American historian of France/Belgium).

Themes that had been raised in his Dissertation were often further developed later on in his intellectual career and included key points such as

- statement of explicit criteria for assessing a democratic political system;
- seeing Marxism (including Leninism) as unsatisfactory;
- being charmed by the potential of small-scale associational and cooperative systems (although these were seen as possibly utopian); and
- stressing the central importance of markets and market socialism in relation to democracy.

Two early studies explored domestic constraints on, and opportunities for, policy formation – *Congress and Foreign Policy* in 1950 and *Domestic Control of Atomic Energy* in 1951. These studies required fieldwork, interviewing officials in Washington DC.

Further studies in the 1950s established his reputation. *Politics, Economics and Welfare* (published in 1952) grew out of contact with fellow-author and fellow-Yale academic Charles Lindblom who was teaching labor economics. They endeavored to restore intellectual analyses in the area of political economy which had tended to lapse as new disciplinary boundaries developed in the previous century. This work first advanced analysis of 'polyarchy' (a term retrieved from a more arcane usage) which endeavored to represent the more attainable approximations to ideal democracy which are possible in large-scale nation-states. A Guggenheim fellowship supported the writing of the book which was a 'sleeper,' taking some time for its influence to emerge.

The book identified the seven conditions that characterize polyarchies:

- control over government policies by elected officials;
- frequent election of those officials without coercion;
- (almost) Universal Right to vote for those officials;
- right of free expression on matters relevant to such elections;
- right to seek alternative sources of information; and
- right to form relatively independent associations/organizations (including political parties and interest groups).

Dahl further developed his general concern with the conceptualization of democracy with his specific argument that it involves the conciliation of numerous minorities and constraints on elite power in his *Preface to Democratic Theory* (1956). Dahl focused on procedural aspects of democracy as opposed to substantive outcomes. Two crucial dimensions are contestation and participation. The book emerged out of a seminar he taught and was then developed further through an invited University of Chicago Walgreen lecture before (after further writing) being converted into the book. Procedural democracy has the ideals of:

- effective participation (adequate and equal opportunities for expressing preferences);
- enlightened understanding (adequate and equal opportunities for arriving at preferences on matters);
- final control of the agenda; and
- inclusion (i.e., widespread sharing of political rights).

In the late 1950s, Dahl participated alongside Paul Lazarsfeld and Mason Haire in the Ford Foundation Program in Economic Development and Administration which endeavored to point up research areas related to problems of business and industry (see Dahl et al., 1959).

His period at Palo Alto exposed Dahl to mathematics and statistical work, including game theory, through other fellows also resident there. This led to his cautious adoption (or at least recommendation) of some of these more formal approaches,

which clearly influenced his 'behavioral' approach to political science research.

After this experience, Dahl felt some need to become more empirically grounded and hence launched a field study of New Haven (the host city for Yale University) published in 1961. Dahl's study was cast as an attempted empirical refutation of the famous study by Floyd Hunter (1953: Community Power Structure) which postulated that communities were controlled by a more or less cohesive and all-powerful elite. Hunter argued that an economic elite dominated the political understructure, composed of civic organizations, trade unions, and political parties. Important policies originated first in the elite to its own benefit; then they were transmitted through the understructure for public approval. The power structure in a community, therefore, is like a pyramid with the economic elite on the top, the political understructure in the middle, and ordinary citizens at the bottom. Hunter's methodology concentrated on a self-selected small group of the most powerful local leaders and so was termed the 'reputational approach.' Dahl's methodology, instead, was to study those who were involved in exerting power on an array of explicit political decisions. He also developed a conceptual critique of elite theorists and the debate rolled on for several decades and extended right across the social sciences (drawing in, for example, C. Wright Mills). Dahl was later to admit that his study was insufficiently sensitive to the limits which external structures imposed on local decision makers.

An academic leave in Rome in 1962–63 inspired Dahl to broaden the geographical scope of his work to encompass small democracies and he also investigated the role and impact of oppositions across a variety of democratic and nondemocratic political systems. This work encompassed working with a network of local experts (*Regimes and Oppositions*, 1973; *Political Oppositions in Western Democracies*, 1966). A further study examined the operations and tradeoffs between efficiency and participation between different sizes of jurisdictions, under the guiding idea that there are significant size thresholds which affect how politics works (*Size and Democracy*, 1973). Following the 1968 student rebellions, Dahl published *After the Revolution* (1970).

In the 1980s, Dahl reworked again the aspects of his theoretical work on democracy with three books (1982, 1985, 1989) on gaps between ideals and actual democracy, and the wider challenges of establishing democratic conditions despite increasing economic inequalities. Dahl became increasingly concerned by the problem of the excessive political power of corporate wealth and the interest in and ability of the wealthy in buying political influence: converting some of their economic capita into political capital. *A Preface to Economic Democracy* (published in 1985) addressed the way in which concentrated wealth can impact the liberal democratic system. He also returned to study policy related to nuclear weaponry. *Democracy and Its Critics* (1989) can be seen as the culmination of Dahl's main work in which he summed up the normative arguments for 'procedural democracy,' explored its limitations, and assessed the empirical conditions for the flourishing of polyarchy. He argues that there has been a 'third transformation' of democracy deepening democratic deliberation and extending it, e.g., to other institutions corporations, unions, and to intentional institutions and governing bodies. Also included is the deployment of new technology. In his *A Preface to Economic Democracy*, Dahl endeavored to show how his model of democracy might be extended to other institutions.

Late in his life, Dahl wrote a summary trilogy of three brief books *On Democracy* (1998), *How Democratic Is the American Constitution?* (2002), and *On Political Equality* (2006a) which could be seen as endeavoring to sum up his legacy. Their message is that democracy is precious but fragile. Having long emphasized defenses of democracy, he turns more to criticism in these more recent works. *On Democracy* builds his strong case for democracy with the criticism following in the further two volumes. His book on the US constitution questions its democratic credentials, while the final book shows concern that US democracy has fallen below an acceptable standard, against a horizon of people's rising expectations and their political disenchantment. Issues facing democracies needing attention include 'globalization,' the rapid development of international organizations, and terrorism. A concern is that the American Constitution is too rigid to allow modernization and the necessary improvement to deal with the mounting difficulties.

In *On Democracy*, Dahl makes the case for democracy generally (i.e., cross-nationally) as it produces demonstrable desirable consequences:

- prevents cruel and vicious rule;
- guarantees citizens certain fundamental rights that undemocratic systems cannot grant;
- ensures its citizens a range of personal freedoms;
- enables them to protect their fundamental interests;
- provides them the opportunity to exercise self-determination and to live under laws of their own choosing;
- gives them the opportunity to exercise moral responsibility;
- fosters human development;
- fosters a relatively high degree of political equality;
- discourages war; and
- encourages prosperity.

These beneficial consequences are good for people because democracy provides the conditions for them to be able to live good, decent, and moral lives. Moreover, it is good for providing fairness and efficiency in other organizations and institutions.

In *How Democratic Is the American Constitution?*, Dahl specifically reviews the American democracy's performance. The US is focused on because it is the oldest, biggest, most powerful, and most self-conscious 'model' modern democracy and is also the one which is most respected and often despised. Dahl argues that, unfortunately, the US Constitution is seen as the repository of eternal political truths and instead Americans need to change the way they think about it. It is too old and was written with no experience of anything resembling modern democracy (e.g., with political parties and a modern press). Judged by today's standards of democracy, Dahl finds at least four serious defects:

- the overwhelming power of the office of the president and the way presidents are elected;
- the inequality of representation, in particular in the Senate;

- the role of the Supreme Court which takes it beyond judicial review to 'judicial legislation;' and
- the dictatorship of history in the near to impossibility of changing and modernizing the Constitution and bringing American democracy up to date with changing expectations.

In *Political Equality*, Dahl turns to the limitations on political equality imposed by economic inequality. He notes that despite attempts by some leaderships to excoriate democracy for their country, everywhere people want democracy and will vote or choose it where possibilities open up – even where there are other societal goals (e.g., development or efficient delivery of government services) which are seen as important.

Cognate More General Analyses

Dahl contributed to further political science discussions closely aligned to his focus on 'democracy.' In the mid-1950s, he contributed to conceptual analysis of the central concept of 'power.' He noted that systematic treatments up to that point were rare and incomplete. Nevertheless he was able to draw on important writers including Hobbes, Weber, and Lasswell. His definition at that time was standard: "A has power over B to the extent that he can get B to do something that B would not otherwise do." In later reflections, Dahl indicated he was dismayed at the continued sloppy use of the term and at the poverty of systematic empirical studies on power which were both conceptually and methodologically sophisticated.

His final version (e.g., 2003: 17ff) involves the definition that influence is

> … a relation among human actors such that the wants, desires, preferences, or intentions of one or more actors affect the actor's actions, or predispositions to act, of one or more actors in a direction consistent with – and not contrary to – the wants, preferences, or intentions of the influence-wielders.

Dahl points out that this definition (2003: 17)

> (1) clearly incorporates the idea of influence-as-causation; (2) excludes relationships between human beings and nature, animals and the like; and (3) avoids the concept of interest and the difficulties inherent in it. Moreover, (4) our definition does *not* exclude trivial or, in the general scheme of things, unimportant instances of influence.

… while recognizing that political scientists prefer to be interested in influence in more formally political settings. Finally, it distinguishes between positive and negative influences, excluding the latter.

Dahl indicates that some further conceptual distinctions can facilitate comparisons of the amount of influence of actors:

- distribution (e.g., extent of political inequality);
- gradations (shape of the distribution); and
- scope and domain of influence (issues over which influence might be wielded).

Differences in amount of influence is explained in terms of three key factors which actors differentially have (2003: 34ff):

- resources/endowments (e.g., money, information, food, ability to make credible threats, jobs, friendship, social standing, ability to make and enforce laws, votes);
- skills (variations in efficiency of using resources to influence); and
- motivations (extent to which actors commit to resources politically).

Finally, some seven forms of influence are identified (in part organized as pairs):

- inducement/power (the influencer can offer something or has the power to deprive the influenced);
- force/coercion (removing the influenced choice – or credibly threatening to);
- persuasion/manipulation (correct or incorrect supply of persuasive information); and
- authority (legitimate orders).

From the 1950s, Dahl was a leader of the 'behavioral revolution' in political science – that is, the use of a sociological approach in the empirical investigation of politics as it happens in reality as opposed to descriptions of ideals set by constitutions or similar institutional analyses. This approach sometimes flirted with formal and mathematical models (e.g., rational choice, games models), and indeed one of the major subsequent developments in political science has been 'rational choice' orientated, although Dahl was more cautious as he wished to retain a central role in political science for examining the influences of wider systems and of historical contexts. Nevertheless, the behavioral revolution required clear conceptualization, careful attention to definitions of key terms, consideration of ways of empirical measurement, and the deployment of appropriate data (often quantitative, such as those derived from surveys) which reported on the views and behaviors of (individual and collective) actors.

Personal experiences such as his neighboring relationship with philosopher Carl Hempel and his time at Palo Alto encouraged this approach but institutionally it was particularly driven through the SSRC committee on Political Behavior on which Dahl served.

Conclusions

Dahl's impact was part of a broad pluralist school whose influence became more limited as political conditions changed after the 1970s (after the era of campus unrest, etc.) and as newer more specialized approaches developed. Arguably pluralism morphed into a broad 'political process' model. More formal rational choice models became a central thrust which leached much for the historical and broader societal context out of analyses. But Dahl's influence remains strong.

In Dahl's considerations of how democracy should work, the distribution of power is central. An underlying assumption is that each person's political voice should have the same weight and that each needs to represent themselves rather than be 'represented' by spokespeople or experts. However, energetic full political participation by everyone is not expected and

might exhaust the political system's capacity. In his view, a somewhat self-selected stratum of 'political man' invests considerable resources in order to effect things and to be involved in the array of associational activity central to the operation of politics. Appropriately designed and maintained institutions will provide facilitative environments for good decision making.

To sum up Dahl's work, he argued that

- democracy is better than nondemocracy both in better delivering fairness and efficiency and fundamentally because it is better for the people living within it;
- established democracies, despite being held out as models, are fragile insufficient and delivering less than they should largely because of unnecessary rigidities of their institutions inherited from the past; and
- democracy is severely challenged by recent trends in capitalism, which have undermined its effective operation and which need to be checked in order to improve the quality of democracy.

Characteristically as a scholar committed to advocating change where it seemed needed Dahl's suggested reforms include

- control of political funding with limit and regulate private contributions to political parties and campaigns;
- social reforms to counter the drift toward ever more economic inequality, mainly in the form of antipoverty policies; and
- in general, nearness and smallness in social and political life to fill the space between citizens and representatives and to keep citizenship control intact.

In this way, Dahl's life project, after adding much complexity and additions, largely returned to its roots when his scholarly work began.

Abstract

Ralf Dahrendorf (1929–2009) was a German-British sociologist, who pondered the question of freedom in modern society. He made a remarkable career in academia, first in Germany (Hamburg, Tübingen, and Konstanz), then in England (Director of the London School of Economics and warden of St Antony's College, Oxford University). Lord Dahrendorf served in the House of Lords and made numerous contributions as a journalist and public intellectual. He developed a sociology of conflict, of life chances, and of civil society. He created a particular concept of the public intellectual, the 'Erasmians,' which resisted the temptations of totalitarianism.

Ralf Dahrendorf was a German-British sociologist preoccupied with the problem of liberty: How is freedom in a modern society possible? His approach to this question was both analytical and empirical, as well as political and normative. In this sense, then, Dahrendorf moved between philosophy and the social sciences. His relentless activism reached well beyond the confines of academia. Rather, as an engaged citizen, critical liberal, and public intellectual he pursued a career in politics and journalism alike. The core of his social and political thought consisted of a sociology of conflict, of life chances, and of civil society. His liberal mind welcomed the pluralism of ideas and ideals, of values and norms as the essential infrastructure of modern society. But this pluralism comes along with different and sometimes antagonistic interests and power differentials, which need rules and regulations. Every society has to be understood as an association of power and domination, necessary to mediate conflicts and the clash of interests. Modern society creates a plethora of life chances for its citizens as a fundamental prerequisite for a liberal conduct of life. Analytically speaking, life chances consist of options and ligatures. Options open up chances of and for free choice. Ligatures help to integrate the individual into this liberal, pluralistic, and often antagonistic order of modern society. Beyond market and state, it is the livelihood of a civil society whose citizens are actively engaged in public affairs, which is the backdrop for liberty.

Life and Career

Ralf Dahrendorf was born on 1 May 1929 in Hamburg. His father, Gustav Dahrendorf made an upward political career as a social democrat, which earned him a parliamentary seat in the 'Reichstag' in Berlin during the years of 1932 and 1933. With the advent of the Nazi regime, he lost his seat and was incarcerated as a member of the German Resistance Movement in 1944. The son, too, began his struggle against the regime by distributing critical leaflets and was taken into custody by the Gestapo. In his autobiography, Dahrendorf (2002) described this experience of solitary confinement as a turning point in his life. His thirst for freedom and the return to a decent society after the cruelty of the Nazi regime determined his course of life.

After the War, he studied philosophy and philology in Hamburg, wrote a dissertation on the concept of justice in Marx's thinking, but soon turned to England for the completion of his academic training. As a postgraduate at the London School of Economics (LSE) in 1952–53, he pursued a PhD under the supervision of T.H. Marshall on "Unskilled Labour in British Industry" (1953). He met Karl Popper, who informed his epistemological thinking in favor of 'critical rationalism,' which helped to transcend both hermeneutics and dialectics in the wake of Kant and Max Weber. Back in Germany, he soon completed his 'habilitation' on *Class and Class Conflict in Industrial Society* (1959) in 1957. In the academic year 1957–58, he followed an invitation of the *Center for Advanced Study in the Behavioral Sciences* in Stanford, where he met fellows like the economist Milton Friedman, the sociologist Talcott Parsons, and the historian Fritz Stern. Upon return to Germany, he started his career as a professor of sociology, first in Hamburg, then in Tübingen, and in Konstanz. In the late 1950s and early 1960s, he published a number of influential books: *Homo Sociologicus* (2010 (1958)), *Über den Ursprung der Ungleichheit unter den Menschen* (On the origin of inequality among men, 1974 (1961)), *Conflict and Liberty* (1962), *Bildung ist Bürgerrecht* (Education is a civil right, 1965), *Society and Democracy in Germany* (1979a (1967)), *Essays in the Theory of Society* (1968), and so on.

From 1968 to 1974, he switched from academia into politics and pursued a political career in the German liberal party, which moved him from a seat in the 'Länder'-parliament in Baden-Württemberg to the German Bundestag and then on to the European commission in Brussels. He returned to academia and served as the director of the LSE from 1974 to 1984. In 1982, he was made a Knight Commander of the Order of the British Empire. From 1987 to 1997, he became the warden of St Antony's College at Oxford University. The most remarkable publications of this middle period were *Life Chances* (1979b), *The Modern Social Conflict* (2007b (1988)), and *Reflections on the Revolution in Europe* (2004 (1990)). Since 1993, Lord Dahrendorf served as a member of the 'House of Lords.' In 1995, he published his history of the LSE – his favorite institution, where he had studied and which he directed for 10 years – and in 2002, his short autobiography *Über Grenzen* (On boundaries). In his last years, he was showered with honorary degrees and prizes from all over the world. When he

died shortly after his 80th birthday on 17 June 2009, the obituaries talked about a sociological classic, a gifted politician, and an influential intellectual we had lost, the manifolded careers he had made, and the multiple boundaries he had crossed in the course of his life.

The Sociology of Conflict I

In *Class and Class Conflict in Industrial Society* (1959), Dahrendorf set out to develop his theory of conflict. He did so by a critical reexamination of Marx's class theory. Why Karl Marx? During the Nazi era, it was the organic concept of 'Volksgemeinschaft' (*literally* 'folk community'), which was said to hold together a modern society like Germany. Since the 'consensus' of the 'organic whole' was, above all, what mattered, every dissensus was persecuted as resistance against the regime. The attempt to conceive of modern society as a close-knit community, therefore, irresistibly led into oppressive totalitarianism. Marx, however, who followed a concept of modern society as an 'antagonistic whole,' had fully understood that the different groupings in society named 'classes' pursue divergent, if not antagonistic interests, which necessarily tend to clash in social life. Social life means 'eternal struggle' over who rules and who gets ruled. Societies under industrial capitalism envisage the confrontation of 'bourgeoisie' and 'proletariat' as the two opposing classes.

Dahrendorf shared Marx's agonistic view of social life, his focus on conflict, and his interest in class formation and class struggle. But he took Marx mainly as a starting point and tried to 'modernize' his theory of conflict. Dahrendorf mobilized the entire corpus of critique which had been brought forward against Marx from Max Weber and Joseph A. Schumpeter to Theodor Geiger. And he used the contemporary approaches like structural functionalism and conflict sociology to conceive of an adequate understanding of conflict in modern liberal and pluralistic societies.

Above all, he criticized the one-sidedness of the economics of class. The means of production are by no means the only basis of class formation. Property is one, but only one source of class formation and domination. Classes are not confined to the economy and the industrial realm, but may evolve in state and society alike. Dahrendorf uses 'class' in an analytical sense and sees it in an intimate relationship to domination. "Social classes and class conflict are present wherever authority is distributed unequally over social positions" (Dahrendorf, 1959: 247). In his eyes, class struggle is an expression of power conflicts. Since modern society is differentiated into a number of plural fields, the division of rulers and ruled can be found in every societal realm. Classes are not confined to the historical configuration of 'bourgeoisie' and 'proletariat,' but emerge wherever power and interest struggles between rulers and ruled take place. Apart from short periods of 'stasis' and stability, which a successful moderation and mediation of interests and conflicts entails, social life evolves by the dynamics of struggles over the distribution of resources and power positions. Society in that sense is in constant flux and social change the overarching feature of modern life. In Dahrendorf's (1959: ix) eyes, "'Classes' are interest groupings emerging from certain structural conditions which operate as such and effect structure changes."

Dahrendorf (1959: xii) sums up his achievement as follows: (1) the retention of the term 'class' for a theory that dispenses with the historical reference to antagonisms between 'bourgeoisie' and 'proletariat'; (2) the 'definition' of the crucial concepts of power and authority; (3) the separation and, in part, the confrontation of industrial and political class conflict; (4) the application of conflict theory to the analysis of contemporary society, especially to its 'ruling classes'; (5) the absence of grounding of this analysis on 'large-scale inquiries of a more "practical" kind.'

His first big and, maybe, best book *Class and Class Conflict in Industrial Society*, which earned him immediate fame, mirrors a discourse centered around three figures: Marx, Parsons, and Weber. Marx is crucial for Dahrendorf, since he underlines the agonistic and changeable character of social reality. In contrast to Parsons, who answered the Hobbesian question of social order with the institutionalization and internalization of values and norms, Dahrendorf puts forward the trias of power, conflict, and change. Not values and norms but power and authority, not consensus but conflict, not stability but change is what characterizes modern society. Although he dubs diplomatically his conflict theory as the necessary complement to the position of stability favored by the structural functionalism of Parsons, he takes boldly the counterposition to the American sociologist. This analytical conflict came to be known as the schism between consensus and conflict theory in the history of sociological theory building. The bridge for the confrontation between Marx ('conflict') and Parsons ('consensus'), however, was Max Weber. The main thrust of Dahrendorf's theory of conflict is Weberian: The agonistic view of social life as struggle, the separation between power and authority, the intimate relationship between class and domination, the conceptualization of classes as 'status groups' of a various kind, the ubiquity of conflicts which call for rules and regulations as means of their moderation and the exceptionality of the 'big conflict' called revolution as well as conflicts as the driving mechanism of social change – all of these arguments can be found in *Economy and Society*.

This Marxian (not Marxist)/Weberian mix was highly welcome since the 1960s among scholars who were neither Marxist nor functionalist. In Britain, sociologists like David Lockwood, John Rex, David Bottomore, John Goldthorpe, and Anthony Giddens followed this legacy by combining the sociology of conflict with race and class. In Germany, it was M. Rainer Lepsius, Walter Müller, and Karl Ulrich Mayer, who pursued the analysis of social structure and social inequality with political sociology. In France, it was above all Pierre Bourdieu, who developed an approach of class and styles of life.

The Sociology of Conflict II

Whereas *Class and Class Conflict in Industrial Society* pertained to macrosociology, Dahrendorf's famous *Homo sociologicus* referred to the microlevel of role analysis. His second classic again was a confrontation with structural-functionalism because role theory became a fashionable approach

particularly able to demonstrate the *systemic*, i.e., societal character of the individual conduct of life. Dahrendorf noted that economics created the concept of 'homo oeconomicus' and psychology the concept of 'psychological man' for their theoretical models, whereas structural-functional systems theory put forward the notion of a 'homo sociologicus.' According to him, this 'sociological man' is nothing but his role-repertoire. The category of role, a concept lent from the world of theater, seems ideal to pinpoint to the crosscutting of individual and society. Where individual and society meet, a role is created.

Interestingly enough and ironic though, Dahrendorf gave such a convincing exposition of this approach that the reception of his book in Germany took Dahrendorf as an ardent proponent of role theory. The contrary was the case. *Homo sociologicus* was written as a serious warning against the totalitarian underpinnings of this approach. If a human being is understood exclusively in terms of his or her role-complex, the dimensions of freedom and individuality get lost. Dahrendorf followed Simmel in that human beings are doubly constituted – as an individual being and as a social being. In Simmel's eyes, we stand with one foot in society, with the other outside of its realm. Otherwise, freedom and individuality would not be possible. Dahrendorf conceptualized the pragmatic paradox of a double human being and showed that role theory captured only one side of this duality: the social one. He demonstrated this one-sidedness in his paradigmatic example of 'Lehrer Dr Hans Schmidt' ('teacher Dr Jack Smith'). Jack Smith plays many parts: man, father, husband, academic, teacher, and so on. In his behavior, he tries to 'function' well because he fulfills all of these roles as best as possible. Roles are conceptualized as expectations with different degrees of bindingness: 'Must' expectations, which are legally binding; 'Should' expectations, which are morally binding; and 'Can' expectations, which are a courtesy. Socially formed roles seem to define a burden on the shoulder of the individual who longs to be free. Dahrendorf talked about 'die ärgerliche Tatsache der Gesellschaft' – 'the annoying fact of society' in order to mark this burden. Though roles conceptualize the crosscutting point of individual and society, there seems to prevail an antagonistic view of individual and society: Society spells constraint, individuality promises freedom. It is in the phrasing of Isaiah Berlin, negative freedom or the 'freedom *of*' society, which both liberal thinkers seem to articulate. Yet, as we will see, this image was corrected by later writings of Dahrendorf in favor of conceptualizations of 'freedom *in*' society.

Since Dahrendorf was influenced by Simmel in his understanding of the interaction between individual and society, he made out conflicting role-obligations as a potential avenue for the liberty of the person. Dr Smith might deliberately miss out on some of his family obligations by overstressing his professional role as a teacher. In this sense, the diligent management of conflicting role-obligations opens up a space for freedom. In Simmel's eyes, this mechanism, the 'crosscutting of social circles' with the result of a conflicting role-repertoire, formed the seedbed of individual freedom. But already Simmel conceded that this liberty amounts just to a 'freedom of' without specifying the 'freedom for' a particular style of life. Yet, again, in this microsociological setting of his sociology of conflict, Dahrendorf stressed the role of freedom and the place of and for individuality in a modern liberal society. He ardently defended the modern person against the encroaching impositions of an ever more demanding society which wants to subdue its members.

The Sociology of Conflict III

Dahrendorf's attempts to develop a theory of conflict culminated in the 1980s in his analysis of the *The Modern Social Conflict* (2007b (1988)). This article presents a synthesis of his thought in that it brings together all the elements of his loosely knit middle range theory of society: his concept of conflict with the twin concepts of power and liberty; his idea of life chances as options and ligatures; his notion of citizenship and civil society beyond state and market; the history of social conflict and before the background of this history the new quality of conflict today. He overhauls his conceptual tool kit and tells the tale of two conflicts and their contemporary 'Gestalt.'

In an earlier book on *Life Chances*, Dahrendorf (1979b) had set out to define them by the twin notion of options and ligatures. "Options are the choices which people have open to them; ligatures are the coordinates which give these choices meaning. Clearly, ligatures are the more complicated notion. I had in mind those deep cultural ties which help people find their bearings in the world" (Dahrendorf, 2007b: 17). In his new book, he continues to talk of life chances, but defines them differently. "Life chances are a product of entitlements and provisions" (Dahrendorf, 2007b: 16). The state gives citizenship rights as entitlements; the market produces goods and services as provisions. A free and liberal modern society needs them both. "The distinctions between politics and economics, chances of participation and standards of living, entry tickets and the choices which await the entrants – in short, between entitlements and provisions – are useful. But despite appearances to the contrary, there is no trade-off relationship between the two" (Dahrendorf, 2007b: 18). Dahrendorf refers to T.H. Marshall's characterization of the evolution of citizenship rights in order to ground his notions in the historical development. Marshall distinguished legal, political, and social rights and used the British case to ascertain that legal rights were won in the eighteenth, political rights in the nineteenth, and social rights in the twentieth century. The twin revolutions – the Industrial Revolution in England (provisions) and the French Revolution (entitlements) – and Marshall's trias of rights both provide the frame for Dahrendorf's reflection on the two thresholds of social change. The class society that Marx described in the nineteenth century was overcome by a society in the second half of the twentieth century, which created many more life chances for all and due to collective actors who took care of the interests of the majority allowed social mobility in a relatively open structure of stratification. Yet, in the 1970s, the social democratic consensus that had informed this model of society of the first threshold came to an end. 'Death by success' is the formula for this process. The world T.H. Marshall envisaged in the 1950s had become true. Ideas that approach their fulfillment lose their momentum and motivating appeal. They are bound to die out. "The rule of the majority class and of the eminently reasonable consensus of social democracy turned out to be unstable" (Dahrendorf, 2007b: 117).

This is not to claim that citizenship rights and the civil society were truly realized. Even the best of all possible worlds was far from being perfect. There were still entitlement barriers or deficient provisions for the lower end of the hierarchy of society.

Yet, societies in the 1980s had crossed the second threshold and faced a new modern social conflict. It turned out to be the gap between the 'majority class,' which comprises two-thirds or three-quarters of a society and a minority or 'underclass' forming the rest. The majority class struggles hard to keep its privileged place. In fact, it employs strategies of closure to keep the mobile parts of the underclass at bay and erects new boundaries against migrants from outside. Closure and exclusion, however, are not an adequate answer of an open society to migration and ethnic diversity. Barriers to entitlement and provisions undermine the growth of life chances for all – the main thrust of a modern liberal and democratic society in Dahrendorf's eyes. Yet, one reason why the strategies of closure and exclusion are successful is the fact that the 'minority class' has lost its power and energy to fight for inclusion. Dahrendorf is taken by surprise about the lack of struggle and resistance: "Why do the long-term unemployed and the persistently poor not join forces and march on their capital cities to demand their full share of citizenship? Why is there not at least an unemployment party or a poverty party? And if this asking too much, why does the underclass not go on a rampage to break up the furniture of the house which the majority class built for itself?" (Dahrendorf, 2007b: 160). The 'Lumpenproletariat' in Marx's times and the underclass today share the same conditions. They are in a state of deep anomie in the Durkheimian sense and a state of alienation in the Marxian sense. "The crucial fact about the underclass and the persistently unemployed is that they have no stake in society. In a very serious sense, society does not need them. Many in the majority class wish that they would simply go away; and if they did their absence would barely be noticed. Those who are in this position know it. Society to them is above all distant. It is symbolized by nothing so much as the police and the courts, and to a lesser extent by the offices and officials of the state" (Dahrendorf, 2007b: 161).

This split between the majority class – furnished with a full set of life chances and firmly established 'inside' of society – and the minority class – confronted with barriers to basic entitlements and provisions and situated 'outside' of society – is the major driving force of anomie and alienation on the one hand, the reason for a lack of ligatures on the other hand. A society that leaves considerable parts of its population behind with no stake in its fabrique will fail to develop a sense of cohesion and belonging, of inclusion and integration.

In a truly liberal vein, Dahrendorf proposes a new social contract which should tackle the central problems of contemporary society. In order to avoid the formation of an underclass in the societies of the OECD world, he is in favor of a basic income for all, realized by a negative income tax system. On a global scale, he makes a strong case for the creation of a world civil society. "Whatever a world civil society may eventually look like, it will be one which, as Kant put it, 'administers law among men.' Freedom under law begins with the universal recognition of human rights. Fighting for such recognition is another task which matters" (Dahrendorf, 2007b: 189).

The Erasmus Intellectuals

The architecture of liberty – the framework of a liberal and democratic society – rests upon the quest for freedom, the creation of life chances, and the power of conflicts as the driving force of social change. This institutional arrangement, which Dahrendorf envisaged in his sociology, would be incomplete without a particular class of people. Intellectuals have to be the watchdog of and for a liberal order. Those high priests of reflection, deliberation, and critique, however, have often failed in their vision and mission. As the history of this class aptly tells, they have often fallen prey to particular ideologies and radical parties. An intellectual who turns partisan loses his freedom to criticize and his independence of judgment – in Max Weber's words, his intellectual probity.

In his late writings *Engagierte Beobachter* (*Engaged Observers*, 2005) and *Versuchungen der Unfreiheit* (*Temptations of Bondage*, 2006), Dahrendorf set out the conditions under which intellectuals keep their independence of judgment and their freedom to critique. Intellectuals in times of crisis need four basic capabilities to fulfill their task as engaged observers:

1. They need to have the capacity to be independent thinkers who manage to resist the pressures of hegemonic ideologies.
2. They must have the force and power to stand antagonisms and conflicts of life and not be seduced by the temptation for 'harmonization' or the 'reconciliation' of antinomies.
3. They have to act as passionate and critical observers who assess political phenomena and social developments with a keen sense of sober realism.
4. They all have to share the position that reason is the foundation of every theory and practice.

Dahrendorf does not claim that the traits of his concept are highly original or new. In fact, the embodiment of them and insofar the paradigmatic figure in the history of intellectuals is Erasmus of Rotterdam. Erasmus in his thought and action displayed this bundle of freedom, independence, and disinterestedness. This is why Dahrendorf names intellectuals able to withstand the temptations of bondage as 'Erasmians.' It is an exclusive club which Dahrendorf, himself a founding member, brings together. Among them are Raymond Aron, Isaiah Berlin, and Karl Popper, who inspired this concept. But he counts in all intellectuals who engendered the revolution in Eastern Europe and withstood the 'totalitarianism' of communist rule.

Conclusion

Throughout his life, Dahrendorf worked at his sociology of conflict. As the three attempts mentioned here demonstrated, he set out to develop his approach in line with Karl Marx's class theory. He modernized Marx with reference to Max Weber in order to find out how the creation of life chances and the possibility of freedom could be realized in the framework of a liberal and democratic order. Much depends on the state and the market to open up life chances as options and ligatures, as entitlements and provisions. T.H. Marshall's model underpinned Dahrendorf's search for citizenships rights and their realization as entitlements guaranteed for all. But a liberal and

democratic society needs active citizens and critical Erasmian intellectuals who as civil society participate in the making of an open society. People as citizens have a stake in their society and fight in multiple conflicts over the course their society and the world is taking.

From the outset, Dahrendorf's antagonist was Talcott Parsons and structural-functionalism, which had overstressed values and norms as integrative mechanisms of society and underemphasized the role of conflict for social change. Dahrendorf's critique helped to form the paradigm of conflict as the counterpart to an alleged paradigm of consensus. But unlike Parsons, Dahrendorf never developed a grand theory. He rather followed Robert K. Merton, who advocated middle range theories. His œuvre displays no coherent and consistent theory but many steps to decipher the logic and dynamic of modern societies. Dahrendorf has no system but only a systematic approach, which he applies to different problems and phenomena. His style of thinking was both analytical and normative in that he always saw the world through the lenses of a liberal worldview.

His liberalism had nothing to do with neoliberalism, market radicalism, and the making of good times for the happy few. His social democratic family background – for him, the world of decency – and the fact that he was a sociologist, not an economist, gave his unconventional liberalism a human face. This character reflects one of his own definitions: "The possibility of progress is a condition of the battle against error. Thus we have almost defined liberalism: misanthropy plus hope; the attempt to link the practical necessity of power as intimately as possible with the greatest life chances of the greatest number; faith in the strength and the right of the individual, tempered by doubt in the perfection of things human; a little morals and a little epistemology" (Dahrendorf, 1979b: 96).

Dahrendorf was a prolific writer as the long list of publications testifies. He wrote with style and grace. In short, he was brilliant. His books did not address first and foremost his fellow social scientists, but a broader and learned public. He was a highly gifted storyteller, and he could approach the most difficult problems in a light tone, yet not superficially. Even dry discussions of concepts were couched in a talelike form and made fun to read. Most of his publications show the author's favorable form: the essay. In the professional world of today, his articles would have no chance to get published: too few footnotes, too few figures, too few publications cited from the professional field of the problem at hand. What they lacked in alleged 'professionality,' Dahrendorf's essays exhibited in intellectual content: A clear sense of the problem – what the French call a 'problématique;' an impressive capability for sober and precise judgment; the framing of the argument by embedding it in the entire cosmos of knowledge since the classics of antiquity; lessons of philosophy, history, and the social sciences woven together into a compelling argument; a sharp and concise analysis of the problem under review; the attempt to offer solutions to the problem, however preliminary and imperfect. In short, Dahrendorf's articles offered to learn something, whereas most of the professional papers by sociologists today offer information which one had not asked for in the first place. This intellectual mind-set and broad horizon he shared with his fellow liberals, Raymon Aron in France and Isaiah Berlin as well as Karl Popper in England. Since he left us, Dahrendorf's position in academia, this curious *mélange* of liberalism, social, and political theory, remains vacant.

Abstract

Dance as a topic for systematic anthropological investigation was established in the 1960s. As the Western category of dance did not always work in a cross-cultural perspective, bounded rhythmical movements were identified, as well as dance events. Dance is an expression of wider social and cultural situations, often indicating transition or conflict, as well as unity. Dance anthropologists study all forms of dance, Western and non-Western, ranging from ritual dance and social dance to street dance and staged dance performance. Dance and movement are understood in relation to theories of the body and gender, and to ethnicity, nationalism, and transnationality.

Dance has been studied in anthropology for over a century; it has also been studied in classical works, but mostly in passing as an element in ritual and ceremony. This neglect is likely to have come about because of the elusive nature of dance, in combination with the fact that dance has the potential of releasing emotional and erotic forces that are kept at bay most of the time in everyday life. There are many examples of political and religious control of dance, not least in colonial contexts. This has often produced resistance, expressed through the creation or revitalization of ethnic and national dances.

In an article about the beer dance among the Azande, E. E. Evans-Pritchard (1928) was among the first anthropologists to show that the study of dance had a wider analytical potential and that dance needed to be understood within a social and cultural context. More than 30 years later, Gertrude P. Kurath (1960) wrote an article outlining research on dance in American anthropology. A dancer herself, Kurath stressed the importance of dance training for the anthropological study of dance. This article prefigured the emergence of the anthropology of dance as a subdiscipline in the 1960s and 1970s, which was consolidated by Anya Peterson Royce's foundational *The Anthropology of Dance* (2002), first published in 1977. There is also the recent volume (in French) edited by Andrée Grau and Georgina Wierre-Gore (2005) for the early history of dance research in the United States and Europe. At first, the anthropological focus on dance stimulated discussions about the origins and definition of dance that became complicated by the cross-cultural perspective. As Adrienne Kaeppler (1985: p. 93) has remarked, the concept of 'dance' is a Western category that often fails to distinguish among different cultural activities. This concern is also paralleled, however, in the anthropology of music and the arts. Drawing on her research in Tonga, where movement around ceremonial pig presentations, *kava* mixing, and choreographed group speeches revealed hierarchy and social solidarity, Kaeppler suggested 'structured movement systems' as an alternative concept to dance. Another anthropological strategy has been to identify *dance events* as units of study, rather than to look for particular dances in isolation. On the whole, dance anthropologists seem to converge on a consideration of bounded rhythmical movements that are performed during some kind of altered state of consciousness, an elevation or even trance.

The pioneering dance anthropologists had to deal with the ethnocentric assumptions, prevalent among the then mostly autodidactic dance historians, about dance as a universal language and 'primitive dance' (often constructed in terms of a generalized 'African dance'), as an early phase in a Western scheme of dance evolution entailing a hierarchizing where ballet was regarded as a superior dance form. This prompted Joann Kealiinohomoku (1983) to write an article where she argued for a view of ballet as an ethnic dance, as one dance form among others. This is a crucial anthropological contribution to dance scholarship, but Kealiinohomoku's idea that ballet reflects Western cultural traditions is perhaps a bit exaggerated, especially in the long run. Admittedly, Western classical ballet speaks to a limited historically dominant segment of the West, in contrast to the shifting multicultural landscape of contemporary Europe and North America. To state that ballet is a form of ethnic dance also disregards the traditional difference between ethnic dance as a participatory ritual practice and ballet as a stage art performance separated from the audience, although ethnic and folk dance are now frequently moved from secular and sacred ritual to the realm of art in stage dance. The genres are further blurred by contemporary stage dance experiments with the audience taking part in the performance and even being invited to go onstage, as well as by so-called site-specific dance often being performed outdoors in city parks and subway stations, but also in rural places such as in the forest.

The central quest and *raison d'être* for the anthropology of dance have been to find out what dance says about its society, informing about social or cultural circumstances that cannot be sufficiently expressed in any other way. As the contributors in Paul Spencer's *Society and the Dance* (1985) show, this comes about not only through direct reflection but also through social commentary and critique in the form of parody-like (gender) role reversal, suggestions about alternative social scenarios, and even predictions of political events. Dance has increasingly been recognized as having an impact on social change. But there is also the cathartic view of dance as a safety valve, a structural outlet, which will keep the social order and its inequalities intact. Dance is moreover often a feature of socialization. One of the functional aspects of dance is that of transformation: the classical examples are rites of passage where people are moved from one stage in the life cycle to the next one, such as initiation rites, wedding celebrations, and funerals.

Like all subdisciplines, the anthropology of dance has followed main theoretical currents in its parent discipline.

Dance has thus been analyzed through structuralism, symbolic anthropology, semiotics, and linguistic theory, generating studies of the deep structures of dance and dance as nonverbal communication. Taking these theoretical approaches as points of departure, some of the first dance anthropologists worked out their own elaborate models and classificatory schemes for movement analysis. Drid Williams's (1976; see also Williams, 2004) theory of semasiology, the meaning of human movements as action signs, for instance, has been developed further by Brenda Farnell (1995) in a study of Plains Indian sign language. With dance cases as nonverbal communication ranging from rural West Africa to the stage in New York, Judith Lynne Hanna (1987[1979]) showed how dance can be understood through communications theory.

There are basically three kinds of anthropological studies of dance. One kind has dealt with meaning, function, and the cultural context of dance, and another kind has concentrated on the choreographic form. The majority of anthropological studies of dance, however, has combined these approaches by taking both meaning, function, and context *and* choreographic form into account, and has included textual descriptions of the movements and/or illustrations such as photographs or simple movement transcriptions, consisting of circles and arrows that indicate directions and patterns of dance.

In the United States, research on dance in its cultural context has dominated, just as in the United Kingdom where John Blacking was a key figure in the emerging interest in the anthropology of dance. In continental Europe, dance ethnologists, also called choreologists, who came out of a long nationalist folklore tradition, documented folk dances in their own societies for preservation and revival, stressing formal characteristics along the lines of music research there. During the Communist era in Eastern Europe, dance (and other folklore) researchers found themselves in ideological conflict over state manipulations and control of their research (Giurchescu and Torp, 1991). Anthony Shay (2002) has documented how state-sponsored national dance companies from countries such as the former USSR as well as Turkey, Egypt, and Mexico accommodated their repertory and choreography to the prevalent state politics.

In the 1980s, a new generation of dance anthropologists joined the growing transdisciplinary area of dance and movement studies. By engaging with feminist and gender critiques, notions of the body, identity politics, and literary and cultural studies, scholars of dance and movement studies became more visible in the academic world, and also because there was an increasing number of them. With dance historians and scholars such as Helen Thomas (1995), Jane Desmond (1997), Teresa Jill Buckland (2006), and Susan L. Foster (2011), dance scholars have moved toward ethnography and social and cultural theory, redefining their field as critical dance studies, while dance anthropologists have added Western stage dance and culture, as well as European folk dance, to their previous focus on non-Western dance and movement. Most dance scholars, including dance anthropologists, have been trained as modern and/or classical dancers. The anthropological study of dance usually requires participation in the dancing, or at least some kind of bodily knowledge of the steps that are investigated. The fact that dance anthropologists learn sequences of steps and movement that are completely different from their earlier movement experiences is something they often report on in a humble spirit, while it actually deserves recognition not least as an important methodological strategy. Some dance anthropologists have thought of their own dancing in the field as a part of the reflexive turn in anthropology, which has also had an impact on the anthropology of dance. The volume *Dance in the Field* (1999), edited by Buckland, brings together methodological deliberations on a wide variety of dance forms at home and abroad around issues of representation, reflexivity, and ethics.

Moving Bodies, Gender, and Sexuality

In the upsurge of studies in the human sciences on the body as culturally constructed, the *moving* body has nevertheless been marginal, as Susan Reed (1998) notes in her review article of the anthropology of dance, except in recent dance scholarship including dance anthropology where it has been prominent, often in tandem with issues of gender and sexuality. Such aspects were early identified by Judith Lynne Hanna (1988) in a cross-cultural panorama of different dance forms. Also, Helen Thomas (2003) delves into how moving bodies, whether in dance forms as diverse as ballet, contact improvisation, or rave, offer ideas on the politics of identity, while Eduardo P. Archetti (1999) has compared masculinities in football, polo, and tango in Argentina.

By now, a number of monographs that combine attention to moving bodies, gender, and sexuality have appeared. Jane Cowan's (1990) work on the body politics of gender in a town in northern Greece focuses on dance events, including, for example, lively wedding dances that unite a contradictory ideology of inequality and visions of closeness in the dancing bodies. For the women, dance is an ambivalent pleasure since they have to balance their sexual expression carefully between release and control; unlike that of the men, women's dancing demeanor always runs the risk of being interpreted as indecent. This is also a problem for the professional female entertainers, singers, and belly dancers in Cairo who Karin van Nieuwkerk (1995) writes about, who see their job as 'a trade like any other.' Performing at celebrations such as births, engagements, and weddings, these Egyptian entertainers create much happiness and are, in fact, crucial for the success and prestige of these occasions. Nevertheless, they are regarded as dishonorable in the context of Islam and class in Egyptian society because they make a living out of disclosing their bodies in public, thereby tantalizing men. In Cynthia Novack's (1990) ethnography of contact improvisation, the American communal art-sport that emerged in the 1960s, gender relations are quite differently featured in line with the prevailing ideology of egalitarianism. Although the body is constructed as nongendered in contact improvisation, the performers' touching and supporting of each other's weight while moving together, usually in duets, sometimes produce sexual and sensual feelings among both them and the observers.

Novack's study spans more than two decades, showing that the movements of contact improvisation, and thus the construction of these moving bodies, and the arts organizations around them followed changes in American culture so that this dance form gradually diminished together with the

egalitarian agenda of the 1960s and 1970s. A different type of body politics is articulated through Brazilian samba, which Barbara Browning (1995) writes about as a form of political resistance. Body and space are in focus in Sally Ann Ness's (1992) interpretation of the *sinulog* danced in Cebu City in the Philippines. Ness connects dance movements and space to everyday movements like walking and the urban landscape of Cebu City. A Philippine ballet, *Igorot*, which Ness (1997) discusses, produces neoethnic bodies in a structure of postcolonialism and transnationalism. J. Lowell Lewis (1992) also links everyday movement and dance movement in Brazilian *capoeira*, the martial art and dance with roots in Brazilian slavery and, further back, in Africa. Lewis analyzes *capoeira* as a cultural style through the metaphor of play: bodily, musical, and verbal. Learning *capoeira* in Salvador, Brazil, is Greg Downey's (2005) area, as he observes the bodily training having an influence on perception according to a phenomenological perspective. The significance of the black dancing body in the United States is evident in Brenda Dixon Gottshild's (2004) book. In 2005, Bryan S. Turner edited an issue of the journal *Body & Society* on 'the dancing body.' Even though the issue deals with a variety of topics, it was prompted by the ethnography that Steven P. Wainright and Turner (2005) did for their research on injuries and aging among ballet dancers. Applying a broad perspective, Farnell (2012) has pursued her interest in the body, mind, and movement by building an ontological theory of embodiment.

Ethnicity, Nationalism, and Transnationality

Ethnicity and nationalism are often negotiated through dance, but in different ways depending on historical and political circumstances. J. Clyde Mitchell's (1956) small classic monograph on the Kalela dance in colonial northern Rhodesia is an early instance of ethnic dance. The Kalela dance was performed every Sunday by labor migrants who had moved from the countryside to the town of Luanshya. While describing colonial society, the dance was also a marker of a 'tribal' group identity called for in contrast with other groups in the town. The European folk dances that European dance ethnologists have long been documenting can be categorized as ethnic dances. Yet it was the growth in studies of nationalism in the social sciences generally that inspired dance anthropologists to investigate ethnic and national dance. Located in postrevolutionary Cuba, Yvonne Daniel (1995) discusses how the government replaced ballet with rumba as the Cuban national dance. Rumba was associated with the working class and the African heritage, which suited the socialist state ideology. Studies of Javanese court dance exemplify the wider escalating concern with questions of representation, authenticity, and appropriation. In a study of the *devadasis*, female temple dancers in South India, Joan L. Erdmann (1996) points out that it is time to rewrite the history of Indian dance without Orientalism such as the Western label 'Oriental dance,' in order to make room for indigenous categories. More than a decade later, Felicia Hughes-Freeland (2008) explored how the embodied tradition in Javanese colonial court dance has turned into a national dance that influences everyday movement. And Janet O'Shea (2007) shows how the history of the Indian dance *bharata natyam*, which is danced across the world, follows the history of India. Martha Savigliano (1995) applies a transnational perspective in her study of tango in Buenos Aires, Paris, and Tokyo. Her point of departure is the political economy of passion ideas of machismo and postcolonialism. Also, flamenco is connected with passion, as William Washabaugh (1996) points out: this popular culture had a political impact during Franco's reign in Spain. The transnationality of the salsa scene in Montreal, Canada, is scrutinized by Sheenagh Pietrobruno (2006), who contextualizes this in the city's economy. Tango and salsa are among the Latin dances that can be included in ballroom dance, among waltzes and other European social dances. Competitive ballroom dance, so-called dancesport, as a global arena, has been studied by Jonathan S. Marion (2008).

Ritual dance is firstly conceptualized as a conduit for national identity and ethnicity by Zoila Mendoza (2000) in relation to dance in the Peruvian Andes, and secondly by Deirdre Sklar (2001) in relation to a Virgin of Guadalupe fiesta dance in New Mexico in the United States. Francesca Castaldi (2006) writes about the National Ballet and Senghor's Négritude in Senegal. The politics of race and African American culture in the United States is examined by Thomas F. DeFrantz (2004) through the history of the Alvin Ailey American Dance Theater. Helena Wulff (2007) has related Irish dance forms, including traditional folk dance, Irish dance theater, and Riverdance (the Irish dance show), to the development of Ireland as an independent nation. Although most dance anthropologists seem to agree that all dance forms are more or less mixed, with increasing global contacts, ethnic and national dance forms are becoming even more mixed than before. *Igorot*, the Philippine ballet that is a mixture of classical ballet and traditional Philippine dance, has been described as an instance of cultural hybridity (Ness, 1997). Drawing on Howard Becker's (1982) notion of art worlds, Wulff (1998) explores homogeneity and diversity in the transnational world of ballet.

Mediation and Preservation

As dance is elusive, its movements are difficult to document for preservation, distribution, or revival of performances. Dance is mediated to a great extent through text, scholarly as well as journalistic, a fact that is pondered by Sally Banes et al. (2007). To convey movement through the text is an obvious ambition for dance anthropologists. In her little book on tango and the multidimensional national Argentine identity, accurately entitled *Paper Tangos*, Julie Taylor (1998) has inserted small black-and-white photographs in the margin on every page. A quick flipping through the pages thus creates an image of motion, of a couple dancing the tango.

In addition to simple figures illustrating the text, some dance anthropologists have learned advanced standardized notation systems for transcription and preservation of movements, such as Labanotation, which is the most widely used, or the Benesh or Eskhol–Wachmann notation systems. The period of organized training to master any of these systems completely is often said to be like that of learning another language. In the Western dance world, trained notators, or choreologists, document ballet and dance productions through these systems,

and they have also been important in the medical rehabilitation of disabled people. There is, however, a degree of interpretation involved in the notating process, which means that different notators may describe the same movement somewhat differently. In *Choreographics* (1989), Ann Hutchinson Guest discusses in great detail a number of historical as well as contemporary dance notation systems. For notators, dance notation has been available in software, LabanWriter, for some time, and recently as an iPad app. In dance anthropology, there has been a discussion about the applicability of these Western notation systems to non-Western dance and movement forms, although there seems to be agreement that they can be used for such purposes as well. Certain conventions have developed to deal with cultural translation problems, so that the particular use of Labanotation, for example, may be explained in a 'key' for readers.

Photography and film are other, often complementary, media for conveying and preserving dance and movement. There is, however, an element of cultural selectivity in their use, as in film and video recording, which has increased substantially. Video and film have also become significant aids in the mechanical work of drawing the symbols for the scores of Labanotation and the Benesh notation system. The expanded use of technology in dance research has accentuated questions of copyright and ownership, which are further complicated in a transnational cross-cultural context. The area of dance and mediation, also including television, DVDs, and certainly the Internet, is generating an accelerating amount of new research, as exemplified by Susan Kozel's (2008) work with and about digital dance and phenomenology.

Future research in the anthropology of dance is likely to include more systematic reception and audience research. The anthropological inquiry into dance is being extended to popular dance genres such as rave, dance shows, and dance in musical videos, and to world dance, in both Western and non-Western contexts. Street dances, such as breakdance in Mary Fogarty's (2012) research, and flash mobs, the sudden, brief mass dances in public places that are arranged through mobile phones and Facebook, studied by Georgina Gore (2010), are also emerging topics for anthropological dance research; so are health and healing, which Karen Lüdke (2008) has related to the tarantula rite in southern Italy. Also disability, as in Ann Albright Cooper's (1998) work, is attracting scholarly attention. Dance and the senses is yet another emerging topic in the anthropology of dance, as shown by Tomie Hahn (2007) in her account of the traditional Japanese dance, *nihon buyo*. Even issues such as human rights and social movements are expanding areas for dance research, as Naomi Jackson and Toni Samantha Phim (2008) show. Unlike the anthropology of music, which attracts mostly men, the majority of dance anthropologists have been women. This may have played a role in the relatively modest position of the subdiscipline, at least in the past. Its present growth is shown in the volume *Dancing Cultures* (2012), where the editors Hélène Neveu Kringelbach and Jonathan Skinner argue for the importance of dance in social life, in relation to social change. They explore the shift of movements between dance and nondance contexts.

The anthropology of dance keeps contributing to central debates in the human sciences, especially to an understanding of culture in terms of process and diversity. Importantly, dance and movement not only are shaped by society but also shape society. This occurs in increasingly complex ways as the genres of dance and movement in society shift and grow, inviting more studies of the anthropology of dance.

Dark Triad: The "Dark Side" of Human Personality

Peter K Jonason and James P Middleton, University of Western Sydney, Milperra, NSW, Australia

Abstract

Most of work in personality psychology has focused on the Big Five traits. However, recent research suggests the Big Five may be insufficient in that it is atheoretically derived and may inadequately assess the 'darker' sides of people's personality. An emerging stream of research has attempted to address this by studying what is called the Dark Triad of personality (i.e., narcissism, psychopathy, and Machiavellianism). In this article we attempt to discuss the Dark Triad traits on their own and as a group, we cover different methodological and theoretical considerations, and end by offering some suggestions for the future.

Personality psychology, also called differential psychology, has a long history. The field is concerned with systematic variation between individuals, what causes those differences, how we can document those differences, and how those differences track with real-world outcomes. The best studied set of personality traits are the Big Five traits of extraversion, agreeableness, neuroticism, conscientiousness, and openness. These traits are based on words identified as adjectives people use to describe one another (viz., the lexical assumption) through the use of various factor analytic techniques. While other factor structures exist (e.g., Cattell's 16 Factors; the PEN Model), the Big Five have dominated the last 60 years of research in personality psychology, finding application in all fields of psychological inquiry.

As popular and useful as the Big Five is and as good as the Big Five is at covering a broad range of personality traits, it tends to be limited in two important ways. The Big Five is a set of atheoretically derived, descriptive adjectives and it tends to better tap 'positive' aspects of people's personality over 'negative' or 'darker' sides. This has created two streams of research, both highly informed by evolutionary or interactionist approaches to understanding within-species variation. One group has focused on expanding the list of basic personality traits; developing what is called the HEXACO. These researchers have focused on the added predictive power of measuring individual differences in people's honesty and humility. However, this approach is still heavily reliant on factor analytic techniques.

The other – perhaps the newest – stream has focused on what are called the 'Dark Triad' of personality traits (i.e., narcissism, psychopathy, and Machiavellianism). Unlike the Big Five or the HEXACO, the Dark Triad traits – as a collective – were not derived through inductive factor analytic techniques, but were, instead, linked based on theoretical observations about the overlap of the behaviors and nature of these traits. Importantly, they also are concerned with 'darker' aspects of human nature.

In this article, we discuss the work on the Dark Triad. In particular, we attempt to highlight the apparently good and bad aspects of these traits. This is essential in that even the worst traits confer some benefits if viewed from the proper perspective. As reviewed elsewhere, the predominant way of seeing these traits may be biased toward prosocial outcomes. That is, if the traits cost the group like in the case of crime, then they are solely seen as bad. We feel this is overly simplistic. Crime is pursued to derive short-term benefits to the criminal at the cost of others. We would argue that research has only focused on the latter half of this last sentence. Apparently costly behavior for the group could have real benefits (e.g., food, mates) for the individual. Even still, the individual may suffer from some disadvantages but, if these traits gear an individual toward maximizing short-term gains as we will argue later, these may be costs he or she is willing to pay.

The Costs and Benefits of the Dark Triad

Narcissism

Narcissism is based on the Greek myth of Narcissus who fell in love with his own reflection and was later identified as a personality disorder. Indeed, most conceptualizations of narcissism have included some dimension of vanity. However, there is a general agreement that narcissism is also composed of other traits like grandiosity, a sense of superiority, and entitlement, although the necessary and sufficient number of factors is a matter of considerable debate. Importantly, narcissism is not simply high self-esteem, though it is positively correlated with it. In fact, narcissism has different effects on aggression depending on the type of self-esteem someone has. In those with stable self-esteem, narcissism is positively correlated with attitudinal aggression, whereas in those with unstable self-esteem, narcissism is negatively correlated with attitudinal aggression. Alternatively, those high in narcissism aggress in response to ego threat as opposed to other threats. Narcissism is a disposition toward an egocentric lifestyle, in which the needs of the self is placed above the needs of others.

One of the hallmarks of narcissism is its inescapable social aspect. Narcissists desire admiration and attention, they wish to feel superior within social circles, and this ties them inextricably to other people. Thus, narcissists employ strategies, which involve improving their relationships with other people. For example, narcissists tend to be overconfident at everything they do, regardless of how good they are, and report being far more competent than others at tasks. While most people tend to overestimate their abilities, narcissists tend to overestimate their abilities more than others. This overconfidence can have

a beneficial effect for the person however, as others are more likely to see them as good leaders, even if their narcissism tends to actually negatively influence group performance. For instance, this overconfidence in their ability leads them to being more resilient in the face of failure.

While it can be difficult for a narcissist to maintain relationships in the long term, they do have a number of advantages in the beginning stages of social relationships. Similarly, narcissism has been linked with other factors with positive social benefits, including higher extraversion, a more affiliative humor style, higher IQ, and a socially charming disposition. Narcissism may even offer some positive effects including self-protective memory biases, the maintenance of one's self-concept across both high- and low-achieving peer groups, increased within-group creativity, and short-term mating success. That said, narcissism remains linked to poor judgment in other areas. Specifically, narcissism has been linked with a higher rate of gambling, as well as an increased amount of money spent on gambling, and these links are mediated by overconfidence, increased risk acceptance, and focus on rewards. Additionally, in tasks where groups of people are asked to harvest a slowly regenerating resource, group performance was worse overall when narcissists were included, as narcissists would tend to overharvest and exhaust resources quicker than others. It seems reasonable to conclude that the Dark Triad may have some short-term benefits and some long-term consequences.

Psychopathy

Like narcissism, psychopathy traditionally was considered a clinical diagnosis and was adapted to measure a nonclinical construct in the general population. This construct includes such things as impulsivity, criminality, aggressiveness, callousness, limited empathy, and low fear. This has resulted in psychopathy being labeled the 'darkest' of the Dark Triad traits. The term carries with it the worst connotations and is a term commonly ascribed to criminals in real life and in the media. In fact, we would contend that the common usage of this term and the tendency to link this term with 'bad' people may actually interfere with clear thinking about this trait more so than the other Dark Triad traits.

Just like narcissism, psychopathy appears to be a mixed bag of some beneficial and some deleterious aspects. One interesting finding from such studies is that successful psychopaths (i.e., those that do not get institutionalized) have heightened cardiovascular stress reactivity and perform better on the Wisconsin Card Sorting Test (i.e., a measure of cognitive function) compared to unsuccessful (i.e., institutionalized) psychopaths. Furthermore, significant neurological deficits have been found in unsuccessful psychopaths, including greater hippocampal asymmetry, and a 22.3% reduction in prefrontal gray matter volume.

Despite being a socially aversive trait, psychopathy is not entirely without benefits. While psychopathy tends to be linked with low conscientiousness and low agreeableness, it is also linked with low neuroticism, an ostensible benefit. Similarly, psychopaths have lowered stress responses in real-world environments such as appearing in court. This fits the general pattern of impulsiveness, shallow affect, and sensation seeking, typical of those high on psychopathy. Additionally, some have argued that psychopathy, while having a number of difficulties in long-term scenarios, has a number of short-term advantages. For example, the aggression and short-term mating success all suggest psychopathy might provide some adaptive benefits. If one thing has been made clear in the literature, it is that psychopathy is not the purely negative, maladaptive, and pathological disposition, it is often considered to be.

Machiavellianism

While the other traits of the Dark Triad were initially pathological disorders that were adapted into measures for nonclinical populations, Machiavellianism was developed for social psychological research. Researchers took inspiration from Niccolo Machiavelli's work *The Prince* to construct a trait characterized by cynicism, manipulativeness, and a pragmatic morality. This construct, being based on Machiavelli's work, was termed 'Machiavellianism.' These traits might be instrumental for princes (and people) to rise in social and political hierarchies in medieval Europe and today. The trait is considered to have an instrumental way of dealing with others, a protean or whatever it takes style of social influence, and an opportunistic approach to economic exchanges or work behavior. For instance, it is linked with the adoption of both *hard* and *soft* tactics of social influence in the workplace. This range of tactics may better equip those high Machiavellianism to influence others to bending to her or his will.

Much like the other factors of the Dark Triad, Machiavellianism has costly aspects. While high Machiavellian individuals tend to rank high on social charm and manipulativeness, Machiavellianism is negatively correlated with self-control, emotional intelligence, and social competency in both intimate and exposed settings. However, seeing these as costs might be overly simplistic. It has recently been argued that limited empathy could itself be advantageous to people motivated to take advantage of others. The idea being that if one understood the feelings of others, it might inhibit their ability to exploit others to their own ends. Indeed, those high on Machiavellianism appear to be skilled liars. Nevertheless, like the other two, the costs and benefits associated with Machiavellianism depend on the context.

Overlap and Distinctiveness

Contemporary research on the Dark Triad has seen a great deal of debate as to whether the Dark Triad should be treated as a single construct, or whether it is best to treat it as a three-factor solution. Essentially, this debate revolves around two questions. First, which explain more variance in people's behavior, attitudes, and cognition, the three individual traits or a collective, composite of the three? Second, might the Dark Triad be tapping some underlying latent personality trait?

Unificationism

Proponents of the view that the Dark Triad can be used as a single construct argue the collective allows for higher-order theoretical predictions, whereas the three traits on their own

show the mechanisms by which the latent construct relates to certain outcomes. The point here is that the three traits are imperfect measures of the same or a similar latent disposition. Taking a logical positivism perspective, they contend that personality traits are convenient fictions that allow us to talk about these traits; the traits themselves are not real themselves.

Evidence for the utility of a unitary construct comes in a number of forms, all implying there is an underlying core behind the Dark Triad. First, there are a wide range of personality traits that appear to link the Dark Triad traits together: Agreeableness, dishonest/immodesty, limited empathy, short-term mating, future discounting, and callousness. Second, factor analyses suggest that the three load on a single factor well and account for over 50% of the variance in each construct. Indeed, at least one measure of the Dark Triad returns better fits for structural models that take into account a latent, global factor. Third, so there is at least one case where the latent construct outperforms the three traits on their own when assessing sociosexuality. Fourth, it might be that these traits are simply reflections of similar a disposition with different researchers making the measures, coming from different perspectives, and focusing on different aspects of the underlying profile. That is, we should not assume that because a given trait as conceptually been about X that the original conceptualization was correct.

Separationism

Their opponents argue that some important relationships can only be found when examining the factors within the Dark Triad, and that it is only through this kind of examination that a fuller, deeper understanding of the construct can be found. They would contend that simply because there are relationships between the three does not mean they are equivalent; after all, the traits of the Dark Triad were chosen *because* they shared a socially aversive component. It should be expected that any set of traits selected to represent the 'dark side' of human personality should, by definition, share a core of being 'dark.' These researchers point the Dark Triad do show some differences in important ways. For example, while both narcissism and psychopathy can predict attitudinal aggression, narcissists tend to aggress toward ego threats, whereas psychopaths tend to aggress toward physical threats. Other factors, such as IQ, are related only to narcissism, while only psychopathy is related to neuroticism, and even within studies showing similar relationships between the three traits, there is often a difference in how strong those relationships are. If some relationships can be isolated to a single trait, and we can see differences in how well each trait can predict other factors, then the claim that they are identical seems inadequate. Indeed, examinations of the various subfactors of narcissism and psychopathy have revealed that it is even suspect to treat the Dark Triad as unified constructs. For example, secondary psychopathy, exploitive narcissism, and Machiavellianism have been linked with a *fast* life strategy, whereas primary psychopathy and grandiose narcissism have been linked with a *slow* life strategy. Additionally, the same cluster of traits related to a 'fast' life strategy (i.e., secondary psychopathy, exploitative narcissism, and Machiavellianism) have been linked with an evening chronotype.

A Resolution?

The most reasonable position might be to just examine all three levels (i.e., the collective, the three traits, and the parts of the traits). Doing this will allow researchers to test the conditions under which each perspective has its utility and to get a high degree of resolution about the loci of the various relationships they investigate. We would contend that the collective is useful for making higher level predictions regarding the nature of the underlying core, whereas the prediction at the trait level may be more mechanistic. This comes down to the quality of the theory one is using to make their predictions. Most personality psychology predictions are on the order of proximal and descriptive. That is, researchers assemble correlates from other studies to build the case that their two pet variables will be linked. We urge caution here in taking an exploratory approach to examine the subfactors. In contrast, if one has a strong theoretical paradigm (e.g., evolutionary psychology), one can make more sensible predictions but those predictions may not be able to focus on any one of the traits if we assume the traits (or at least their measures) are imperfect themselves. Whether the Dark Triad is treated as a single construct, a three-factor construct, or even a construct with more than three factors, should depend on the situation. Ultimately, it is up to the researcher – guided by theory – to determine the best approach to use for her/his project.

The approaches used to study and understand the Dark Triad vary considerably within the literature. This variation stems from disagreements over what the Dark Triad is, how it should be measured, and most importantly, how we can better understand it in future research. What should be clear here is that the factors within the Dark Triad are conceptually important and distinct components, and that blindly forcing them into a single construct in every situation, regardless of their differences, loses an important part of their utility. Likewise, forgetting their similarities and treating the factors as universally separate and isolated concepts can be just as bad. While there is no clean answer to these problems, future research might provide some answers, however, long this might take. Until then, researchers are advised to carefully consider these points before they commit to any one approach.

Measurement and Theoretical Issues with the Dark Triad

Arguably, the first task to making any serious advances in any science is having standard metrics. Doing so allows researchers to all 'speak the same language.' Unfortunately, personality psychology tends to resist this trend with most personality constructs having multiple measures. The Dark Triad is no exception. There are various measures of all three traits. Early work relied mostly on the Narcissistic Personality Inventory, the Self-Report Psychopathy Scale-III, and the MACH-IV. However, in hopes of reducing subject fatigue, standardizing a single Dark Triad measure, reducing bloated specificity, and reducing contamination from related constructs the *Dirty Dozen* was created. However, as a brief measure (viz., 12 items) it cannot maintain the heterogeneity in the longer (i.e., 124 items) measures as has been noted by the scale authors and its

critics. Nevertheless, it remains the most well-validated, short, published, brief instrument to assess the Dark Triad. Despite its brevity, it has proved its value in Classical Test Theory and Item Response Theory assessments, the three traits have different correlates, and the measures appear to cover the range of subtraits (e.g., primary psychopathy, vanity) each of the three constructs contains.

Putting issues of measurement aside, there are some major theoretical considerations. Up until about 2009, nearly all work on the Dark Triad was descriptive. This early work was focused more on accounting for the shared correlation among the Dark Triad. However, descriptive work is extremely limited although it is all-too-common in personality psychology. Thankfully, a number of authors have ventured into different theoretical paradigms to attempt to understand the nature of the Dark Triad. We briefly review some of them here.

A number of theories could be lumped into what we will call interactionist theories (e.g., nature and nurture). Evidence suggests the Dark Triad traits are heritable with each having some degree of susceptibility to environmental contingencies – Machiavellianism, in particular. In addition, the Dark Triad has been linked with many evolutionarily important behaviors, such as a short-term mating style and a 'fast' life strategy leading some to examine the Dark Triad from an evolutionary perspective. But if these traits are heritable, how might we account for the continued persistence of the traits in the population?

Parasites and Hosts

Those high on the Dark Triad do appear to have an exploitive, parasitic, and opportunistic mating style. Might insights from germ theory provide a way to understand the Dark Triad? While reasoning from analogy can have its limitations, we contend that thinking of those high on the Dark Triad as 'parasites' and society as the 'host' may have some value. Parasites operate on different timelines. Genital herpes operates on a slow timeline. It infects the cells of the host and uses the host to increase its spread through infecting others, but little more than mild flu-like symptoms are observed before the first outbreak. In contrast, influenza operates on a faster timeline. It infects the host, quickly creating fever and even causing death. Simultaneously, the host has strategies to avoid infection and minimize its effects through the behavioral and biological immune system. If the Dark Triad is adaptive, those characterized by the traits need to strike a balance in the timeline of their infection and the strategies they use to promote their inclusive fitness and must 'trick' the host. Indeed, people have a heightened amygdala and orbital prefrontal cortex responses to faces of people who score high on a psychopathy measure and those high on the Dark Triad appear to have adaptive strategies to minimize detection. This suggests a coevolutionary arms race between the host and the parasite or the society and the person high on the Dark Triad.

Life History Theory

Research on the Dark Triad has exploded in the last 5 years. One reason for this has its integration within evolutionary psychology, in particular life history theory. From this perspective, personality traits are evolutionarily stable strategies designed by natural selection and shaped by environmental contingencies (e.g., harshness and instability in one's childhood) to enable reproductive fitness. Those high on the these traits might have a 'fast' life history strategy geared toward maximizing immediate returns over delayed outcomes as would be predicted by the tradeoffs expressed in life history theory as seen in future discounting, short-term/exploitive mating and social strategies, and impulsivity. The Dark Triad traits could be maintained in the population if some positive fitness benefit is accrued. What is often disparaged as a maladaptive personality can be conceptualized within life history theory as an adaptive stable strategy on a shorter time horizon.

Niche-Specialization Hypothesis

One of the limitations of evolutionary psychology is that it is too reliant on hypothesized ancestral conditions. As an alternative, one might use behavioral ecology to study within-species variation. In this case, we adopt reasoning by homology. That is, from what we know from primatology we can reason what the role of personality traits might be. Personality traits may drive individuals to select certain environments over others. In order to avoid predation, find food, increase mating success, primates adopt different niches to survive. This might allow for a pairing of trait and niche. That is, because the human socioecology is so varied, individuals can specialize in one or a set of environments to their own benefits. Indeed, those high on the Dark Triad appear to have a preference for the time of the day that would make it easiest for them to take advantages of others and to select friends who serve some function instead of just for enjoyment.

Social Exchange Theory

Social Exchange Theory proposes that behaviors can be thought of as the result of cost-benefit analyses by people attempting to interact with society and the environment. If a person believes that they are able to extract more of a reward through a behavior than they lose by performing it, then the person will perform the behavior. Conversely, when the person feels that the cost will outweigh the benefit, the behavior will not be performed. If someone does not value maintaining a relationship, or is distrustful and does not expect others to follow through with the reward, then the balance would be shifted toward anticipating a lower worth to any social exchange. That is, the relative costs would be higher, and the anticipated rewards would be lower. Such a mind-set could produce a short-term orientation favoring immediate, assured rewards, and would elicit the socially aversive behaviors characteristic of the Dark Triad. However, while we agree that there are costs and benefits, we are suspicious of apparent the Neo-Classical Economics assumption that humans are rational, calculating animals.

Overall

If we are to continue work on the Dark Triad, we need to keep in mind that it provides both benefits and deficits to individuals in terms of both resource and mate management.

An evolutionary approach can be used to understand not only why the Dark Triad exists, but under what circumstances it can be the most beneficial, and the most detrimental. Understanding what triggers the development of the Dark Triad would be an integral part of discovering how we can either prevent, treat, or utilize Dark Triad strategies. It might be that societal and occupational niches could be found for those high on the Dark Triad, and instead of simply trying to change these individuals to fit what we consider to be 'good,' we might find various roles for them to fill in society; much in the same way that we consider killers bad, and yet employ some people (i.e., army infantry) to go out and kill.

Limitations and Final Thoughts

Contemporary research on the Dark Triad comprises mainly self-report measures. While this is often considered standard in psychological research, it raises an interesting problem; in Dark Triad research, we ask naturally deceptive people to be honest about their personality. While every attempt is made to ensure participants feel confident that their responses will be anonymous, it is clear that there is no direct benefit from being truthful. With no direct benefit for their honesty, and a potential serious cost if anonymity is not held, it is hard to find a reason for someone high on the Dark Triad to actually be truthful. In addition, self-report measures are prone to any kind of deceptive behavior, including social desirability influences, self-delusion (e.g., a narcissist refusing to admit that they seek attention for whatever reason), and 'faking.' Nonetheless, studies have reliably found links between self-reported Dark Triad scores and external variables, indicating that the self-report measures are managing to tap the constructs they claim to.

Recently, literature has begun to push further outside social and behavioral correlates of the Dark Triad. For example, a number of studies now have linked psychopathy with various neurological factors. While this represents an important step forward, it is important not to get too far ahead of ourselves. The Dark Triad traits are not *real* constructs; they do not exist within the brain, and they are not neurological structures. The Dark Triad traits are descriptors for behavioral patterns, nothing more. While these behavioral patterns might be the result of specific changes within the brain, this certainly does not make them equivalent.

The dispositional approach itself is not immune to this gradual reification either. Any behavioral trait, no matter how reliably linked to other variables, is a descriptor. That is, all traits are abstract concepts that we use to categorize behavior. While this is useful to help predict behavior across situations and examine the relationships between behaviors, it will not, by itself, explain why the behavior occurs. Thus, while the dispositional perspective can provide important insight into behavior, it can never fully account for all aspects of it. One major problem, for example, is that even in a highly sophisticated trait, you can never use it to fully predict responses in every scenario. People with the same trait in the same environment could very well display different behavior.

The field of personality has come a long way since its inception. Most recently, research has focused on examining behavior in terms of traits, or behavioral descriptors, in which a person's general behavioral trends are summed up into a single constructs. However, preliminary approaches focused too heavily on 'normal' functioning and neglected the more socially aversive aspects of behavior. With the introduction of the Dark Triad, researchers finally had a tool to begin to examine the darker aspects of human personality.

Abstract

Charles Darwin (1809–82) became an evolutionist on the basis of biogeographical evidence. His theory of natural selection, based upon individualistic reproductive competition, explained evolution without recourse to teleology or the supernatural. He presented the basic arguments for evolution and natural selection in his book *On the Origin of Species*, published in 1859. He elaborated upon his ideas in a series of books that dealt with a remarkably wide range of evolutionary topics. Darwin was largely responsible for establishing the modern evolutionary point of view and initiating many lines of investigation that continue to the present day.

Darwin's Life

Charles Robert Darwin was born in Shrewsbury, England, on 12 February 1809. He died at Down, England, on 9 April 1882. His father, Robert Waring Darwin (1766–1844), was a prosperous physician. His mother, Susannah Wedgwood (1765–1817), was the daughter of the industrialist Josiah Wedgwood II (1769–1843). Although the young Darwin developed extracurricular interests in the natural sciences, he was considered a mediocre student. At the age of 16 he was sent to the Edinburgh University to study medicine. He interacted with scientists there and furthered his extracurricular interests in natural history. But he decided that he did not want to practice medicine and realized that inherited wealth would make it unnecessary to work for a living. However, his father insisted that he have a respectable profession, and it was decided that he would become a clergyman. In those days, the study of natural history was deemed a suitable activity for clergymen. He therefore enrolled at Cambridge University on 15 October 1827, and remained there until 1831. His academic performance there was respectable, though not outstanding. On the other hand, his scientific interests were encouraged by the faculty.

Darwin was preparing for some scientific travel when he was invited to join a naval surveying expedition on *HMS Beagle* as unofficial naturalist and gentlemanly companion to the captain of the ship. The *Beagle* left England on 27 December 1831, circumnavigated the globe, and returned on 2 October 1836. During the voyage, he made extensive collections of plants, animals, and other natural history specimens. But he was mainly interested in geology, partly as a result of reading *The Principles of Geology* (1830–1832) by Charles Lyell (1797–1875). In that work Lyell discussed the evolutionary ideas of Jean-Baptiste Lamarck (1744–1829) but Darwin did not become an evolutionist until after the voyage, nor did Lyell until many years later. It was Darwin's geological work, especially his theory of coral reefs, that first made him famous.

Early in 1837, expert opinion on his collections, especially those of the birds of the Galapagos Archipelago, convinced Darwin that evolution was a viable idea, and he set out to develop a theory. As part of this research program, Darwin read the *Essay on the Principle of Population* by the economist Thomas Robert Malthus (Malthus, 1826). This led Darwin to appreciate how the scarcity of resources affects reproductive competition, and, around 28 September 1838, he discovered the principle of natural selection. The properties of the most successful competitors are increasingly represented in successive generations, transforming their species.

Darwin married his cousin Emma Wedgwood on 29 January 1839; their first child was born on December 27 of that year. They set up their house in London, but his health began to deteriorate and he suffered from mysterious ailments for the rest of his life. In 1842, the family relocated to a country residence near Down, south of London. Nonetheless, Darwin was highly productive. A book on his voyage (Darwin, 1839) was a popular as well as a scientific success. He edited the zoology of the voyage and, in addition to minor papers, published three volumes on his geological research (Darwin, 1842, 1844, 1846). Development of his ideas on evolution continued, and he wrote a sketch of a book on it in 1842, and a draft in 1844.

In 1846, Darwin began some research on barnacles, which led him to spend 8 years revising the classification of that poorly understood group of marine animals and writing a vast taxonomic monograph (Darwin, 1851, 1854), which in effect was his first book on evolution. He then proceeded to work up his materials on evolution. A large book entitled *Natural Selection* was in the process of composition when, on 18 June 1858, a manuscript from Alfred Russel Wallace (1823–1913) arrived in which the same basic mechanism was proposed. A joint paper was read before the Linnean Society on July 1, and on July 20, Darwin began to write an 'abstract' that ultimately became the *Origin of Species* (Darwin, 1859). The first of six editions was published on 24 November 1859.

Darwin brought out a series of books that dealt with a broad range of evolutionary topics. These books all included results of his ongoing empirical research, much of it on the sexuality, physiology, and behavior of plants. A book on orchids (Darwin, 1862) was followed by one on climbing plants that first appeared as a journal article (Darwin, 1865). What had been a section of *Natural Selection* became *The Variation of Animals and Plants under Domestication* (Darwin, 1868). It was the second of what are considered Darwin's 'major' evolutionary works. The third was *The Descent of Man, and Selection in Relation to Sex* (Darwin, 1871). *The Expression of the Emotions in Man and Animals* (Darwin, 1872) was followed by a series of botanical works (Darwin, 1875, 1876, 1877a, 1877b, 1880). The last of his books dealt with earthworms, especially their

 http://dx.doi.org/10.1016/B978-0-08-097086-8.61021-8

behavior (Darwin, 1881). Darwin died at his home at Down on 19 April 1882. He was buried at Westminster Abbey on April 26.

Darwin's Scientific Contribution

Darwin brought about the most important revolution in the history of the human intellect. For that very reason, it has taken a long time for his ideas to become assimilated and the process is far from complete. Although he was able to convince the scientific community that evolution had in fact taken place, he was far less persuasive with respect to natural selection, which only became the majority view toward the middle of the twentieth century. Furthermore, evolution as Darwin and his successors have come to understand it was something quite different from the 'evolution' of his predecessors and many of his contemporaries. This is true of both evolution and its mechanisms.

Darwin's early geological research was crucial to his intellectual development. It gave him experience in thinking historically, dealing with real events that happened to concrete particular things. The fossil record, however, was still very poorly understood, and one of Darwin's major contributions was showing how incomplete it was. It was biogeography, not paleontology, that convinced Darwin that evolution had occurred and provided his most compelling arguments for it. But that required thinking about groups of organisms not only changing but also having common ancestors. Darwin's predecessor Lamarck (1744–1829) had published a branching diagram, but his basic conception was that of multiple origins of simple organisms by spontaneous generation, and their descendants becoming increasingly complex as independent lineages. It was a more historical version of the traditional idea of a *scala naturae*, with organisms ranked as higher or lower according to how closely they resembled human beings.

When Darwin's predecessors attempted to explain the transformation of species, they invoked the kinds of causation that they were familiar with in other areas of experience. Supernatural influences played a diversity of roles in such thinking, often important ones. Change in lineages was largely thought of in terms of analogies with the development of embryos. A kind of 'evolutionism' was possible in which simple organisms had been created, followed by a long succession of generations before the result that had been foreseen from the beginning – Man – was realized. Alternatively, the Creator had ordained laws of nature, such that matter would organize itself into increasingly complicated forms with Man, again, the preordained result. These unknown laws of nature were often conceptualized as similar to those that govern the formation of crystals.

In Darwin's theory, evolution was subject to the laws of nature, but there was no law or other cause that drove things in any particular direction. Organisms evolved the properties that they did because of historical contingencies, and Darwin's critics often equated such contingency with 'chance.' Attempting to find explanations for evolution in terms of 'law' rather than 'chance' has been a recurrent theme in efforts to find alternatives to Darwinism.

The term 'orthogenesis' is often applied to notions of evolution occurring along predetermined lines, especially when there is some sort of analogy with the formation of an embryo. Such quasievolutionary ideas began to receive attention from social scientists before the publication of the *Origin of Species* (Darwin, 1859). The stage theory of Auguste Comte (1798–1857), with its theological, metaphysical, and positivistic levels, is one important example. Closer to what we moderns think of as evolution was the philosophy of Herbert Spencer (1820–1903). Spencer analogized both biological and socioeconomic evolution with the embryology of Karl Ernst von Baer (1791–1876). In Spencer's 'synthetic philosophy,' the increasing specialization of the parts in developing organisms was analogized with the specialization and diversification that occurs in society.

The 'superorganism' view of social and biological evolution has been firmly rejected by Darwin's followers. However, a more limited form of 'holism' that affirms the reality and importance of supraorganismal groups has become increasingly popular in the philosophy of systematics. Ontologically, species and other taxonomic groups are now considered not to be classes but individuals in the broadest sense: particular, concrete things that have a definite position in space and time. Like individuals in the familiar sense of organisms, they can change indefinitely, they have no definitions, and there are no laws of nature for any one of them.

Species are now understood to be supraorganismal wholes that are held together by sex. Darwin, however, never had a satisfactory species concept. But he did emphasize the interaction between organisms and the reproductive competition among them as the fundamental cause of change. As he saw it, the competition for such resources as food is important only insofar as it affects reproductive success. The crucial role of sexual reproduction is underscored in Darwin's theory of sexual selection, a major topic in *The Descent of Man* (Darwin, 1871). The 'secondary' sexual characters, such as gaudy plumage in birds and the antlers of stags, were interpreted by Darwin as the result of purely reproductive competition, based upon monopolizing mates, and unrelated to survival or procreation pure and simple.

Misunderstandings about competition have always been a major impediment to the assimilation of Darwin's theory. In economics, competition is thought of as a market condition that is antithetical to monopoly. The lay person, however, tends to confuse competition with other phenomena, such as physical combat, and to treat it as if it were the opposite of cooperation. For many, even teachers who grade on a curve, competition is something antisocial, if not downright immoral. Of course, political considerations have added to the confusion but it also reflects a deeper, metaphysical problem. The pre-Darwinian mentality had generally tended to assume that the world was created by God and that, in the words of Alexander Pope, 'Whatever is, is right.' Short of rejecting the basic premise, there are two popular alternatives. One is to endorse the conditions that exist. The other is to deny their existence. Various forms of social Darwinism have opted for the former. More tender-minded social thinkers, from Prince Kropotkin to Stephen Jay Gould, have opted for the latter, portraying the natural economy as one in which competition is unimportant. Darwin of course rejected the basic premise.

This perhaps bothered his contemporaries more than any other aspect of his theory. It allowed the phenomena of life to be explained in purely natural science terms, without recourse to teleology in any but a trivial sense. Everything came into existence as a matter of historical contingency in the course of a vast sex contest.

Partly because of his experience with barnacles, Darwin became increasingly aware of the importance and pervasiveness of sex. The barnacles, although generally hermaphroditic, turned out to cross-fertilize. Turning his attention to plants, Darwin found that they cross-fertilize far more often than anybody had realized. Indeed, there were widespread adaptations furthering outcrossing. He undertook extensive empirical investigations, with striking results that revolutionized floral biology. His first book after the *Origin of Species* (Darwin, 1862) dealt with the pollination biology of orchids. It documented in great detail the often complex adaptations that enabled the orchids to have insects transfer pollen from one flower to another. These adaptations were often quite bizarre and the book can at least be read as a sort of satire on traditional natural theology. It also counteracted the morphological tradition that had tended to dismiss function. The book evoked a debate between Darwin and his supporter the Harvard botanist Asa Gray (1810–88). Darwin firmly resisted Gray's efforts to find God superintending the overall trend of evolution. In the orchid book and other botanical publications, Darwin showed that inbreeding could be highly deleterious and that plants have both anatomical and physiological adaptations that further outcrossing.

In *The Descent of Man, and Selection in Relation to Sex* (Darwin, 1871), Darwin laid the foundation for a great deal of work on the comparative biology of reproduction. His theory of sexual selection followed from his basic idea that evolution results from reproductive competition between individuals. He interpreted such features as the antlers of stags and gaudy plumage in male birds as adaptations used in monopolizing mates, and not as contributing to survival or otherwise giving an advantage in competing with organisms of other species.

Individualistic competition also has a great deal to do with another important topic in that book: the evolution of morals. Darwin was quite clear on the point that organisms generally act in their own interest. He even suggested that an adaptation in one species that existed solely for the good of another species could not be explained in terms of his theory. He likewise ruled out adaptations that would benefit a species as such. There was as he saw it no good evidence that such adaptations exist. However, he still had to account for the existence of self-sacrifice upon the part of social organisms, including apparently altruistic acts by human beings. His discussions of such topics include basically everything that was considered by late-twentieth-century sociobiologists but without the genetics. He seems to have understood kin selection, insofar as he pointed out that in artificial selection traits could be favored by what Darwin called 'breeding from the same stock.' A relative of an animal with a trait such as flavorful meat could be selected for breeding instead of that particular animal. He seems not to have considered kin selection very important, however. Neither did he emphasize reciprocity, though he recognized its existence. Rather, he stressed familial selection, which was important in his treatment of the neuter casts of social insects such as ants and termites. He treated families as individuals, with the relevant competition going on between nests of ants or hives of bees. In dealing with human morality, Darwin invoked selection at the level of the tribe or nation. His reasons for invoking such group selection, rather than, say, reciprocity, are not explicitly stated in his writings.

To what extent did Darwin go along with the 'social Darwinism' of his times? This term is by no means monolithic and merely saying that he endorsed some of it hardly answers the question. Social Darwinism was basically a political doctrine and it generally had a basis that was if not religious, at least teleological. Interfering with the struggle for existence would tend to prevent the desirable end result from happening. It would be like interfering with the growth and maturation of an organism. Darwin did not endorse such claims. However, he did maintain that free competition favored both biological and economic progress, the two being interrelated insofar as the human intellect is a source of innovation. Lessening the struggle would, he thought, tend to be dysgenic.

There was also a psychological aspect to Darwin's thinking about morals, one that often focused upon the 'moral sentiments,' as Adam Smith had called them. He tried to derive those sentiments from a feeling of sympathy. He considered morality highly serviceable in the struggle for existence, but the selective context was crucial. He suggested that in bees, in which the drones are killed by the workers, it would be appropriate for such fratricide to be a matter of conscience. Some of his readers were scandalized. Selection favoring instinctive behavior was important here, and it contrasts with much of the thinking of his contemporaries. Herbert Spencer had attributed moral sentiments to a more Lamarckian mechanism. There was a kind of racial memory of the sufferings of our ancestors. The British empiricist tradition had sought to explain ethics in terms of personal experience. Spencer made it racial experience. Darwin replaced experience with reproductive success.

The Descent of Man, and Selection in Relation to Sex (Darwin, 1871) was followed by its sequel, *The Expression of the Emotions in Man and Animals* (Darwin, 1872), which further elaborated upon Darwin's evolutionary psychology. Darwin rejected mind–body dualism and thought that the functioning of the nervous system and the rest of the body were very tightly linked. He used facial expression and other body movements as a means of gaining access to the inner workings of the nervous system. It also provided examples of evolutionary continuity. As he saw it, emotional expressions might come to function in communication, but in keeping with his general antiteleological position they did not originate that way. Rather, they could be traced back to historical antecedents having a different functional significance. Darwin's interest in psychology can be traced back to his undergraduate years and was a major topic for his empirical research. Two features of this work need to be stressed at the outset. First, although he owed much to the extensive literature on such topics, with which he was quite familiar, much of his contribution came from rejecting the assumptions that had often been made. For example, he rejected the (teleological) notion of Charles Bell that there are anatomical adaptations for expressing emotions. Second,

his work in that area rested upon a solid basis in experience, including laboratory experiments as well as natural history observations, with much attention paid to the underlying physiological mechanisms, this at a time when psychology was just beginning to disassociate itself from philosophy and become a laboratory science.

Much of Darwin's behavioral research was done on plants. One naturally hesitates to call such work 'ethology' or 'physiological psychology,' but the lack of muscles and nerves in plants does not prevent them from moving and responding to stimuli. Bridging the gap between plants and animals was part of Darwin's effort to overturn traditional metaphysics. The book on insectivorous plants does more than just allude to that point. In his work on climbing plants Darwin found a morphological continuity between the organs used in climbing and less modified precursors. Tendrils were the modified petioles of leaves, for example. He also found that he could trace the circling movements with which the plants located objects upon which they climbed to a circling movement that had no such function. That led him to investigate the manner in which plants respond to directional stimuli. His research on that topic was first-rate plant physiology and gave rise to a vast literature. His follower George John Romanes (1848–94) extended that sort of reasoning to simple marine animals and thereby founded an important tradition in the study of animal behavior.

Darwin also concerned himself with the ontogeny of behavior, especially that of human beings. He kept detailed notes on the behavioral maturation of his own children. Some of this material was incorporated in *The Expression of the Emotions in Man and Animals* (Darwin, 1872). A paper containing excerpts from the notes (Darwin, 1877a) is considered one of the classics of child psychology. Darwin had several reasons for studying behavioral ontogeny. Not the least is the light it may cast on the role of inheritance versus learning. If there has been no opportunity for learning, and behavior appears spontaneously in the course of maturation, then a strong case can be made for inheritance.

Another reason for studying the ontogeny of behavior was Darwin's basic position on the relation between development and evolution in general. For him, the modification of ontogeny was a fundamental evolutionary process, and he routinely approached evolutionary problems from the point of view of embryology. Darwin believed that the processes responsible for the development of a fertilized egg into an adult are things that themselves evolve. This belief was in itself an important innovation. Perhaps more importantly, he showed how natural selection could modify the structure and function of organisms by affecting the various stages of development. By implication, the history of life could be approached by asking how the underlying developmental processes had been modified. His great follower Fritz Müller (1821–97) developed Darwin's approach by suggesting that the history of certain crustaceans could be interpreted as the result of stages being added at the end of the life cycle. As a consequence, the most modified animals would repeat, during their life cycles, the series of adult ancestors. Another of Darwin's followers, Ernst Haeckel (1834–1919), took Müller's special case and treated it as the general rule, and enunciated what he called the fundamental biogenetic law, according to which ontogeny recapitulates phylogeny.

Darwin's views on the relationship between development and evolution are discussed at length in *The Variation of Animals and Plants under Domestication* (Darwin, 1868). The variations that play an indispensable role in natural selection are here shown to occur in a more or less orderly fashion, evidently as a result of the modification of existing developmental mechanisms. Variation was thus physiologically constrained, and evolution by natural selection was by no means affected only by external conditions as is so often maintained in caricatures of Darwinism. Because this book contains toward its end an effort to explain heredity as well as development, the work is often misinterpreted as mainly about genetics. Darwin attempted to explain the inheritance of acquired characteristics (and much else as well) in terms of particles that control development. These particles could be affected in the somatic tissues, not just the germ tissues. The particles interested some of Darwin's followers and, with considerable modification in the hands of Hugo De Vries and others, they evolved into the 'genes' of later authors.

Darwin's Relevance for Today

Darwin was a remarkably creative thinker, as attested by the surprise with which his discoveries were so often met. One reason for this was the sort of wide-ranging curiosity and erudition that has become increasingly difficult to emulate as knowledge becomes ever more specialized. He was a very good observer, but insisted (at least in private) that this was because his observations were guided by theory. On the other hand, he was also an empiricist, and did not sympathize with the 'deductive' approach as he called it of such authors as Herbert Spencer. He confronted his theories with a mass of evidence and modified them in the course of investigation.

Darwin was not constrained by academic fashion or pedantry in seeking material that could be put to scientific use. He unearthed a wealth of information in the writings of plant and animal breeders and appealed to gardeners and others to provide additional materials. He also carried out extensive series of observations and experiments, often opening up new areas for investigation. We should mention his studies of competition between plants as pioneering contributions to experimental ecology. Darwin's experimental work is highly regarded by plant physiologists and students of animal behavior. However, his originality so far as methodology is concerned has more to do with comparison than with experiment. In Darwin's hands, comparative biology became linked to the revolution in systematics, a discipline that was now based upon genealogical relationships and therefore fundamentally historical. Hypotheses could be developed and tested by such procedures as plotting data onto a phylogenetic tree. Phylogeny was especially important with respect to adaptation, which was now conceived of as the outcome of a historical process.

The shift to historical narrative is an aspect of the rejection of traditional, teleological modes of thinking in which states of adaptation had implied purposefulness, even conscious design. Although structures might give many of the appearances of having been constructed by an intelligent being, it was no longer legitimate to treat ours as the best of all possible worlds.

By taking a historical approach and understanding the actual processes and events that have brought about the present properties of organisms, we can avoid the teleology. Instead of asking what an organ is 'for,' we ask what has brought it into being. It then becomes apparent that the world abounds in maladaptations and historical vestiges.

Contrary to what has sometimes been maintained, natural selection is not capable of explaining just about any conceivable property of organisms. Indeed the mechanism places strong restrictions upon the actual course of evolutionary change. For that very reason, it provides a powerful tool for evaluating hypotheses, especially where adaptation is involved. There is nothing that might reasonably be considered analogous to foresight when evolution occurs by natural selection. Any 'preparation' for future conditions of existence has to be the result of coincidence, and populations remain adjusted to present circumstances, and organisms repeat that which furthered their ancestors' reproductive success.

Because natural selection depends upon individualistic competition, there are strong constraints upon the kind of adaptation that can occur above the level of the organism. As already mentioned, Darwin clearly recognized that the individuals that reproduce differentially can be families as well as organisms, and on that basis he was able to explain the evolution of neuter castes in social insects. How readily that can happen has been a serious topic of controversy ever since. Darwin did not believe that differential reproduction of species could produce adaptations that exist 'for the good of the species,' though the possibility has subsequently been taken seriously by some authors. 'Group selection' was widely invoked in the early twentieth century. A critical attitude toward it did not become common until the latter half of that century, when in fact there would seem to have been something of an overreaction. From the point of view of Darwin's contribution, however, what matters is not the ultimate answer that may emerge, but rather the manner of framing the question. One needs to ask precisely how the world is structured and how the components might interact, formulate explicit hypotheses, and then test them.

Such issues, of course, are particularly important in the study of social behavior. The modern discussion of what sociobiologists call 'altruism' is a continuation of Darwin's pioneering work in that area. It is important, however, to recognize that 'altruism' in this sense is a technical term without ethical connotations and means self-sacrifice pure and simple. But people habitually slip back into older ways of thinking and tend to attach value judgments to statements of fact on the assumption that what is 'natural' is therefore good. Even where the teleology is repudiated explicitly, it may persist in the form of implicit assumptions. It is clearly an overreaction, however, to reject the study of adaptation in favor of so-called proximate causes. 'Teleology' in the limited sense of homing behavior and the capacity for foresight and understanding on the part of human beings and some other animals is by no means inconsistent with the expectations of selection theory.

Darwin recognized that natural selection is capable of accounting for the phenomena of progress. He reasoned that in a competitive economy, innovations that are effective in dealing with the environment would tend to accumulate. On the other hand, he rejected the views of many of his predecessors and contemporaries whose conceptions of progress remained teleological. Notions about evolution, whether social, economic, or biological, based upon analogies with the growth of crystals or the development of embryos implied a kind of inevitability that was out of line with Darwin's theory. But they appealed to those who were looking for some kind of long-term goal to it all. Darwin witnessed a great deal of technological progress in his day, and like the overwhelming majority of scientists then and now, he obviously believed in scientific progress as well. Although the idea of progress has recently come under attack by philosophers and social scientists, this may just be another episode in the ongoing process of coming to grips with Darwin's contribution.

Darwinism

Abstract

Darwinism is the theory of evolution through natural selection as discussed by Charles Darwin in his *Origin of Species* (1859). Darwin himself established beyond doubt the fact of evolution, and although the mechanism, natural selection, was controversial for many years, now with the backing of modern genetics it is appreciated as the fundamental cause of evolutionary change. There are controversial extensions of Darwinism, especially into the realm of human behavior, and also fruitful new paths, especially in the field of medicine.

Darwinism is the term given to the theory of evolution that originates with the work of the Englishman Charles Robert Darwin (1809–82), particularly as expounded in his work *On the Origin of Species* (1859). It is the theory that claims that the truly significant cause of change is the 'natural selection' of some organisms over others: more organisms are born than can survive and reproduce, some have features that help them in the consequent 'struggle for existence,' and these are winnowed or selected to be the seed stock for all succeeding generations. There is change and the direction is toward 'adaptive' excellence, meaning by this that organisms have features (like the eye and the hand) that enable them to survive and reproduce. These conclusions apply to all organisms, including us humans, consequences that have had major implications for our subsequent thinking about science, philosophy, and also religion. This article discusses these and related claims, paying attention to the reception of Darwin's ideas at the hands of his supporters like Thomas Henry Huxley, and looking especially at those advances arising from the development in the twentieth century of theories of heredity, or genetics. Consideration is given to the students of social behavior, the sociobiologists, and attention is paid to the modern controversies around their claims. Also considered are the claims by the students of paleontology, the punctuated-equilibrium supporters, that the course of evolution is not smooth and gradual but marked by periods of inactivity (stasis), broken by rapid changes. Brief mention is also made of new extensions of Darwinism, particularly into the field of medicine.

'Darwinism' can properly be dated from 1859, the year in which English biologist Charles Robert Darwin (1809–82) published his magisterial evolutionary work, *On the Origin of Species by Means of Natural Selection* (*see* Evolution, History of). To understand the magnitude of what Darwin achieved in that work, and the nature of the movement to which he gave his name, it is perhaps best to recognize that three different kinds of issues are at stake here (Ayala, 1985). First, there is what one might speak of as the very fact of evolution itself: the claim that all organisms, living and dead, are the result of a developmental process governed by natural law. Then, second, is the question of *paths* of evolution, or, as these are known technically, of phylogenies. Here, one is concerned about the routes along which evolution proceeded. Third, there is the question of *causes* or mechanisms. The work of early nineteenth-century French biologist Jean Baptiste de Lamarck (1809), who argued that organisms change due to the inheritance of acquired characteristics, speaks to this particular issue. Here, one is concerned with the driving forces behind the evolutionary process.

Although Charles Darwin was not the first evolutionist – in the eighteenth century, at length in rhyming couplets, his own grandfather Erasmus Darwin had celebrated the joys of organic change – it was in the *Origin* that Darwin established once and for all the fact of evolution. He did this through making appeal to a unifying argument or what he would have thought of as a 'consilience' (Ruse, 1979). Darwin argued simply that if evolution was true, then one could explain facts in a wide range of areas. For instance, one can show why the fossil record is roughly progressive. Likewise, one can show why organisms are distributed as they are around the world. One can explain the facts of embryology, such as why organisms take very different forms when adult (like the human and the dog) but have embryos that are almost identical. Why is it that the facts of anatomy are as they are? Why do we find skeletal isomorphisms (known technically as 'homologies') between the forelimbs of organisms, despite these limbs having different functions? The bat uses its forelimb for flying, the mole for digging, the whale for swimming, and the human for grasping, yet the bones are very similar. One can explain this, argued Darwin, through the fact of evolution. All of these phenomena, and many more, can be explained by evolution. Conversely, they point backward up to the truth of the fact of evolution (Ruse, 2008).

In the *Origin*, Darwin had relatively little to say about the paths of evolution, although it was he who tied evolution firmly to the metaphor of the tree of life. Unlike some early evolutionists, Darwin always stressed the extent to which all life is related and descends 'from one or a few forms,' branching as time unfurls to the vast diversity that exists today. But, paradoxically, in the nineteenth century it was the non-evolutionists – particularly Lamarck's contemporary and fellow countryman Georges Cuvier, who was both the father of comparative anatomy and an accomplished paleontologist – who first started to work out the actual course of life's history (Ruse, 1996). In such labors, Cuvier was backed by German-style biologists – particularly the Swiss-American ichthyologist Louis Agassiz – who saw analogies between life's history and the development of individuals. Darwin himself relied both on the fossil evidence

and on embryology and its supposed analogies when, around 1850, he performed a massive taxonomic study of barnacles. It is clear that although he did not draw explicit inferences about evolutionary paths, he had some strong convictions and suspicions (Richmond, 1988). But none of these found their ways into the *Origin*, and later in the nineteenth century it was Darwin's young supporters like Thomas Henry Huxley who were most interested in particular paths. In the United States, there was much activity in this direction, thanks particularly to the magnificent fossil findings, especially those of the horse and of dinosaurs (Bowler, 1996).

Natural Selection

It was when it came to causes or mechanisms that Darwin himself felt that he really was able to make significant scientific advances. He proposed his well-known mechanism of evolution through natural selection brought on by a struggle for existence, starting from the claims made by the English clergyman Thomas Robert Malthus (1826) that population numbers will always outstrip food supplies and space availability. Generalizing this to the animal and plant world, Darwin suggested that there will always be, at the same time, naturally occurring variation within populations: his studies of barnacles convinced him strongly that this was true. Darwin therefore concluded that in the struggle, success would be at least in part a function of the differences occurring naturally within organisms. There will thus be a natural form of selection, corresponding to the artificial selection practiced so successfully by animal and plant breeders in the first part of the nineteenth century in the United Kingdom.

But, more than just this, Darwin believed that natural selection would lead to change of a particular kind (i.e., toward adaptive advantage). Darwin had read and been much impressed by the teleological arguments expressed by Archdeacon William Paley (1802/1819), a work that Darwin had to read as an undergraduate. Paley argued that the eye is very much like a telescope, and that just as a telescope has a telescope maker, so the eye has an eye maker – that is to say, the Great Optician in the Sky. Darwin rejected Paley's conclusions, but he completely accepted Paley's premises about the design-like, teleological nature of the organic world. It was Darwin's belief that natural selection speaks to this aspect of organic life, providing a naturalistic – that is to say, law-bound – mechanism of explanation (Ruse, 2003).

Huxley's Program

After the *Origin* was published, evolution as fact was never again seriously challenged as a matter of science. But the mechanism of which Darwin was so proud got relatively little attention. Darwin's great supporters, Huxley particularly, had other ends for evolution than a functioning professional science with selection at its core (which had surely been Charles Darwin's own aim). Huxley and his fellows were busy creating a secular society in Victorian times: one that would have open education for all without religious qualifications, and one that would have a professionally trained civil service, not to mention other things like a military in which one's rank did not simply depend on one's social status and personal wealth. With some good reason, the Huxleyites saw the established church as being very much part and parcel of the powers that they wished to overthrow. Hence, they were eager to find some alternative secular substitute (Ruse, 1996, 2005).

Evolution fitted this need entirely. It was not so much that evolution was being pushed as something in direct violation of Genesis or anything like that. Rather, evolution could function as a kind of secular religion or ideology, on which one could hang all sorts of hopes of progress, ethical change, and the like. It is no surprise to find that, as the nineteenth century drew to an end, the evolutionist *par excellence* was less Charles Darwin and more his fellow countryman Herbert Spencer (Richards, 1987). The latter, in his massively written 'Synthetic Philosophy,' was providing a world picture that would be all encompassing, right up to and including our own species. Naturally, as a prospective religion, evolution was used to promote moral and social causes. Notoriously, Spencer and his supporters – prominent in this respect were the American businessmen John D. Rockefeller Sr. and Andrew Carnegie – endorsed a kind of *laissez-faire*, arguing that as with the struggle for existence, survival, and selection in nature, so also should there be such a struggle and selection in society. It is paradoxical that this movement became known as social Darwinism, for although there are certainly hints of such ideas in Darwin's own writings (especially in his work on our species, *The Descent of Man*, 1871), primarily this was a movement to which he contributed little and that altogether took evolutionism in directions he rather regretted.

The Synthetic Theory

Darwin's ideas as science provided only part of the picture. The whole question of mechanisms was rather delayed until the twentieth century. Then came the development of an adequate theory of heredity explaining how and why it is that organic characteristics are transmitted from one generation to another, and why new variations appear occasionally, spontaneously as it were. When this was first done, many thought that the new theory of heredity, genetics, was in opposition to any kind of selection mechanism. But by the 1930s, a number of mathematically gifted biologists – notably R.A. Fisher (1930) and J.B.S. Haldane (1932) in the United Kingdom and Sewall Wright (1931, 1932) in the United States – showed that one can put together Darwinian selection with Mendelian genetics in a smooth synthesis (Provine, 1971; Ruse, 2013). Finally, an adequate mechanism for the evolutionary process was developed and accepted. However, much more work needed to be done. It fell to the next generation of evolutionists, notably people like Julian Huxley (1942) (the grandson of Thomas Henry Huxley) in the United Kingdom and the Russian-born American geneticist Theodosius Dobzhansky (1937), and his associates, to put the empirical flesh on the mathematical skeletons of the 'population geneticists.' Thus, around 1950, a full theory, which came to be known as the 'synthetic theory of evolution' or 'Neo-Darwinism,' had been developed: Darwin's theory of natural selection spliced in with Mendelian genetics, offering the way forward for

a full and satisfying causal picture of evolutionary change (*see* Microevolution).

Sociobiology

The years since around 1950 have been among the most exciting in evolution's history. Although no one now wants to challenge the ultimate picture, there have been both extensions and challenges. Most notably, the former has involved the pushing of a Darwinian selective approach into the realm of social behavior. Darwin himself always thought that such behavior was part and parcel of the evolutionary picture, but he recognized that it was extremely difficult to study. However, by the 1960s evolutionists felt sufficiently confident to extend their work to such organisms as the Hymenoptera (ants, bees, and wasps) as well as to mammals, including our own species. This development of the evolution of social behavior from a Darwinian perspective – so-called sociobiology – has been highly controversial (*see* Microevolution). The leaders in the field, people like William Hamilton (1964) and John Maynard Smith (1982) in the United Kingdom and Edward O. Wilson (1975) in the United States, not to mention the great popularizer Richard Dawkins, author of *The Selfish Gene* (1989), have been subject to a great deal of critical attention (Ruse, 1985). But now I think it is generally realized that one can profitably take a Darwinian selection-based approach into the social realm, dissecting and showing in great detail how the behavior of organisms is just as much a function of their evolutionary past as is their physical nature.

Still highly controversial has been some of the work by human sociobiologists that tries to take a selection-based approach to human nature and behavior (Ruse, 2012). By way of example, one might mention the Canadian researchers Martin Daly and Margo Wilson (1988). They show that, in many respects, family patterns are tightly controlled by evolutionary considerations. Why is it, for instance, that violence in families almost always comes from the hands of men: usually not by biological fathers, but by stepfathers? Remarkably, Daly and Wilson show that stepfathers are 100 times more likely to murder their children than are biological fathers. This they relate to straightforward Darwinian principles, namely, that from a biological point of view, survival and reproduction may be improved if one can clear the way (as it were) for one's own offspring, but that damaging or harming one's own biological offspring is to go completely against the whole Darwinian evolutionary process (*see* Kin Selection).

Critics of Adaptation

On the other side, there are the critics of adaptationism. The most notable is probably the American paleontologist Stephen Jay Gould, who, like Richard Dawkins, was a very popular writer. Gould put forward his theory of so-called punctuated equilibria, arguing that if we look at evolution over long time scales, we see that selection as a force for constant, unbroken change falls away dramatically (Eldredge and Gould, 1972; Gould, 1982). Rather, what we get are long periods of inactivity (so-called stasis) broken or punctuated by very rapid changes from one form or blueprint (Gould likes the German term *Bauplan*) to another. Gould argues that although selection certainly improves organic characteristics, 'tuning them up' as it were, by and large the basic patterns of organisms are part of a general, morphologically constrained, nonselective picture. A vertebrate having four limbs, for instance, rather than six like many invertebrates, has nothing whatsoever to do with natural selection (Sepkoski and Ruse, 2009).

There are many other developments going on, particularly those involving molecular biology. For instance, it is suggested that perhaps at the molecular level, beneath the level at which selection operates, one gets a whole different dimension to evolution: perhaps a dimension where random factors are very significant (this is the theory of 'molecular drift,' Kimura, 1983). In other spheres, it has been documented that viruses can carry units of heredity ('genes') from one organism to another of a very different kind, in what is known as 'horizontal gene transfer' (Doolittle, 1999). Also, there is much work going on at the moment of related questions such as the origin of life. Certainly, no one has a firm solution in this direction, although once again major advances have been made and we know a great deal more than we did in the past (Ruse and Travis, 2009).

Evolutionary Medicine

As Thomas Kuhn (1962) taught us all, one of the marks of a really good area of science ('paradigm') is the extent to which it shows new fields and opens new topics for discussion. This is very true of Darwinism. Thomas Henry Huxley, who was trained as a medical doctor, could see little real applicability to Darwinism; for him, it was always more of a metaphysical approach. Although he was much interested in the reformation of medical education, Darwinism had no role in it. Today, thanks to pioneering work by the evolutionist George C. Williams and the psychiatrist Randolph Nesse, it is realized how much Darwinism might be important in medicine (Nesse and Williams, 1994) (*see* Evolutionary Medicine). This is obvious when dealing with genetic diseases like sickle-cell anemia, where one needs an evolutionary understanding of how these gene-caused illnesses persist (in this case, because the genes confer protection against malaria). It is true also when dealing with the evolution of diseases themselves, for instance the evolution of bacteria in the face of new antibiotics. It is well known that within a year or two of a new medicine's use, the diseases being attacked will respond with new forms. An understanding of the mechanism of evolution can go far to aid in this problem, as does teaching practitioners about the most effective doses and so forth. And, as a third area where Darwinism is important, one might mention the effects of diseases themselves. Many infections bring on elevated temperatures, to which the usual advice is 'Take two aspirin, drink lots of fluids, and go to bed.' But is it the most sensible thing to take aspirin and thus reduce the body temperature? Could it be that the high temperatures are themselves part of (evolved) nature trying to fight the infections itself? Perhaps high temperatures have a purpose! These and other questions have been raised by Darwinian medicine, today one of the most

exciting and challenging areas of application of the theory of the *Origin* (Gluckman et al., 2009).

The Meanings of 'Darwinism'

So, in conclusion, trying to tie together strands from history and the present, how then are we to define and characterize 'Darwinism' or a 'Darwinian,' the latter meaning someone who accepts the doctrine? Darwinism certainly commits one unambiguously to the fact of evolution. The only people today who challenge this seriously are those driven by religious commitments, namely, the extreme Christian evangelicals known as 'fundamentalists' who find that evolution clashes with their prior commitments to the Bible (especially Genesis) taken literally (Johnson, 1991). There are some Darwinians who think that their position also requires belief in some kind of philosophical materialism, claiming that any kind of supernatural belief is false or impossible (Dennett, 1995). Today, the so-called New Atheists are at the head of this particular queue, as it is argued that religion is the source of all evil, and Darwinism is the all-effective cure (Dawkins, 2007; Hitchens, 2007). However, this is surely not a universal view, and there are many (and not all believers) who think that although evolution holds exclusively in the scientific realm, there may be more to life – certainly there may be more to the afterlife – than strict science allows (Ruse, 2001, 2010). Science answers many questions, but even Darwinism does not speak to everything! (This is a good thing. As philosophers like Karl Popper (1976) emphasized, a theory that explains everything is probably a theory that explains nothing.)

As far as evolution as a path is concerned, although it is true that one does not have to be a Darwinian to believe in a tree of life, it is still surely true that Darwinism itself commits one to some kind of tree of life (Ruse, 2013). But Darwinism does not specify the details as such. The much-debated question, for instance, as to whether birds are descended from dinosaurs or from reptiles that were not dinosaurs has no bearing on Darwinism as such. What about the above-mentioned speculations that life's history may have involved such things as the moving of genes from one group to another very different one through the agency of viruses and the like? Hence the tree of life might be a bit more netlike than one would have suspected (Doolittle, 1999). Certainly, this is something that was not envisioned by Darwin himself or indeed by many successors who would have called themselves Darwinians. But I doubt that there would be much concern or felt need to repudiate Darwinism. After all, things like this are more extensions than major denials of the traditional picture.

Evolution as cause is as always the crucial issue. Darwinism has and continues to make natural selection absolutely central. If one does not accept that natural selection is the major cause of evolutionary change and that adaptation is the defining characteristic of organisms, then one is no Darwinian. This applies to humans as well (Ruse, 2012). Interestingly, the very first speculations we have of Darwin about natural selection was a discussion about human evolution and how selection leads to bigger brains and greater intelligence. As far as other points are concerned, then perhaps as with paths there is more flexibility. Darwin himself always stressed that selection works for the benefit of the individual over the group. This is very much the stance of sociobiologists in the twenty-first century, and is indeed the basis of Dawkins's metaphor of the 'selfish gene.' But there have always been those who have yearnings toward a group-based form of selection – one of the first indeed was the codiscoverer of natural selection, Alfred Russel Wallace. Perhaps, therefore, with something like this there is room for difference within the fold (Sober and Wilson, 1997).

It was never the claim of Darwin or any subsequent Darwinian that natural selection is the only mechanism of evolutionary change (Ruse, 2006). Darwin himself accepted Lamarckism. This mechanism is today totally discredited, but there are other putative causes of change, and one can certainly allow them some force and still be a Darwinian. There are many debates about how much of an allowance one can give and still subscribe to Darwinism. To a certain extent, it all depends on how far one is modifying traditional views and how far one is standing outside of, or beyond, them. Controversial is the question of 'genetic drift,' the claim by Sewall Wright that evolution can go by chance, even when selection is operating (Coyne et al., 1997). Really strict ultra-Darwinians like Fisher would have very little tolerance for something like drift, thinking it unimportant at best. Others (including most of the American founders of the synthetic theory) found some drift to be quite compatible with their Darwinism. Kimura himself felt (perhaps with good reason) that he was a good Darwinian because he did not propose drift at the physical level but at the molecular level. Darwin himself had said nothing about molecules, and so in proposing molecular drift there was no reason to think that one was being non-Darwinian.

Social Darwinism

Finally, what about social Darwinism? Few want to use that label given its unfortunate connotations with such things as the ruthless business practices of the twentieth century. But still there is a thriving industry among those who want to derive more from evolutionism than mere science (Ruse, 1999, 2009). Julian Huxley (1927) was one person in the twentieth century who wanted his evolution to be the basis of a 'religion without revelation,' and more recently Edward O. Wilson (1998) is another. In one of his prize-winning books, *On Human Nature* (1978), Wilson is explicit in seeing evolution as more than mere science, as a 'myth,' which will absorb or push aside conventional religion:

> Make no mistake about the power of scientific materialism. It presents the human mind with an alternative mythology that until now has always, point for point in zones of conflict, defeated traditional religion. Its narrative form is the epic: the evolution of the universe from the big bang of 15 billion years ago through the origin of the elements and celestial bodies to the beginnings of life on earth.

And so on and so forth up to humans. Little wonder that 'Theology is not likely to survive as an independent intellectual discipline.'

Wilson even finds a place for an evolution-based morality – not the *laissez-faire* of yesterday but a call to biodiversity and species preservation, lest we humans decline and fall in a world impoverished of living nature.

It is certainly not necessary for a scientific Darwinian to be a social or philosophical Darwinian, but a remarkably large number are. The important conclusion is that, however defined, Darwinism has a rich tradition, and although it has never been without its critics, it continues in the twenty-first century as an important and ever developing testament to human reason and creativity.

Darwinism: Social

Alain Drouard, National Center for Scientific Research, Paris, France

Abstract

In the most general sense, social Darwinism refers to the transposition of Darwinian theories from nature to society. The expression appeared in Europe in the 1880s and later in Anglo-Saxon countries, and was first used by the opponents of these ideas, and particularly by critics of the philosophy of Herbert Spencer.

It is difficult to define social Darwinism. From a theoretical point of view, it is a postulate of an analogy between the laws of nature and the laws of society makes it likely to be confused with evolutionism. On the contrary, if one focuses on the practices and the policies, which it advocates, it is tempting to equate it with eugenics, whereas many eugenicists were not social Darwinists.

Social Darwinism has assumed different forms in different times and in different countries. Between 1850 and 1880, liberal social Darwinism held that 'the struggle for life' between individuals of the same species and 'the survival of the fittest' were the fundamental laws of society.

At the end of the nineteenth century appeared what could be called 'selectionist social Darwinism.' The struggle between nations and races replaces henceforth the struggle between individuals as the driving force of history. States need to intervene to counteract the deleterious effects of civilization.

Introduction

The term 'social Darwinism' was coined in Europe in the 1880s and spread rapidly to England and the United States. It negatively referred to the theories and doctrines deriving social laws from the laws of nature. The term was first used to criticize the Spencerian philosophy of 'the struggle for life' and 'the survival of the fittest' rather than Darwin's own theory of natural selection.

Emile Gautier (1880), a militant anarchist, explained that the law of natural selection does not apply to human societies. He described this extrapolation as 'social Darwinism' and contrasted it with true social Darwinism which for him implied reforming society:

> "Instead of the struggle for existence, help for existence; instead of man, humanity; instead of antagonistic interests, universal solidarity" and added that it would be necessary "to collectivize the means of production" but also "to individualize the means of pleasure".

Emile Laveleye (1885) argued in turn that the application of the 'Darwinian laws' to society would result in the destruction of all institutions.

How Can Social Darwinism Be Defined?

Whatever form it has taken, at different times and in different countries, social Darwinism has been characterized, as clearly shown by Hawkins (1997), by a number of assumptions and common proposals:

- The laws of nature apply to all living beings and thus to man living in society;
- These laws of nature are 'the survival of the fittest,' 'the struggle for life,' and 'the laws of heredity';
- Population growth puts pressure on resources, which leads to a struggle for existence of organisms;
- The physical and mental traits that provide an advantage in the struggle for existence can be propagated throughout the population via hereditary transmission;
- The cumulative effects of selection and hereditary transmission over time explain the emergence of new species and the elimination of others.

More precisely, we can distinguish between a broad and a narrow sense of social Darwinism. In a broad sense, that runs the risk of making it appear similar to evolutionism, social Darwinism includes all doctrines and theories that suppose an analogy between the laws of nature and the laws of society. In a narrow sense, it refers to practices and policies implemented with reference to the laws of nature. Social Darwinism thus intersects with eugenics, without merging with it in the sense that eugenicists have not all been 'social Darwinists' (Drouard, 1999).

In the second half of the nineteenth century, social Darwinism had a very real influence on European social sciences before declining at the beginning of the twentieth century, and then was discredited by the use made of it by the national-socialist ideology.

In recent decades, sociobiology has renewed debates over social Darwinism.

Was Darwin a Social Darwinist?

While social Darwinists use the term 'struggle' in the literal sense and make the survival of the fittest its legitimate sanction, Darwin pointed out that he used the term 'struggle for life' as a metaphor that included different levels of oppositions and dependencies. The word 'struggle,' borrowed from the geologist Lyell, means making efforts in difficult conditions and at the same time facing an opponent. In Darwin, the 'struggle for life' is not defined as a direct clash involving individuals but as a set of solidarity mechanisms and clashes precariously balanced, and taking into account the milieu in which individuals and species live and fight. Darwin only used the term 'survival of the fittest' as late as the fifth edition of *The Origin of Species*, to refer to the process of natural selection and not to the struggle for life. Then in *The Descent of Man* (1871)

 http://dx.doi.org/10.1016/B978-0-08-097086-8.32036-0

he derived the emergence of morality in humans from the social instincts of animals.

The moral sense – an extension of social instincts – leads men to feel sympathy for their fellow men and to act in solidarity for their good:

> The aid we feel impelled to give to the helpless is mainly an individual result of the instinct of sympathy which was originally acquired as part of the social instincts but subsequently rendered in the manner previously indicated, more tender and more widely diffused. Nor could we check our sympathy if so urged by hard reason without deterioration in the noblest part of our nature.

The development of social instincts goes hand in hand with that of civilization and it does not necessarily lead to the 'degeneration of civilized people':

> Although civilisation thus checks in many ways the action of natural selection, it apparently favours by means of improved food and the freedom from occasional hardships the better development of the body…

The same is true for intellectual abilities and moral qualities.

But, ambiguously enough, Darwin agreed to some extent with Galton's eugenic ideas and declared that the development of social instincts should not eliminate competition and the struggle for existence:

> … as Mr. Galton has remarked, if the prudent avoid marriage, whilst the reckless marry, the inferior members will tend to supplant the better members of society. Man like every other animal has no doubt advanced to his present high condition through a struggle for existence consequent of his rapid multiplication, and if he is to advance still higher he must remain subject to a severe struggle … There should be open competition for all men; and the most able should not be prevented by laws and customs from succeeding best and rearing the largest number of offspring.

Unity and Diversity of Social Darwinism

Social Darwinism can be defined as a Weltanschauung, i.e., a philosophy of history or a sociology, which not only postulates an analogy between the laws of nature and the laws of society but also affirms that the laws of nature are 'the survival of the fittest,' 'the struggle for life,' and the laws of heredity, and that there should be no opposition to this for the welfare of society.

At the risk of minimizing the great diversity of its forms, there is a consensus among historians to distinguish two major types of social Darwinism:

1. a liberal and individualistic social Darwinism, influential until the end of the nineteenth century, which sees the struggle between individuals as the fundamental law of society;
2. a selective and interventionist social Darwinism, which can be defined as a sociology of struggle, and which emphasizes the struggle between races. This type of social Darwinism overlaps to a certain extent with eugenics and racism.

Liberal Social Darwinism

The first social Darwinism, that of Herbert Spencer (1820–1903), appeared before Darwin's *The Origin of Species* and *The Descent of Man*. It can be defined as an evolutionist philosophy without any connection to biology. Spencer's concept of 'the survival of the fittest' combines natural selection and economic competition between individuals. It does not deal with struggles between groups and races.

While Spencer (1871) referred to population laws, he did not draw the same conclusions as Malthus: the survivors are those who are endowed with a capacity for self-preservation superior to those who cannot participate in life's banquet. Economic competition is thus part of the laws of nature and nothing should hamper them because the survival of the fittest is the only process capable of ensuring human progress.

Population growth not only stimulates competition but is also the driving force behind civilization:

> This constant increase of people beyond the means of subsistence causes, then, a never-ceasing requirement for skill, intelligence and self-control involves, therefore, a constant exercise of these and gradual growth of them.

Demographic pressure is destined to come to an end when its task has been carried out, bringing the process of civilization to its fulfillment. That was not the case in the last third of the nineteenth century.

Even if the changes in English society and increasing state intervention did not correspond to his expectations, Spencer wrote again about the notion of the survival of the fittest in *The Principles of Sociology*, published from 1876 to 1880. From then on he distinguished between two types of modern societies:

1. militant societies characterized by an increasing role of the state, a growing number of civil servants, and faith in authority; and
2. those he thought to be superior forms of society, characterized by the decline of the state and the blossoming of personal freedom through competition between individuals.

Spencer feared in fact that the British society – the model of an industrial society in his eyes – was regressing to the type of a militant society because of the increasing role of the state. He always remained convinced that social progress could only result from a decrease in the constraints placed on individuals.

Liberal and individualistic social Darwinism spread mainly through the Anglo-Saxon countries. In the United States, the economist William Graham Sumner (1840–1910), the major theoretician of this type of social Darwinism, explained that differences between individuals merely reflect natural inequalities: people are not equal in the natural state, and this should be taken into account.

There is an analogy between the natural selection of the fittest in the animal realm and that of the most talented

citizens. As in nature where the strongest win out over the weakest, in society the most talented and hardworking people win out over the lazy. Wealth is therefore the consecration of the successes of gifted people:

> Millionaires are a product of natural selection, acting on the whole body of men to pick out those who can meet the requirement of certain work to be done … It is because they are thus selected that wealth aggregates under their hands both their own and that entrusted to them … They may fairly be regarded as the natural agents of society for certain work… (1914)

Sumner was opposed to any type of state intervention, protectionism, or form of socialism whose goal is to relieve individuals of any society from the difficulties or hardships of the struggle for life and of competition.

This type of social Darwinism, which was very popular at the time when liberal ideas gained support in the Anglo-Saxon countries, proved less successful on the European continent. Opponents did not fail to underline the contradictions and weaknesses of liberal social Darwinism. In the 1890s, the sociologist Lester Ward explained that economic competition did not result in individual advancement, but in big new corporations whose power might need to be controlled, and he criticized the social Darwinists' "fundamental error" that "the favors of the world are distributed entirely according to merit." This first type of social Darwinism should be distinguished from that of the end of the nineteenth century, which is based on a sociology of struggle between groups, collectivities, and races, and calls for state intervention and the control of human procreation.

Selectionist Social Darwinism and Eugenics

Called initially 'sociology of struggle,' selectionist social Darwinism emphasizes the idea of a struggle between different species in nature, to then arrive at the idea of struggle between races.

One of the first theorists of this form of social Darwinism was Walter Bagehot (1826–77) in England. The 'national character' of a people resulted in his eyes from the selection process of the struggle for life, which opposes nations against each other. But if he considered the struggle between groups as the motor of history, Bagehot did not seek to justify an essential superiority of one race or nation over another.

He classified races and nations a posteriori into a hierarchy according to their success in the survival competition. The strongest nations in each historical period were considered to be best.

Other scientists – biologists or physiologists as well as physical-science specialists – did not hesitate to define an a priori hierarchy, whereby races were considered to inherently possess more or less remarkable basic qualities.

This school of thought was most influential in Germany. Its representatives were convinced of the existence of a natural hierarchy of races in which the Aryans were destined to prevail in the struggle for existence and to be dominant.

One of the most important biologists of the nineteenth century and one of the most committed supporters of Darwin, Ernst Haeckel (1834–1919), declared in *Natürliche Schöpfungsgeschichte* (1868), a book reprinted several times before World War I, that the struggle for life could be applied to humans:

> There is everywhere a *bellum omnium contra omnes*, ruthless and relentless in the highest degree. There is nowhere in nature, wherever you look, the idyllic country the poet speaks of… There are on the contrary struggles and a continuous effort to destroy one's neighbor and enemy. Passion and egoism, conscious and unconscious, are the driving forces of life everywhere. Man, in this regard, does not constitute an exception from the rest of the animal kingdom.

At the same period in Austria, Ludwig Gumplowicz (1893) developed the concept of race struggle: "Under the term race struggle we shall designate the struggles of the most varied and heterogeneous ethnic and social units, groups and communities. They are the essence of the historical process."

Karl Pearson was the major advocate for selectionist social Darwinism in the United Kingdom, a social Darwinism that merged with eugenics. He wrote:

> It is at the opposition of Darwinism and medical progress that eugenics seems to provide a key to this situation. As eugenicists we assert the right to live does not connote the right of each man to reproduce his kind. (1912)

Though he was a socialist, he was opposed to revolution and he was in favor of gradual reforms allowing society to be strengthened and to be able to face international competition. In his eyes, eugenics and socialism could be separated – natural selection must give way to artificial selection in order to prevent the unfit from replacing the fit.

At the end of the nineteenth century, this form of social Darwinism has been considered, especially in the United Kingdom and in the United States, as a eulogy of colonization and imperialism in that the strongest nations were supposed to be the fittest ones.

Selectionist social Darwinism also asserts that the natural selection process is flawed or that it no longer functions properly because of the progress of civilization.

This had already been the opinion of Clémence Royer, who introduced the work of Darwin into France and wrote in the preface to the first translation into English of *On the Origin of Species*:

> But also the law of natural selection, applied to humanity, surprisingly and painfully shows how false our political and civil laws as well as our religious morality have been so far. We thus have come to sacrifice what is very strong to what is weak, the good to the bad, the gifted mind and body to the puny and vicious. What is the result of this unintelligent protection granted exclusively to the weak, the sick, the incurable, the bad, and finally to all of the disgraced beings in nature? The problem is that the suffering they experience tends to perpetuate itself indefinitely; that evil increases steadily instead of decreasing, and is increasingly growing at the expense of good.

One can see from this how selectionist social Darwinism intersected with eugenics, which stresses the need to replace natural selection with social selection. It is often confused with

eugenics because of the similarities and converging views between the two streams of thought concerning both the postulate that races and individuals are unequal and the role of heredity.

Well before the eugenics of Galton, doctors had advocated the selection of progenitors to fight against degeneration. In the midnineteenth century, Proper Lucas (1808–85) defended the idea of the selection of progenitors and of the circumstances most favorable for good reproduction. He identified the people to be excluded: the sick 'whose duty it is to abstain': a moral duty which, in certain circumstances, should be a legal obligation.

Coined by Francis Galton, Charles Darwin's cousin, and derived from the Greek words *eu* meaning good and *genos* meaning stock or race, the term *eugenics* refers to "the science of improving stock, which is by no means confined to questions of judicious mating but which, especially in the case of man, takes cognizance of all influences that tend in however remote a degree to give to the more suitable races or strains of blood a better chance of prevailing speedily over the less suitable than they otherwise would have had" (Galton, 1883).

Above and beyond its utopian component manifested in projects for an ideal city-state, one can see in eugenics a "scientific ideology," as Georges Canguilhem defined it (1977), i.e., a discourse mixing and amalgamating proposals of heterogeneous nature, some of which are or claim to be scientific in that they pertain to the science of human heredity, and others which are arbitrary and unprovable value judgments on human groups, categorized and prioritized as 'inferior' or 'superior,' 'gifted,' 'degenerate,' 'retarded' or 'weak-minded.' Like all ideologies, eugenics provides an explanation of the state of modern society and in particular its tendency to 'degeneration' because of the suppression of the 'natural selection' process. But it also postulates society's 'regeneration' and, to this end, proposes remedies.

Thus an artificial selection, fully recognized, must be substituted for the failing natural selection. The means that are advocated either refer to 'negative' eugenics or to 'positive' eugenics. 'Negative' eugenics aims at preventing people with hereditary diseases and serious deformities from getting married, by resorting to means ranging from segregation to sterilization. 'Positive' eugenics aims at encouraging 'gifted' or 'strong' individuals – the carriers of favorable physical and intellectual characteristics – to reproduce themselves as much as possible.

Georges Vacher de Lapouge (1854–1936) first introduced into the French language the word *eugénique*, which is the French term for "eugenics," created by Galton in 1883. Before designating an applied science and a technique, the term appeared as an adjective ('eugenic races,' 'eugenic families') or as a name for individuals with above-average hereditary skills ('the eugenics'). He contrasted 'the eugenics' to 'the degenerates': "There are families of degenerates … In others, skills such as health, strength, and beauty come from birth … These are the eugenics, and eugenics is the boon of heredity as degeneration is its curse." (1888b)

Eugenics thus refers to a hereditary anthropotechny as opposed to Lamarckism. Indeed, Vacher de Lapouge stressed the hereditary character of inequality:

> Individuals are not only unequal but their inequality is hereditary, classes and nations and races are not only unequal but each of them cannot undergo absolute improvement and the elevation of the average is the consequence of the extermination of the worst elements, of the spread of the best elements, in a word, of unconscious or subconscious selection. Human evolution is the result of this inequality. (1888a)

While Vacher de Lapouge borrowed from Darwin's theory the concepts of selection and the struggle for existence, he freely interpreted them by incorporating them into his problematic of social selection based on a premendelien conception of the 'laws of heredity.'

He explained that in modern societies natural selection no longer played its role and had been replaced by what he called *social selections* leading to the eradication of the fittest and which he qualified as military, political, religious, moral, economical, professional, and urban selection. Consequently, an artificial selection must be substituted for it so as to prevent society and civilization from being weighed down by degenerate and inferior people. He therefore advocated *selectionism* as the only remedy for 'senile democracy' and combined it with socialism:

> Selectionism as a practical doctrine consists in correcting the adverse consequences of natural selection and multiplying types accepted as the most beautiful and the best. There are many analogies with socialism in its purpose which consists in correcting the natural consequences of economic development, according to a determined ideal of social perfection. (1899)

For humans, social selection overrides natural selection. But it is clear that social selections are going in the wrong direction as they lead to the disappearance of the best elements, 'the eugenics.' It is "the mechanism of decadence," a process of "regressive selection eliminating the upper elements."

The analysis of social selections leads "to the most absolutely pessimistic conclusions." However, the dysgenic development of modern societies is not a fatality and the slope of decadence can be stopped "only if a systematic selection is opposed to the destructive and unregulated selection that is putting humanity at risk" (Vacher de Lapouge, 1896).

Otto Ammon (1842–1916) was the main representative in Germany of the anthropological and selectionist school of thought of which Vacher de Lapouge was the leader in France. Like the biologists Ernst Haeckel and Heinrich Ziegler, theorists of German social Darwinism, Ammon criticized socialism in the name of Darwinism (1891). He proposed "to base the foundations of the social order on the natural sciences" (1895) and more specifically on Darwinism:

> It is a sublime feature of the new conception of nature established by Darwin that it is compatible with all dominating historical forces, both of the material and intellectual or religious orders.

In his major work Die Gesellschaftsordnung und ihre natürliche Grundlagen (1895), Ammon defined what he termed 'regressive selection' as resulting in a gradual decrease in 'Germanic elements' or 'Aryans' and therefore in

a 'brachycephalization' of the population. Vacher de Lapouge in *Les sélections sociales* also provided a pessimistic analysis of urban selection, the most dysgenic selection of all, since cities qualitatively depopulate the countryside and destroy the 'eugenic' elements that they attract.

Ammon referred to the work of Galton to argue that inequalities in mental abilities are hereditary. Talent and genius are hereditary, and the social order is there to ensure their perpetuation:

> "The most remarkable result of the evolution of social life" is none other than "the isolation of the privileged classes from the mass of the population".

He feared above all that the hereditarily superior elements would be corrupted by urban life, would no longer be able to reproduce, and would thus disappear after two or three generations.

However, he developed a less pessimistic vision than Vacher de Lapouge of the evolution of society, as he maintained that the prevailing social order expressed and reproduced the natural inequalities between people.

According to Ammon (1895), the social order is inherently unequal, and this inequality is in the order of things:

> The social order is based on inequality, and inequality is not something that can be suppressed: it is as inseparable from the human race as birth and death; it is as fixed as mathematical truths and as eternal as the laws which regulate the functioning of our solar system".

If, due to 'defects associated with an exclusively intellectual culture and a sedentary life' the superior classes are threatened with eradication for the benefit of the inferior classes, the latter can better themselves through education and food, thus contributing to the renewal of the superior classes: "The existence of social classes promotes the working of natural selection, and also restricts 'panmixia,' i.e., the pairing of individuals without preselection, and favors a much more frequent production of highly endowed individuals" (Ammon, 1895).

At the end of the nineteenth century, this form of social Darwinism has been considered, especially in the United Kingdom and in the United States, as a eulogy of colonization and imperialism in that the most powerful nations were supposed to be the fittest ones.

Social Darwinism Today

From the beginning of the twentieth century, social Darwinism has been the subject of harsh criticism; for example, by Novicow (1910), who did not hesitate to denounce "a completely false theory … My criticism tends only to demolish the proposition that collective homicide can result in the progress of mankind."

The decline of social Darwinism, which was already perceptible after World War I, has on the one hand been ascribed to the use that was made of it, especially to justify imperialism, and on the other hand to the atrocities committed by the Nazis in the name of eugenics (mass extermination, euthanasia).

Even if nowadays social Darwinism is not explicitly referred to any more, it is still part of the intellectual scene, as the rise of sociobiology has shown. The latter is a scientific discipline founded by the zoologist Edward O. Wilson, which gave rise to serious ideological controversies in the late 1970s and early 1980s. Wilson (1975) defined it as "the systematic study of the biological basis of all social behavior."

The biological basis is provided by the modern theory of evolution as it has developed from Darwin's work and from contemporary genetics. Social behavior is the result of evolution – it has been selected and is therefore determined. In a sense, sociobiology is a form of biological determinism without being a form of reductionism at the same time, since Wilson contends that humans are the product of the joint influences of heredity and of the environment. To Wilson *biological* only meant that there are genetic predispositions contributing to the shaping of social behavior. To his opponents *biological* meant that social behavior was *biologically determined*. In the wake of the question of animal social instincts dealt with by Darwin in *The Descent of Man*, sociobiology strove to shed new light on the problem of altruism.

In his book *The Selfish Gene* (1976), Richard Dawkins, another representative of this school of thought, asks questions: "While natural selection is a selfish process which endows certain individuals with a superior capacity of reproduction, how can one explain the kind of altruism which is seen among social insects, and how can natural selection favor deeds harmful to those who do them?"

The answer given by sociobiology is that altruistic deeds toward relatives could favor the survival and the dissemination of the altruists' genes, which the parents have in common with them. In the same way, the mother instinct and the care given to the child are explained by social biologists as being the best possible way of arranging gene transmission from one generation to the other.

Abstract

In this article, we discuss secondary data sets in the applied social and behavioral sciences. First, we provide an overview of the history of secondary data sets. Second, we discuss the wide availability of secondary data sets, including efforts to archive data sets and make them more available to researchers and easier to use. Third, we highlight the benefits of using secondary data sets for applied research. Finally, we provide an overview of eight secondary data sets that we believe have been the most influential in the applied social and behavioral sciences.

Introduction

Secondary data analysis has achieved a prominent place in the applied social and behavioral sciences. *Primary data* are data that were collected by a researcher or team of researchers for the specific study or analysis under consideration. In contrast, *secondary data* are data that were not collected for a specific study or analysis but were collected for the explicit purpose of being analyzed by other researchers. Secondary data sets are usually sponsored by federal agencies or other organizations and often designed to address a broad set of research objectives or questions of interest to the sponsors. Many of the sponsors lack the capability to analyze the data they collect and spend considerable resources on training and funding opportunities to encourage other researchers to use and publish from the data. Researchers can use secondary data sets to answer the research questions that fall within the scope of the secondary data sets or, given the breadth of information available in many secondary data sets, other research questions that sponsors had not considered. Secondary data also include data that were collected by researchers for their own analysis but are later made available to the public to replicate findings and test new theories.

The current popularity of secondary data sets can be explained by several factors, including limited resources for funding primary data collection, demand for scholarly productivity, and the availability of high-quality data sets. Several decades ago, most graduate students and faculty collected and analyzed their own data for a study. However, most graduate students and junior faculty today do not have the financial resources or the time to collect their own data for their dissertation or study. Second, the 'publish or perish' mentality of some universities makes secondary data sets an attractive resource for junior faculty because they can publish an article more quickly than if they had to collect their own data. Finally, there are a large number of high quality, nationally representative, longitudinal secondary data sets publically available that are funded by federal agencies including the U.S. Census Bureau, the Department of Education, the Bureau of Labor Statistics, and the Department of Health and Human Services, to name just a few. The sheer breadth and depth of information that is available in most of these large-scale secondary data sets dwarfs what any individual researcher could collect for a specific study. These nationally representative and longitudinal data sets lend themselves to answering current research questions and using cutting-edge methods demanded by high-quality scientific research. In addition, a large number of data sets originally collected as primary data sets are now made publically available to share outside of the team of researchers that originally collected them for their own use.

In this article, we discuss secondary data sets in the applied social and behavioral sciences. First, we provide a brief overview of the history of secondary data sets in the applied social and behavioral sciences. We show that several simultaneous projects sponsored by federal agencies during the 1960s and 1970s paved the way for the large number of high-quality secondary data sets available today. Second, we discuss the wide availability of secondary data sets, including efforts to archive data sets and make them more available to researchers and easier to use. Third, we highlight the benefits of using secondary data sets for applied research. Finally, we provide a brief overview of eight secondary data sets or federal survey programs that we believe have been the most influential in the applied social and behavioral sciences. These eight data sets highlight the many flavors of secondary data sets and represent a diverse array of substantive research areas, including but not limited to labor, education, marriage and family formation, and health.

History of Secondary Data Sets

The use of secondary data sets is widespread in disciplines such as economics and sociology and has been steadily increasing in psychology. However, the availability of a large number of high-quality secondary data sets is a relatively recent development. Several simultaneous developments in the 1960s and 1970s paved the way for many of the most widely used secondary data sets today. The 1960s saw an expansion of federal government funding of social programs and with this came surveys to monitor the effects of these economic and social investments. In the 1960s and 1970s, several federal agencies launched national studies that would produce the first secondary data sets. The earliest studies were the Occupational Changes in a Generation Surveys of 1962 and 1973 and

 http://dx.doi.org/10.1016/B978-0-08-097086-8.10536-7

national surveys of social mobility conducted as supplements to the March 1962 and March 1973 Current Population Surveys (CPS) of the U.S. Census. In the mid-to-late 1960s, one of the most influential federal survey programs – the National Longitudinal Surveys (NLS) of the Department of Labor – first interviewed four groups of young and old men and women to form the original NLS cohorts. These cohorts were selected because each faced important labor market decisions, which were of special concern to policy makers at the time. In 1968, the Office of Economic Opportunity of the Department of Commerce (now the U.S. Census Bureau) sponsored the first wave of the Panel Study of Income Dynamics (PSID) to assess Lyndon Johnson's War on Poverty. The study included a nationally representative sample of over 18 000 individuals living in 5000 families. The PSID is ongoing and is the world's longest running longitudinal study.

In the early 1970s, a number of additional federal survey programs were launched. In 1972, the Department of Education collected the first wave of data for the National Longitudinal Study of 1972 (NLS-72). Participants in the study were selected when they were seniors in high school in the spring of 1972. The data contain information from follow-up surveys in 1973, 1974, 1976, 1979, and 1986 as well as their high school records and postsecondary transcripts (collected in 1984). The NLS-72 is considered the 'grandmother' of the more than 30 surveys conducted by the National Center of Education Statistics in the nearly four decades since its inception. Just a few years later, the NLS launched the National Longitudinal Survey of Youth 1979 (NLSY79), which included a national sample of about 13 000 respondents aged 14–22 when they were first interviewed in 1979. These respondents were interviewed 24 more times with the latest wave in 2010.

Not all secondary data sets start out as major studies funded by federal agencies. Several of the most influential secondary data sets were originally intended to be primary data sets for use only by the researchers who originally collected them. Perhaps the best example of this is the Wisconsin Longitudinal Study (WLS). The WLS began in 1957 as a survey by education professor J. Kenneth Little at the University of Wisconsin (UW) designed to understand the educational plan of Wisconsin high school seniors. Rising demand for college education and concern over technological competition with the Soviet Union was a major concern in the 1950s. In 1962, sociology professor William H. Sewell learned that the surveys were stored in the basement of a UW administrative building. Sewell resurrected the surveys and selected a sample of one-third or 10 317 for further study. The sample has been followed since. The WLS, which started out as a primary data set on high school seniors' college plans, became one of the most prominent secondary data sets used to study health and aging in the United States.

Availability of Secondary Data Sets

Most secondary data sets are funded by federal agencies. These federal agencies contract with private survey research organizations (such as Westat or Research Triangle Institution) or university survey researcher centers (such as the University of Michigan's Survey Research Center or the National Opinion Research Center at the University of Chicago) to assist in the design, collection, cleaning, and preliminary analysis of the data. As each wave of data is collected, it is made available by the contractor to the public. Most often, the contractors maintain Web sites where users can download the data. Many of these Web sites allow users to download the entire data set and, in cases of very large data sets consisting of multiple files, include tools that enable users to select specific cohorts and variables for download. Downloads usually include SAS, SPSS, or STATA code for extracting the data and producing a readable file. Users can save 'tagsets' of variables for download at a later time or for adding variables at a later time or that can be accessed by other members of the research team. Many Web sites also include custom analysis tools that allow users to run their own simple analyses for exploring the data, including means, tabulations, and cross-tabulations. Most of the Web sites also include data documentation, including technical documentation on sampling, copies of the questionnaires, and instructions for analyzing the data, including use of weights and appropriate methods for calculating standard errors in the presence of complex survey design. Technical support is also usually available from the contractor through e-mail or telephone.

The federal government, universities, and private organizations are increasingly taking steps to meet the very real demand for access to high-quality social science data for research. In 2009, the federal government launched data.gov, a Web site that is designed to provide public access to all of the publically available data collected by the federal government. Users can search over 85 000 secondary data sets by topic area or keyword. The Web site provides access to all of the influential secondary data sets collected by federal agencies through external links to the agency Web sites to download the data. The data.gov Web site also includes access to a wealth of data from evaluations and other studies conducted by contractors.

Perhaps, one of the best known efforts to provide easy access to secondary data is the Inter-university Consortium for Political and Social Research (ICPSR) at the University of Michigan. ICPSR is a leader in providing storage of and access to secondary data sets, training in secondary data sets, and education in cutting-edge methods for analysis of secondary data sets. ICPSR hosts 16 specialized collections of data on topics such as education, aging, criminal justice, substance abuse, among others, and archives over 500 000 files related to secondary data sets. ICPSR is well known for its Summer Program in Quantitative Methods of Social Research, available to students and faculty, which includes courses in research design, statistics, and data analysis. Another well-known source of secondary data is the Murray Research Archive at Harvard University, a multidisciplinary secondary data archive. Founded in 1976 with a grant from the Ford Foundation, the Murray Center focuses on acquiring data from studies that emphasize the entire life course. The collection currently contains data from over 52 000 studies available with a user agreement. The Murray Center plays a key role in making primary data available as secondary data to other researchers.

The private sector has also realized the demand for secondary data sets that are easy to use. The newest player in this arena is Sociometrics, a for-profit research and

development firm specializing in making secondary data sets easier for researchers to access. Sociometrics has compiled secondary data sets, documentation, and technical support into one place for researchers to access. The company's signature product is the Social Science Electronic Data Library (SSEDL), which contains nine archives with over 680 data sets from 285 studies available to researchers. Sociometrics offers subscriptions to the data archive that provide unlimited access to all data downloads, supporting documentation, and technical assistance.

There are rich funding opportunities available for researchers who use specific secondary data sets. Many of the federal agencies and organizations that collect secondary data have neither the capacity to nor interest in analyzing them. As such, they seek to encourage other researchers to use the data as much as possible through funding training and workshops and calls for proposals that encourage or even require the use of specific secondary data sets. For example, with funding from the National Science Foundation, the American Educational Research Association (AREA) provides small grants and training for researchers to conduct education policy and practice studies using many of large-scale secondary data sets sponsored by the Department of Education and other federal agencies. The Department of Justice, which funds the criminal behavior questions in the National Longitudinal Survey of Youth 1997 (NLSY97), has recently supported a wide array of research on criminal justice topics that use the NLSY97. This research has focused on the relationship of adolescent employment to delinquency, patterns of criminal recidivism over the life course, and relationships between family structure and delinquency. The National Institutes of Health (NIH) regularly solicits grants under its various programs, including R01, R09, and R21, which call specifically for the analysis of national secondary data sets. These are just a few of the examples of how sponsors of secondary data sets provide support to social science researchers for their analysis.

Use of Secondary Data for Applied Research

Secondary data sets provide a number of opportunities for applied researchers to conduct research that might otherwise be prohibitive due to the cost or time required. Contemporary secondary data sets, especially large-scale data sets sponsored by federal agencies, have several features in common. Most secondary data sets are nationally representative. Estimates from these data, when using the sampling weights provided, represent the U.S. population allowing for national estimates on a range of measures, including labor market participation, educational attainment, family formation behaviors, and public attitudes and opinions. They also allow for comparisons across different communities within the nation. For example, secondary data sets such as the PSID and the CPS enable researchers to examine differences in benefit receipt across states with different eligibility criteria and participation requirements. Finally, because they are large and nationally representative and contain a wealth of information, secondary data sets are sometimes used to derive comparison groups for program evaluations using techniques such as propensity score matching.

Most secondary data sets oversample or make special efforts to track populations of particular interest to researchers or policy makers. These include women, African-Americans, Hispanics, high school dropouts, military personnel, and households under the poverty line. Such oversampling ensures that the sample includes a large enough number of respondents in each of these important groups so that researchers can conduct analyses separately for each group, thereby facilitating comparisons among them.

Many secondary data sets are longitudinal, following the same individuals over several years or even decades. The backbone of many longitudinal secondary data sets is event histories. Secondary data sets often collect detailed event histories about respondents' life events, such as employment, school enrollment, marriage, childbirth, criminal behavior, government assistance, program participation, alcohol and drug use, and residential moves. At each interview, respondents are asked about events that happened since the last interview including the dates of such events. This strategy ensures a complete enumeration of important events even if a respondent missed an interview. Using these data, it is possible to construct monthly, weekly, or even daily histories of important events in respondents' lives. Such event histories allow researchers to examine trajectories over time and to investigate the causes and consequences of different patterns of development. For example, it is possible to know whether a childbirth preceded or followed a spell of dropout from high school.

In addition to collecting information from the primary respondent, many secondary data sets include data collected from other important individuals related to the respondent or influential in the respondents' life. These include surveys of spouses, biological or adoptive children, parents, teachers, school administrators, school counselors, and friends. The availability of social network data is a significant development in secondary data analysis. The National Longitudinal Study of Adolescent Health (Add Health) asked respondents to nominate five male and five female friends to be surveyed. Researchers are able to identify pairs and examine peer influence, pair formation and dissolution, relationship event sequencing, and relationship symmetry. Additionally, secondary data sets often include data collected from sources other than surveys, including school transcripts and medical examinations. Genetic information is increasingly becoming available in secondary data. Secondary data sets are often geocoded to provide rich contextual data such as school or neighborhood characteristics. It is often possible to link secondary data sets to administrative data on respondents, such as Social Security records or Medicare claims data.

Secondary data sets also facilitate comparisons across groups. Data sets that include complex stratified sampling techniques and data collected across wide geographic areas allow researchers to situate individuals within the larger context of neighborhoods, schools, and states through multilevel modeling. Several secondary data sets contain information from different historical cohorts, such as the National Center for Education Statistics (NCES) Surveys, to facilitate comparisons of economic, social, and cultural indicators across generations. Finally, a number of secondary data sets have 'sister' data sets based in other countries specifically designed to

permit comparisons across countries and over time. For example, a number of studies modeled after the PSID have been conducted in other countries facilitating international comparisons. These sister studies include: the German Socio-economic Panel, the British Household Panel Survey, the Household Income and Labour Dynamics Survey of Australia, and the Survey on Household Income and Wealth (Italy).

Despite the many advantages of secondary data sets, potential users should consider a number of drawbacks. First, many secondary data sets can be very challenging to work with and require a steep learning curve. Many of the survey instruments that underlie large-scale secondary data sets use complex skip patterns and all of the items of interest may not be asked of all respondents in all years for analysis. Users must familiarize themselves with the questionnaires, sample design, appropriate use of sampling weights, and calculation of standard errors in the presence of a sample design that often involves stratification and multistage (cluster) sampling. Second, because secondary data sets are available to any researcher, it is possible for other researchers to 'scoop' an idea and publish results prior to you. Finally, at a general level, the reliance on secondary data sets means that much of the scientific knowledge about specific topics is based on a disproportionate number of secondary data sets and is therefore subject to its limitations.

Overview of Secondary Data Sets

In this section, we provide a brief description of several secondary data sets that we believe have been influential in applied social and behavioral sciences. It is not possible to cover the literally hundreds of secondary data sets that are commonly analyzed; therefore we have chosen to highlight eight large-scale data sets that have served as a basis for extensive applied research. These data sets cover a broad array of topical areas and highlight the many strengths and weakness of secondary data sets. Each description includes an overview of the study design, content of the questionnaires, uses of the data set, and information on how to access it.

U.S. Census Bureau Data

The U.S. Census Bureau collects data on American households through two surveys. These are the American Community Survey (ACS) and the CPS.

The ACS is an ongoing statistical survey, sent to approximately 250 000 addresses monthly (or 3 million annually). It regularly gathers information previously contained only in the long form of the decennial census. It is the largest survey other than the decennial census that the Census Bureau administers. The ACS began in 1995 out of a desire to reduce the burden on Americans of the decennial census by shortening the census form and relegating collection of more detailed demographic, housing, social, and economic characteristics to a separate survey administered to a subset of households. The ACS was rolled out gradually and was fully implemented in 2005.

The goal of the ACS is to provide communities the information they need to plan investments and services. Information from the survey helps determine how more than $400 billion in federal and state funds are distributed each year. The survey collects data on demographic characteristics, household composition, income and benefit receipt, access to health insurance, education and employment, and housing. Unlike other surveys discussed here, participation in the ACS is mandatory for households that have been selected. Recipients who do not respond to the mailed request may receive a phone call or visit from a Census staff person. Surveys can be completed either online or by paper.

ACS data are publically available in 1-year, 3-year, and 5-year estimates. The 1-year estimates are released annually and provide data for areas with populations of 65 000 or more. The 3-year estimates provide aggregate information over 36 months on communities with populations of 20 000 or more. The 5-year estimates provide aggregate information over 60 months on all areas in the United States. Users can access information about the survey and methodology and the data and documentation on the ACS Web site at: http://www.census.gov/acs/www/.

The CPS is a statistical survey conducted by the U.S. Census Bureau for the Bureau of Labor Statistics to provide monthly estimates of the number of employed and unemployed people in the United States. Beginning in 1940, data were collected from approximately 60 000 households. A household is interviewed for four successive months, then not interviewed for 8 months, then returned to the sample for 4 months after that. An adult member of each household provides information about the employment status of each member of the household 15 years of age or older as of the calendar week containing the 12th day of the month. The survey also collects data on job characteristics, such as occupation, industry, wages and hours worked, job tenure, union membership, and education level.

Beginning in 1948, the CPS has included supplemental questions (at first, in April; later, in March) on annual income and benefit receipt. Other supplement topics include after-tax money income, benefits that are not cash, displaced workers, job tenure, occupational mobility, temporary work, adult education, volunteering, tobacco use, food availability, fertility, veteran information, and other related topics.

Monthly CPS data are available from January 1994 to the present, along with detailed information about the methodology on the CPS Web site at: http://www.census.gov/cps/data/.

National Longitudinal Surveys

The NLS, sponsored by the Bureau of Labor Statistics, are a set of studies that track the labor market experiences and life events of cohorts of men and women. The National Longitudinal Survey of Young Men is one of the original NLS cohorts. It includes 5225 men who were at ages 14–24 when they were first interviewed in 1966. Interviewers with this cohort stopped in 1981. The National Longitudinal Survey of Older Men also began in 1966 and includes a sample of 5020 men who were at ages 45–59 at the time. Although this survey was also discontinued in 1981, interviews with living respondents and widows or next-of-kin were conducted in 1990. The National Longitudinal Survey of Young Women includes women who were at ages 14–24 in 1968. The National Longitudinal Survey of Mature Women includes women who were at ages 30–44 in 1967. This study was completed in 2003. The NLSY79 is a national sample

of men and women born between 1957 and 1964 and who were at ages 14–22 when they were first interviewed in 1979. The original respondents were followed for 24 waves with the most recent in 2010. Begun in 1986, the NLSY79 Children and Young Adults (NLSY79-C) is a study of the biological children of female respondents of the NLS79. Finally, the NLSY97, sometimes referred to as the 'new NLSY,' is a nationally representative sample of youth born between 1980 and 1984 who were at ages 12–17 when they were first interviewed in 1997. Youth are interviewed annually and this study is still ongoing. Below, we provide a more detailed description of the NLSY97.

Although primarily sponsored by the U.S. Bureau of Labor Statistics to understand labor force participation, education, government program participation, and other topics, the NLSY97 receives funding from several federal agencies that sponsor sets of questions within the survey on other topics. These include the questions on crime and delinquency sponsored by the U.S. Department of Justice, questions on pregnancy and fertility sponsored by the National Institute of Child Health and Human Development, school surveys sponsored by U.S. Department of Education, and cognitive tests sponsored by the U.S. Department of Defense.

The NLSY97 is a nationally representative longitudinal survey of youth who were 12–16 years old as of 31 December 1996. The NLSY97 sample is composed of two independent probability samples: (1) a cross-sectional sample of 6748 youths who are representative of the noninstitutionalized population of youths in the United States, and (2) an oversample of 2236 black and Hispanic youths. The cohort was selected using these two samples in order to meet the survey-design requirement of providing enough black and Hispanic respondents for statistical analyses. Original Wave 1 respondents continue to be interviewed annually. As of this writing, 14 waves (through 2010) of data are available. NLS surveys are well respected due to their relatively high response rates. In the case of the NLSY97, about 90% of the original cohort responded in Wave 10. In addition to annual youth interviews, data were collected from a parent interview in 1997, school surveys in 1996 and 2000, and school transcripts when respondents left high school or turned age 18.

Although primarily designed to collect information on labor and education, the NLSY97 collects fairly detailed information on a vast number of other topics, including delinquency and crime, substance use, fertility and childbearing, marriage and cohabitation, health, income, government program participation, and political participation, to name a few. Detailed monthly event histories are also available for arrests, pregnancies, births, marriages, program participation, and residential moves.

The Center for Human Resources Researcher at Ohio State University has created the NLS Investigator, an online data extraction tool for the NLSY97 data. It can be accessed at: https://www.nlsinfo.org/investigator/pages/welcome.jsp.

National Longitudinal Study of Adolescent Health

Add Health is a longitudinal study of a nationally representative sample of adolescents aimed at understanding causes and consequences of adolescent health and health risk behaviors. A sample of high schools and their feeder middle- or junior-high schools was selected through a stratified, school-based, cluster sampling design.

A random subsample of 20 745 adolescents in grades 7–12 during the 1994–95 school year was selected to complete In-Home Questionnaires for Wave 1. The respondents were followed into young adulthood with three follow-up in-home interviews, in 1996, 2001–02, and 2007–08. Add Health collects data on respondents' social, economic, psychological, and physical well-being with additional data on the family, neighborhood, community, school, friendships, peer groups, and romantic relationships. The fourth wave of interviews included collection of biological data to provide an opportunity to understand the link among social, behavioral, and biological characteristics in health during the transition to adulthood. Other sources of data include questionnaires for parents, siblings, classmates, and school administrators and interviews with romantic partners. The data also include geocode information that allows for links to neighborhood and community level data.

Add Health was developed in response to a mandate from the U.S. Congress to fund a study of adolescent health. Add Health is directed by Kathleen Mullan Harris (UNC, Chapel Hill), with fieldwork done by National Opinion Research Center (Waves I and II) and Research Triangle Institute (Waves III and IV). Add Health is funded by the National Institute of Child Health and Human Development (NICHD) with co-funding from 23 other federal agencies and foundations.

Add Health data can be accessed through the ICPSR Web site at: http://www.icpsr.umich.edu/icpsrweb/ICPSR/studies/21600/datasets. Information about the data collection and sampling, codebooks, questionnaires, and lists of publications that use the data can be found at http://www.cpc.unc.edu/projects/addhealth.

The National Center for Education Statistics Surveys Program

The NCES Surveys Program includes 51 surveys and data sets in seven areas related to educational issues. Of particular interest to social scientists who study human development are the Early Childhood Longitudinal Studies (ECLS) Program, the first national study of children from birth through childhood, and the Secondary Longitudinal Studies Program, which include several national longitudinal studies designed to track students from early childhood through postsecondary education and adulthood. The early childhood studies include the Early Childhood Longitudinal Study, and the Kindergarten and Birth Cohorts (ECLS-K and ECLS-B, respectively); the secondary studies include the National Longitudinal Study of the High School Class of 1972 (NLS:72), High School and Beyond (HS&B), the National Education Longitudinal Study of 1988 (NELS:88), the Education Longitudinal Study of 2002 (ELS:2002), and the High School Longitudinal Study of 2009 (HSLS:09). Data collection for the latter two studies is still ongoing. Although the primary focus of these studies is on educational processes and outcomes, they contain a rich set of variables pertaining to nonschool factors of interest to social scientists concerned with a diverse array of topics other than education and warrant inclusion in this article. Below, we briefly highlight

the most recent of these longitudinal studies: HSLS:09 and its connection to the other studies.

HSLS:09 is the latest generation of longitudinal studies designed to track students as they transition from high school to postsecondary education or work and adulthood. HSLS:09 is a nationally representative sample of approximately 24 000 students who were in the ninth grade in 2009. The study uses a two-stage sample design in which 944 public and private high schools were selected in the first stage and 25 ninth-graders per school were selected in the second stage. High school dropouts are identified and followed. This overcomes a known weakness of school-based samples for studying high-risk groups, such as high school dropouts, who tend to be more difficult to capture than in a household survey.

HSLS follows students from high school into post-secondary education and adulthood. Students were surveyed in the fall of ninth grade (2009), in the spring of eleventh grade (2012), and in the spring after high school graduation (2013). Future data collections are planned to take place 2 years after the expected high school graduation year (in 2016) and again in 2021. HSLS also includes surveys of parents, math and science teachers, school administrators, and counselors as well as mathematics assessments.

All NCES data sets can be accessed using the Data Analysis System at: https://nces.ed.gov/das. Users can conduct online analysis or download data sets and extraction programs.

Fragile Families and Child Wellbeing Study

The Fragile Families and Child Wellbeing Study is a study of approximately 5000 children born to 'fragile families' in 20 urban areas in the United States between 1998 and 2000. 'Fragile families' are families composed of unmarried parents and their children, which are typically at greater risk of breaking up and living in poverty than two-parent families. The goal of the Fragile Families data is to address four primary research questions: (1) What are the conditions and capabilities of unmarried parents, especially fathers? (2) What is the nature of the relationships between unmarried parents? (3) How do children born into these families fare? and (4) How do policies and environmental conditions affect families and children?

Using stratified random sampling and oversampling of nonmarital births, baseline data were collected from 1998 to 2000, through interviews with both biological parents shortly after the child's birth. Follow-up interviews were conducted when the child was one, three, five, and nine years old. As of this writing, the sixth wave of data collection, when the child is 15 years old, is ongoing. In addition to parents, the last three waves have included in-home assessments, child care or teacher assessments, and interviews with the child.

The parent interviews collect information on household characteristics, family relationships, parenting behavior, demographic characteristics, parent and child health (mental and physical), economic and employment status, neighborhood characteristics, and benefit receipt. Several collaborative studies provide additional information on parents' medical, employment, and incarceration histories, religion, child care, and early childhood education.

The study is funded by the National Institute of Child Health and Human Development and a consortium of private foundations and other government agencies. Fragile Families is a joint project of Princeton University and Columbia Universities. The principal investigators of the project are Sara McLanahan and Christina Paxson at Princeton; and Irwin Garfinkel, Jeanne Brooks-Gunn, and Ron Mincy at Columbia. The first fives waves of data are available on the web at http://www.fragilefamilies.princeton.edu/public.asp along with detailed information about the study design, data documentation, and publications using the data.

Panel Study of Income Dynamics

The PSID is the world's longest running household survey. The PSID was originally funded by the Office of Economic Opportunity of the U.S. Department of Commerce to monitor the impact of President Lyndon Johnson's War on Poverty and is currently funded primarily by the National Science Foundation, although it also receives support from a number of government agencies, foundations, and other organizations. The original PSID sample consisted of two samples: (1) a national sample, known as the Survey Research Center Sample (SRC), and (2) an oversample of low-income families designed to study issues related to poverty, known as the Economic Opportunity Sample. About 5000 families representing 18 000 individuals were included in the original 1968 sample and have the 'PSID gene.' In 1997, the PSID added the children of more than 2300 PSID families to replenish the sample and facilitate generational research (these children are also said to have the PSID gene). The PSID sample has experienced high retention rates and has grown considerably over time. In 1997, concerns over changing demographics of the United States resulted in the addition of a new immigrant sample to the PSID. Using the sampling weights, the PSID closely resembles the demographics of the U.S. population. The current sample includes 9000 households and 22 000 individuals.

Data are collected from all household members, but more detailed data are collected from the head of household and if, married or cohabitating, the spouse or partner, and 'other family unit members.' The original PSID sample members were followed annually from 1969 through 1997 and biannually beginning in 1997. In 1997, the Child Development Supplement was added in which the biological and adoptive children of PSID were added to the sample. These individuals were interviewed in 1997 when they were 0–12 years old and again in 2002/2003 and 2007/2008 when they were 5–18 and 10 and 18 for the third wave. Once they turned 18, the children continued to be interviewed in the Transition to Adulthood Study. They are interviewed biannually (2005, 2007, 2009, and 2011). In 2009, a supplemental data collection on Disability and Time Use (DUST) occurred for nearly 750 husbands and wives. Information was collected from two randomly selected days. Information was obtained using time diaries about what respondents did, where they were, who did the activities with them, who else was there, how they felt, and for household and care-related activities, for whom the activity was carried out. The survey also included information about well-being for three randomly selected activities per diary.

The original intent of the PSID was to collect data on the economic well-being of Americans. Since that time, additional

content has been added to the survey to reflect changing policy interests. In 2011, the 89-minute survey collected information on the following topics: employment, earnings, income, housing, foreclosure and mortgage distress, geospatial data, health status, adult behaviors, adult and childhood health conditions, health insurance, marriage and fertility, program participation, vehicle ownership, wealth and pensions, debt, and philanthropy.

The majority of PSID data is available on the Internet through the PSID Data Center: http://simba.isr.umich.edu/data/data.aspx. Users can create custom extracts and codebooks and can archive extracts for later use. Supplemental files are not available through the Data Center because they are of a different structure than the main interview files. See the above link for information on use of supplemental files.

Wisconsin Longitudinal Study

The WLS is a long-term longitudinal study of a random sample of men and women who graduated from Wisconsin high schools in 1957. The WLS is funded by the Behavioral and Social Research Program at the National Institute on Aging. The WLS began as a survey of Wisconsin high school seniors' plans for postsecondary education. In the early 1960s, William Sewell, a sociology professor at UW, learned that the surveys were located in the basement of a UW administrative building. He drew a random sample of 10 000 of the graduates and the survey has been following respondents for five decades. The sample was expanded in 1977 to include 2000 randomly selected siblings and again in 1997 to include 5000 siblings.

The sample followed respondents in 1964, 1975, 1992, 2003, and 2011. Data were collected from siblings in 1977, 1993, 2004, and 2011. Data were also collected from the spouse of the respondents in 2004, from the spouse of the siblings in 2006, and from the widows(ers) of graduates and siblings in 2006.

In 1992, when respondents were 35–45 years old, the content began to shift away from careers, education, and family to a sharper focus on health and aging. The survey provides complete longitudinal information on social background, attitudes, and aspirations in young adulthood, high school curriculum, labor market experiences, family formation, and social participation. The survey maintains a focus on understanding the influence of social background and adolescent experiences. The 2004 data collection included the following topics: education, marital history, status of parents, health, employment, pensions, retirement attitudes, income, health insurance, use of medical care, volunteer activity, alcohol history, religious preferences, the Internet use, psychological well-being, end-of-life preparations, values and attitudes, dealing with problems, current psychological states, and use of long-term care insurance. The data set also includes biomarker data, including height, weight, waist and hip circumference, grip strength, lung function, gait speed, and mobility. In the spring of 2006, saliva samples and DNA information was collected from about 4500 of the graduates and 2500 siblings.

Public-use WLS data can be downloaded directly from the WLS Web site at: http://www.ssc.wisc.edu/wlsresearch/data/. Users can download the complete data set or subsets of respondents. Some sensitive variables are not available publically but only to those who complete a restricted use agreement. The WLS Web site contains detailed data set documentation that can be downloaded, including codebooks, questionnaires, and analysis of response rates. The Web site also contains a tool that allows users to search for variables in the data set by name or description.

Health and Retirement Study

Sponsored by the National Institute on Aging and the Social Security Administrative, the Health and Retirement Study (HRS) is a nationally representative longitudinal study of approximately 26 000 Americans over the age of 50. The HRS has its roots in the Retirement History Study (RHS), which was conducted in 1969 and 1979. By the mid-1980s, it was recognized that the RHS had become dated, underrepresented women, blacks, and Hispanics – groups that had become a larger share of the labor market – and did not include questions on physical or mental function. The HRS began as two distinct but closely related surveys and has expanded over time to include new cohorts. The 'original HRS' was administered in 1992 to a sample of Americans at ages 51–61 and their spouses. The Study of Assets and Health Dynamics among the Oldest Old (AHEAD) began in 1993 as a sample of Americans aged 70 and older and their spouses. Both the original HRS and AHEAD were integrated in 1998, at which time two new cohorts were added. The first group was composed of people born between the two cohorts – 1924 and 1930 – and raised during the Great Depression (Children of Depression Age or CODA). The second group was designed to replenish the sample with people in their early 50s, known as the war baby cohort, born between 1942 and 1947.

HRS respondents are interviewed every 2 years. The 1-h interview broadly focuses on three topics: economics, family, and health. Within these broad categories, the survey focuses on the following topics: economic circumstances, occupations and employment, health and health care, cognition, living and housing arrangements, and demographics and family relationships. Special permission was obtained from respondents to link the interview responses to other data sources, including Social Security records on employment and earnings and SSI and SSDI benefit decisions and payments, Medicare claims data, and employer survey data focusing on pension plan provisions. These linked data are only available to researchers under a restricted use agreement. In addition, the HRS has genotyped 12 507 respondents who provided DNA.

Information on downloading the public use HRS data can be found at: http://hrsonline.isr.umich.edu/index.php?p=data. RAND data files are also available for download on this site.

This article is reproduced from the previous edition, volume 1, pp. 642–646, © 2001, Elsevier Ltd., with revisions made by the Editor.

Abstract

This article discusses the history of archives from antiquity to the present day. It makes clear that archives follow a legal tradition that reaches back to the beginnings of occidental civilization. The use of archives for research is a relatively recent development: it basically began with the French archives law of 1794. A broad organization of archives, both public and private, has developed since that period and now encompasses all the countries in the world. The scope of this material (i.e., charters, records, registers, maps, plans, audiovisual media, electronic documents, private collections, and archives) and its appraisal pose serious problems for archivists today. Those problems include all questions dealing with preservation and information technologies.

This article discusses the history of archives from antiquity to the present day. It makes clear that archives follow a legal tradition that reaches back to the beginnings of occidental civilization. The use of archives for research is a relatively recent development that basically began with the French archives law of 1794. A broad organization of archives, both public and private, has developed since that period and now encompasses all the countries in the world. The scope of this material (i.e., charters, records, registers, maps, plans, audiovisual media, electronic documents, private collections, and archives) and its appraisal pose serious problems for archivists today. Those problems include all questions dealing with preservation and information technologies.

Terminology and History of Archives

The term 'archive' comes from arché, the Greek word for beginning. In Herodotus' History, Archeion is the town hall or government office. The word was not used to refer to preservation of the written word in ancient Greece, but was used in that manner by Josephus and later by Eusebius during the Hellenistic period. Roman jurists later adapted the Greek Archeion, using it in the Latin Archium and later Archivum. By the end of the fourth century, Archivum refers to the place where public records are preserved (locus quo acta publica asservantur). The archival tradition, therefore, is not based on the concept of preservation for research, but it was preservation for public administration purposes. Elements of this idea that archives only preserve public documents can still be found in present-day British and Dutch archives. It follows that the English language makes a difference between records that possess legal character and papers that possess no such qualities. The official character of such archival material as well as the fact that its preservation is a responsibility of the state, both explain the understanding of public faith and the concept of unbroken custody in the Anglo-Saxon world.

Research done by Johannes Papritz, Ernst Posner, and others indicates that clay tablets from 3000 BC found in the Near East were preserved to facilitate commercial and public administration. Strictly speaking, these tablets are registries, but were not intended for permanent preservation as an archive. Literature that uses the term 'clay tablet archives,' often referring to the royal palaces of Minoan civilization on Crete and the Palace of Nestor at Pylos (Peloponnese), is therefore misleading. While clay tablets are exceptionally durable, even fire-resistant, other material used to write on, such as leather, wooden tablets, or papyrus, proved to be less durable. Finds of such materials are therefore quite fragmentary. In Athens, laws and decrees of councils and assemblies, documents concerning acts of state, and copies of state-commissioned plays were stored at the town hall and, after the fourth century, at the Temple of Kybele. In Rome, senate resolutions were kept in the Temple of Saturn until 78 BC, and after that time senate minutes, state payment demands, census records, and so forth were placed in the 'Tabularium.'

Some remains of this ancient tradition can be found in the registers of the Middle Ages, that is, in the secure documentation of resolutions and records through continuous notation on archival tablets, which were later replaced by papyrus rolls. In AD 538, Emperor Justinian ordered all cities to preserve the commentarii and gesta municipalia, to facilitate jurisdiction, in a separate location, the Archeion or Archivum. Nevertheless, political upheavals in late antiquity and the beginning of the medieval period led to breaks in archival traditions. Roman registers can still be found in the cities of northern Italy and Gallia Cisalpina. Notary registers as compiled by Johannes Scriba of Genoa came into use in the middle of the twelfth century. The Papal Curia reintroduced register-keeping in the eleventh century (on parchment since 1088, though only records from 1198 survived due to a fire in the Lateran). The papal example may have had influence on the creation of royal archives in Aix-la-Chapelle under Charlemagne. The lack of a permanent residence among his heirs prevented the development of an archival organization. The influence of Persian–Arabian legal practice under Norman rule in Sicily could still be felt in France and England in the twelfth century.

Unlike the archives of antiquity, those developed in the medieval period did not serve the public interest in the first place, but rather helped to secure legal positions of individual institutions and groups, i.e., church and monastic repositories, municipal archives, and archives of the nobility.

The refinement of paper in the fourteenth century led to a reorganization of office and chancellery management. Registers, minutes, bills, and so forth became an administrative memory. Older archives were rearranged and concentrated in the fifteenth and sixteenth centuries: the Spanish court archives at Simancas (1548) are one notable example.

Modern Archives since the French Revolution

The French Revolution was an important turning point in the advancement of the archives. It was the revolution that introduced the developments we associate with archives today. The concentration of archival materials in central locations, the organization of an archives administration, the civil administration's jurisdiction over registries, public access, and historical research are all characteristics of this new world of archives.

The National Archives in Paris, established in 1789–90, was initially intended only for the preservation of records produced by the National Assembly. Records from ancien régime administration boards were not incorporated until 1793. The law passed on 25 June 1794 declared the National Archives to be a Centre Commun, giving citizens the right of access to the documents preserved. The departmental archives were created and put under the jurisdiction of the National Archives 2 years later. Much literature refers to 1794 as the 'constitution' of modern archives. Napoleon's 'Universal Archive' of 1810–11, which integrated important artifacts from the conquered German Empire, Austria, Italy, Spain, and the Vatican, lasted only briefly. What made the National Archives revolutionary was the fact that the arrangement of the archives followed the librarians' principle of pertinence. In 1839, initial calls were made, however, to introduce in the departmental archives the principle of provenance, which was codified in a circular on 24 April 1841. This concept of respect de fonds stipulates that all records created by one institution remain together. The paleographer Natalis de Wailly said of it, "La methode est fondée sur la nature des choses." The same principles were introduced on a municipal level in 1857.

In 1861, the principle of provenance was realized in Denmark's ministerial archives. In Germany, it was Prussia that prescribed the principle of provenance with the regulation of 1 July 1881: "Every government board will, once it generates records, receive its own repository." The regulation initially applied only to the Prussian Secret State Archives. Not until 1896 were the provincial archives advised to follow suit. Primary credit for the international success of the principle of provenance in the following decades must be given to the Dutch: In the Netherlands, the principle of provenance was introduced in 1897. The archivists Samuel Muller, Johan Adriaan Feith, and Robert Fruin described the principle of provenance in their handbook of archives, achieving worldwide recognition for Dutch archival theory. Translations into German (1905), Italian (1908), French (1910), and English (1920) followed. The conclusion of this discussion, which dominated the late nineteenth and early twentieth centuries, came at an international conference in Brussels in 1910. Archivists claimed the principle of provenance as fundamental for their profession. The principle of provenance had been accepted by Denmark in 1903, and by Sweden and the USA in 1909. Vienna's Haus-, Hof-, and Staatsarchiv accepted it in 1914. In 1920, Hilary Jenkinson achieved implementation in England, where the law had controlled archives since 1838. A decree by Lenin issued on 1 June 1918, dealing with the reorganizations of archives, gave Russian archives the chance to respect the principle of provenance whenever possible. An international conference in Stockholm in 1993 proved that the principle of provenance continues to play a role in international archival theory and discussion.

Records as Historical Sources: Appraisal and Use

Historical research and the development of critical methods, as exemplified by the German editions of the Monumenta Germaniae Historica since 1826, promoted archival description of older documents. Inventories have been published in England, France, and Belgium since the third decade of the nineteenth century. Editions of charters and records from Prussian archives have appeared since 1878.

While historians in Germany still discussed Karl Lamprecht and his cultural and sociohistorical theory from 1893 to 1898, archivists were already discussing topics that were very modern at the time, such as whether or not to preserve judicial records, which contained material on the administration of justice as well as the moral, financial, and economic circumstances of different classes of society. There were demands for the preservation of records relating to the labor movement and social questions, for census records, and, from 1904 onward, there were tendencies to preserve archives from private firms. It is no coincidence that during the first decade of the twentieth century in Germany the first private business archives were established. These were quite different from Europe's preindustrial trade and merchant registries that survived from the late Middle Ages (e.g., the Datini archives in Prato).

The disintegration of states and society as well as the massive amount of documentation in the twentieth century has led to an international discussion on archival appraisal and preservation. All efforts to come up with a generally applicable model of appraisal have led to dead ends. Obviously, every model of appraisal is in a certain way subjective in that historians' initial questions are formed by their generation: "Every political system considers different documents worthy of preservation" (Papritz, 1983). A free society cannot dictate binding rules for appraisal. The result of this insight was a closer look at Theodore R. Schellenberg's (1903–70) theories. Schellenberg (1964), former administrative head of the US National Archives, first published *Modern Archives: Principles and Techniques* in 1956. In the Anglo-American world at least, Schellenberg's ideas changed appraisal theory fundamentally. Schellenberg called for the appraisal of an entire institution's records. Besides the information in the documents about people, places, and events that was documented (the 'content' of records), the principle of evidence is focused on. Evidence in public records involves the archivist finding out how the originating government bodies functioned and what competence they had. For appraising purposes, it is indispensable that the archivist knows how the records in question were produced. The decision of whether or not to preserve records is then made on both formal and content-based criteria.

Papers issued by the Paris-based International Council of Archivists (ICA) indicate that networks of archives exist worldwide, even in developing nations. Because of its rich cultural tradition, China has the greatest number of archivists. Most countries have laws regulating users' access to archives. Conditions on access vary greatly. The Vatican only allows access to documents originating before 1922, while Scandinavians enjoy freedom of information rights that include access to current registries. In the Anglo-Saxon countries and Germany, there is a limitation on access of 30 years. Records on individuals and private data are regulated separately.

Current Problems: Preservation and Information Technology

Archives deal with two major problems today: the conservation/preservation of archival material and the effects of information technology. The material that is to be preserved does not age well, compared to medieval parchment. It requires the employment of complicated preservation techniques, among them are restoration, microfilm, and digitization.

As far as information technology is concerned, archives are presented with two major challenges: they must develop models for appraising and taking over of electronic media and they wish to provide universal access for researchers as well as for an interested public. The NARA (National Archives and Record Administration) in Washington, DC is the most experienced in this field. As of May 1999, some 100 000 files comprising more than 500 gigabytes had been taken over and stored there. Some 10 000 new files are expected to be added every year. Data that are transferred must first be copied onto separate tapes or cassettes. This procedure then has to be repeated every 10 years (concept of migration). A provisional list of the data available can be found on the Internet. Since data loss can occur in the copying process, Jeff Rothenberg has come up with a concept for emulating software that allows archivists to make copies using the original or related programs. The concept is currently undergoing tests as part of a project in the Netherlands. The goal of the project is the long-term preservation of digitized data in their original, authentic form (concept of emulation). In Germany, the German federal archives, the Bundesarchiv, is the most experienced in the appraisal and storage of digitized data. The Bundesarchiv is involved in a pilot project sponsored by the federal administration office called DOMEA (Document Management and Electronic Archiving in IT-supported operations), which is developing methods of saving, appraising, and preserving electronic files permanently.

For research purposes, the new possibilities that allow the searching of archives both nationally and internationally via the Internet are especially interesting. In Germany, most archives are accessible via the Internet. The state of North Rhine-Westphalia alone has made some 450 guides to state, municipal, church, and business archives accessible for Internet users. Marburg Archive School has presented the prototype of an online search aid especially suited to German descriptive methods, but also with an interface to an international standard of Internet presentation of search aids.

A major undertaking being discussed internationally is called EAD (Encoded Archival Description). In the USA, the Berkeley Art Museum, California State University, and the Library of Congress were instrumental in developing EAD, and have been joined by the Public Record Office in London. EAD has found an ever-growing following in the Anglo-Saxon world since the mid-1990s. It has meanwhile been made compatible with the International Standard Archival Description (ISAD) issued by ICA. Actually implementing these standards on a large scale requires a retroconversion of handwritten and typewritten search aids to a digital format. In Britain, home to some 2000 archives, the National Council on Archives introduced an archival network in 1998, which, after retroconversion of existing search aids, will provide a virtual guide to the archives and an incentive to make increased use of the archives over the Internet. The San Francisco-based Research Library Group (RLG) knows no national boundaries. Founded in 1974, the group comprises some 160 member universities, libraries, archives, museums, and scientific organizations. Databases of libraries and digitized finding aids of archives are made accessible by RLG.

In the 1990s, technological progress has changed archives in a way experts never thought possible. Following the digitization of archival guides, and the retroconversion of existing search aids and the organization of this metadata into databases, the digitization of entire fonds seems at least possible. Most progress has been made in digitizing collections of individual items like photographs and posters from various institutions such as museums, libraries, and archives. The digitization of files, that is, documents with several pages, has not yet begun. Information technology has made archives still more accessible and interesting for the public and has blurred the lines between archives, libraries, and documentary institutions.

Data Bases and Statistical Systems: Communications and Media

Wolfgang Seufert, Friedrich-Schiller-University Jena, Jena, Germany

© 2015 Elsevier Ltd. All rights reserved.

Abstract

The article presents the most important statistical systems that regularly provide data on communications and media suitable for secondary data analysis in social research. These data from official and nonofficial statistical sources have some essential limitations. Some arise from a lack of data provided by official sources, particularly for data on markets and on the cultural, political, and social dimensions of communications and media. Nonofficial sources fill this 'availability gap' to some extent. However, some severe methodological constraints underlie data from industry associations or commercial data providers, which should be explicitly discussed when used in secondary analyses.

Economic and social research on the impact of communications and media on the society often relies on secondary data analyses, due to the fact that primary data collection is time consuming and expensive. The following article intends to present the most important statistical systems that provide data on communications and media, including their methodological limitations (cf Seufert, 2006).

One of the key characteristics of the communications and media field of research is continuous change in the underlying communication and information (IC) technologies. In the 1980s, 'digitisation' or 'convergence' transferred telecommunication networks, equipment, and media storage and media distribution technologies into another form of data processing technology. The emergence of Internet technology over the last several decades has even altered the meaning of 'communications' and 'media' to some extent. Hence, both terms should be clarified first.

Twenty years ago, it was easy to draw up a frontier between (tele)communications and (mass)media. The term 'communications' was used for various types of private one-to-one communication, based on postal services or telecommunications networks. The term 'media' was used for various types of public one-to-many communication, based either on terrestrial, cable, and satellite distribution networks or on storage technologies (printed paper, sound records, and video records). Internet technology, or more exactly the World Wide Web, now integrates new ways of one-to-one communication (e.g., via email or voice-over-IP) and of mass media communication (e.g., web TV or music-on-demand portals). Furthermore, it also enables a new hybrid form of network-based communication in social networks that is to some extent private and to some extent public. Companies like Twitter, YouTube, Facebook, etc. provide the necessary infrastructure for this new kind of social communication, which is often summarized under the notion of 'social media.'

The following overview covers data suitable for secondary analyses in social research, as provided by the most important official and nonofficial sources on communications, traditional mass media, and new forms of network-based social communication.

Research Questions and Data Needs

What statistical data is appropriate to analyze the communications and media system of a society? The answer to this question differs according to the research interests of scientific subdisciplines. Economic researchers, for example, usually require other data than researchers from other social science disciplines.

Researchers with a focus on telecommunications and mass media economics belong to two scientific communities. Industrial economists focus on the typical economic behavior of actors in telecommunications and media markets and for optimal regulation regimes for those markets in order to maximize economic welfare (cf Albarran, 2010; Doyle, 2002; Picard, 2002; Majumdar et al., 2005). Research in business administration is more interested in finding the best solutions for typical management problems of telecommunication carriers or media companies in order to achieve business success (cf Küng, 2008; Vogel, 2011). Both groups of economic researchers require four types of quantified statistical information to test their hypothesis and their respective underlying economic theories:

1. Statistical information on enterprises and industries: Variables describing the supply side of telecommunications and media markets, and variables which allow for calculations of the macroeconomic relevance of the communications and media sector within the national economy by size, growth, or productivity effects (e.g., sectorial data on gross value added, gross income, number of employees, immaterial investment into intellectual property, etc.).
2. Statistical information on market concentration: Variables describing the market power of different market players by economic concentration indicators (e.g., the number of suppliers, the turnover shares of the biggest companies in the market, etc.).
3. Statistical information on size and structure of market demand: Variables describing market size and price levels of telecommunications and Internet services or media products, including information on the detailed demand structure of households and enterprises for this range of goods (e.g., turnover, sales volume, price indices). It also includes information on the advertising demand of enterprises, as mass media are to a large extent financed by advertising.
4. Statistical information on the technical infrastructure required for telecommunications, Internet or audiovisual media: Variables describing the capacity of telecommunication networks and media distribution networks, the access to these various services, and the inventory of transmitter–receiver equipment in households or enterprises

 http://dx.doi.org/10.1016/B978-0-08-097086-8.41067-6

(e.g., proportion of individuals or small and medium enterprises with access to broadband Internet or mobile telephone services, the average number of TV channels received by households, etc.).

Social scientists, particularly those from the disciplines of sociology, political science, and communications science, are more interested in the impact of communications and media on the society as a whole (e.g., on the social structure, social habits, and common beliefs). Of particular interest is the impact of traditional media content reception, or the participation in social media debates, on political decisions and the political systems (cf Knoche, 1999; McQuail, 1992; Van Cuilenburg, 1999). Researchers who are interested in cultural, political, and social dimensions of communications and media usually request three additional types of quantified statistical information:

5. Statistical information on the use of telecommunications service and the Internet: Variables describing in detail the frequency and type of different telecommunication services or Internet activities including data about the user structure (e.g., sending or receiving email, participating in social networks, selling or purchasing goods or services, streaming or downloading images, movies and other media content, blogging, etc.).
6. Statistical information on media use: Variables describing in detail the demand for different types of media content including data about audience structure (e.g., time spent on radio use per day, the breakdown of TV viewers or cinemagoers by sociodemographic variables, etc.).
7. Statistical information on media content: Variables describing the quality or diversity of content in mass media in detail (e.g., the total number of published newspapers or magazines, the number of feature films of different genres exhibited during a year, the breakdown of TV programs by format categories, the proportion of speech or music content in radio programs, etc.).

All relevant statistical information related to communications and media activities in a society can be analyzed by either microdata or aggregated data. Economists are used to working with macrodata, particularly in time series analyses, using averages or total figures for groups of subjects in countries or other regions, usually defined by political boundaries. Empirical social scientists usually prefer to work with microdata, i.e., by using statistical information from individual enterprises, households, or 'publication units,' e.g., TV channels, newspaper titles, etc.

Official and Nonofficial Data Sources

As in other research fields, two groups of statistical systems provide data on communications and media: official and nonofficial sources.

Official Statistical Sources

'Official statistical sources' on the national level comprise national statistical institutes (NSI) and other government institutions. Central banks, for example, are responsible for the data collection on international financial flows related to the exploitation of intellectual property rights (e.g., income from film licenses). In many countries, national regulatory authorities (NRA) for the telecommunications or media sector also provide regular data on market concentration and other variables relevant for regulatory purposes. Some examples for NRAs are Autorità per le granzie delle communicazioni (AGCOM): www.agcom.it; Federal Communications Commission (FCC): www.fcc.gov; Kommission zur Ermittlung der Konzentration im Medienbereich (KEK): www.kek-online.de; Office of Communications (Ofcom): www.ofcom.org.uk. Most of the economic indicators related to communications and media comply with internationally concerted classifications of production output or consumption activities (c.f. below). This is not the case for most of the indicators describing the cultural, political, or social dimensions of the use of communications and media. One exception is the international classification of activities for time-use statistics (ICATUS), developed by the UN statistics division (UNSD). (UN statistical unit division: UN classifications registry – ICATUS (www.unstats.un.org). It includes 'time spent using mass media' as one of 15 main activity categories.)

Some supranational, intergovernmental institutions partly fill this gap and provide harmonized statistical data on media content, media use, or Internet use, which is suitable for cross-country analyses, namely UN suborganizations (International Telecommunications Union (ITU), UNESCO) or the OECD. One example is Information and Communication Technology (ICT) usage indicators, published by ITU (cf below). In most cases, these supranational official statistical sources do not collect their own data but use data from national sources of their member states. They are usually restricted to use data only from NSIs or other official sources. However, in some cases, they collect additional data from nonofficial sources. This applies particularly for the European Audiovisual Observatory (EAO). Since 1992, the Council of Europe finance the EAO to collect and publish statistical information on audiovisual markets in all member states (at present there are 47 member states: all European countries except Belarus, plus Armenia, Azerbaijan, Georgia, the Russian Federation, and Turkey), North America, and Japan (www.obs.coe.int). The provision of harmonized statistical data on communications and media on EU Community level is also part of the mandate of EUROSTAT, the general directorate of the European Union.

Based on law, official sources can force enterprises or households to participate in statistical surveys, but have the obligation to maintain secrecy to individual household or enterprise data. Therefore, most data is published anonymous on an aggregated level. However, even for industries, enterprise size classes, or household income groups, one can find dots in the published data of official sources. This is particularly the case for aggregated data from smaller regions, if, for example, the total number of enterprises is less than five or if one enterprise of the region has a turnover share of 90% of more (cf Cox et al., 1995). However, there are two exceptions to this rule. Anonymized microdatasets are in some statistical areas available as public-use or scientific-use files, as, for example, with household budget surveys. Individual enterprise data are

available for publicly owned companies, particularly for public broadcasters. It was also available for public telecom carriers until their privatization in the 1990s.

Nonofficial Statistical Sources

The term 'nonofficial statistical source' comprises a heterogeneous spectrum of data providers: nonprofit organizations and companies that provide data as a business activity.

Commercial, nonofficial sources include a broad range of profit-oriented data providers, surveying the economic performance of companies, advertising activities, private consumption of communications and media products, and media use (cf below). However, industry associations publish most of the nonofficial data on communications and media. They serve information needs of member companies but their statistical work is often also a part of lobbying activities. To demonstrate the economic importance of their specific industry, associations have the tendency to include economic activities from neighbor industries, with the result of double counting of market sales or number of employees. Statistical information of industry associations is normally limited to aggregated market data on turnover, number of sold units, average prices, etc. Compared to official sources, it has a much more detailed breakdown by product categories. Some industry associations collect information that is more detailed, particularly data on cost structures. However, to maintain information of individual members confidentially the statistical reports contain only average cost figures for the whole industry or for enterprise size classes.

Several supranational nonofficial sources publish cross-country data on telecommunications and media markets. (The EAO, for example, uses statistical information from the European Broadcasting Union, the European Cable Communications Association, the Group of European Audience Research, the International Federation of Phonographic Industry, and the International Video Federation for its audiovisual yearbooks.) This data is in most cases taken from various national nonofficial sources. Since industry associations or commercial surveying companies from different countries usually work with different classifications and with different data collection methods, there is a general risk to compare apples and oranges. When using this kind of nonofficial statistical sources for cross-country analyses it is essential to proof carefully, how far the data from different countries are harmonized (cf below).

Data on Communications and Media Provided by Official Sources

Governments decide about the scope of a continuous data collection process surveying enterprises, local production sites, households, or other statistical units. These general statistical programs also confine the availability of data on communications and media from official sources. Sometimes new statistical programs improve it. One example is the establishment of a statistical program on audiovisual services and related sectors (AUVIS) by the European Community (EU, 1999a). Another example is a special statistical program on 'information society statistics' by collecting data on the usage of advanced IC technology in enterprises and households, which started because of a G7 summit initiative in the 1990s (ISPO, 2000). Two factors are crucial for decisions about the number and type of collected variables in a statistical program: the 'expressed user needs' for statistical information on the one hand and the 'statistical environment,' i.e., constraints given by internationally agreed classifications for economic statistics, on the other hand.

Statistical Programs and User Needs

A typical implementation process of a new statistical program, for example by EUROSTAT, starts with a consultation process, asking the EU administration (general directorates), NSI and all relevant industry associations organizing enterprises on a European level. This means that the expressed needs of regulators and organized market players will have priority to those needs which might exist in the scientific community or in the general public, for example, journalists who are interested in monitoring the communications and mass media system. In order to reduce the cost burden of data collection for responding enterprises the number of items is minimized, particularly in the case of surveys among small- and medium-sized enterprises.

The expressed data needs of industry associations are normally concentrated on market data and – to a lesser degree – on industry information. They are motivated by a general interest in higher market transparency, which will give members of the association cost-saving opportunities to compare the economic performance of the own enterprise with the industry average, or to analyze structural changes in demand patterns or general trends in market growth. The data needs expressed by the EU administration and by national regulators (via the NSIs) are more related to special regulatory goals pursued in the policy fields of telecommunications, mass media, or IC technology. Three different policies approach this demand:

- Industrial policy, which considers the information and telecommunications (IT) industries and the media industry (nowadays often as a part of 'the creative industries') as key sectors for economic growth with major employment opportunities.
- Competition policy, which aims to avoid monopolistic concentrations of market power in all sectors and their negative impacts on market performance.
- Cultural policy, which wants to avoid negative impacts of media concentration on the diversity and quality of national cultural production or on political pluralism in particular.

The establishment of the above-mentioned AUVIS program, for example, is closely related to an EU industrial policy program in the field of audiovisual services to strengthen the competitiveness of European producers against Hollywood (EU, 1999b). Cultural policy goals are less important. This is demonstrated by the fact that EU member states have to collect data about the country or origin of cinematographic films exhibited in all cinemas or of fictional programs shown on national TV channels, but no data about the genre structure of transmitted TV formats. (Among other actions, a 50% quota for TV programs with European origin was implemented.)

The Statistical Environment: Dominance of Industry Data Instead of Market Data

The general 'statistical environment' also influences the type of data collected by official sources on communications and media. On the one hand, statistical programs on economic indicators are dominated by the concept of national account statistics (System of National Accounts (SNA), established by the United Nations in the 1950s). On the other hand, official sources have to bear in mind internationally agreed statistical classifications of industries, goods, and services.

The SNA standardizes the calculation of growth rates and productivity development in industries or economic sectors (related to the three sector model of agriculture and mining, manufacturing industries, and services industries) across national economies. This means that the variable list for enterprise economic information (also called structural business statistics) is the same for all types of enterprises in all industries and that the opportunity to collect additional variables for communications or media industries is rather limited (EU, 1999a).

Data collection on production output and consumption of goods and services follows two different concepts: data on the supply side of markets is normally collected and aggregated by following the institutional approach, while data on the demand side of markets is collected by following the functional approach. These two approaches are also known as the 'industry approach' and the 'market approach':

- The institutional approach (industry approach) consists of aggregating variables describing the economic attributes of those enterprises, whose primary economic activity characterizes a particular industry within the national economy. Enterprises that produce the same products as a secondary activity are excluded. A TV channel that, for example, also produces its own TV guide belongs to the TV-broadcasting industry but not to the magazine-publishing industry.
- The functional approach (market approach) aggregates economic data by similar products, which characterize a particular economic market. Markets may be defined either from the consumer's point of view, which consists of all functional substitutes serving the consumer's needs (for example 'newspapers'), or by considering the economic or technical attributes of products (for example 'printed newspapers' or 'online newspapers'). Using technical attributes, the following taxonomies are used for telecommunications and Internet services and media products: by type of end users, by type of financial flows (e.g., advertising or direct payments), by type of content (e.g., audio or audio-visual), by degree of interactivity, by type of production technology, or by type of distribution technology.

Business surveys conducted by NSI follow the institutional approach and the data is primarily used to calculate indicators on production output defined in the SNA (e.g., gross value added, gross investment, gross capital formation, or total employment). Since households can be more easily surveyed about the kinds of products they have purchased than about their respective manufactures, economic statisticians follow the functional approach in surveys on household consumption.

The result is that the turnover of a specific industry, for example newspaper publishers, measured by the institutional approach, differs from market sales figures for newspapers, based on the functional approach. There are efforts to minimize this difference by defining goods and services markets generally by the economic origin criterion, i.e., to define products not by technical attributes but by the main economic activities of the enterprises of an industry (the so-called integrated system).

The Statistical Environment: International Nomenclatures and Classification Systems

The UNSD developed two statistical classifications that are obligatory for all economic information published by official statistical sources: The classification of economic activities (defining industries) and that for economic products (defining goods and services markets):

- ISIC Rev.4 (*International Standard Industrial Classification of all economic activities*) is the UN classification for economic activities, designed to categorize production data relating to economic 'statistical units,' like an individual plant or a group of plants constituting an enterprise. It structures the national economy into classes and subclasses of industries. NACE (*Nomenclature statistique des activités économiques dans la Communauté européenne*) Rev.2 is the corresponding classification for EU member states.
- CPC Ver.2 (*Central Product Classification*) is the UN classification for manufacturing and services products. Though closely linked to the ISIC nomenclature, the CPC consists more subclasses. CPA (*Statistical Classification of Products by Activity*) 2008 is the corresponding classification for EU member states.

Another UN classification exists for traded goods, called the *harmonized commodity description and coding system* (HS 2012). The *combined nomenclature* (CN) is the corresponding classification for EU member states. Both have far more subclasses than ISIC and CPC in order to address the special needs of custom offices. (The World Customs Organization originally introduced the HS classification in 1952.) Since some manufactured goods or services are not meant for household consumption, the UN has developed another *classification for individual consumption according to purpose* (COICOP). Its substructure of 14 main purposes is the reference point for all NSI publications on private consumption as well as for the calculation of consumer price indices. ISIC and COICOP are also used to structure production output and consumption data in national account statistics. Since 2008, the national account statistics of EU member states were adapted to the ISIC structure. This means that data on gross output, gross value added, employment, or labor productivity are continuously published for several industries producing 'information and communication services' forming together an 'information and communication sector.' In the North American Industry Classification System, such an 'information sector' was established more than 10 years earlier. Figure 1 illustrates the relationship between ISIC, CPC, HS, and COICOP.

Communications and Media in Official Statistics

Communications and media industries and products have subclasses in all classifications. However, the two main

Figure 1 UN and EU activity and product classifications for economic statistics. ISIC, International Standard Industrial Classification; CPC, Central Product Classification; HS, harmonized system; COICOP, classification for individual consumption according to purpose; CN, Combined nomenclature for foreign trade statistics.

economic classifications of official statistical sources ISIC and CPC are restricted to a maximum of subclasses. This means, that the degree of differentiation between communications and media industries and products is rather limited. Figure 2 shows the currently available data on industry output and household consumption of communications and media in SNA statistics.

Since the speed of innovation in ICT is very high, it constantly shifts the boundaries between media industries and creates new media markets. In light of this, data on 'new media' are in high demand from market players and governments. This demand conflicts with the regular revision period of economic classifications: the COICOP, HS, ISIC, and CPC are all revised on a 5-year schedule. This is a consequence of the close relationship between all classifications. If the structure of one classification is changed all others have to be changed accordingly. As a result, new communications and media industries or products (like new Internet services) are usually 'hidden' in official economic statistics for a couple of years, either in one of the 'old' activity or product classes or in the auxiliary category 'not else classified.'

Secondary analyses of cultural, political, or social dimensions of communications and media cannot rely on internationally concerted classifications in the same way. One important exception is indicators for the use of Internet services and IC technology in households and enterprises. Under the heading 'information society statistics,' OECD and ITU developed *Guidelines for statistics on the access to telecommunications infrastructure and for surveys on the use of households of IC technology* in a coordinated action. (International Telecommunications Union (ITU): Manual for Measuring ICT Access and Use by Household and Individuals, 2014 edition (www.itu.int).) Since 2004, EUROSTAT coordinates similar surveys on the use of IC technology by business enterprises in all EU member states, with an emphasis on small and medium scale companies. (EUROSTAT: ICT usage by enterprises. Reference metadata (http://epp.eurostat.ec.europa.eu).)

EUROSTAT has also made an effort to compile cross-national data on cultural activities from EU member states. (EUROSTAT: *Pocketbook on Cultural Statistics* (http://epp.eurostat.ec.europa.eu).) Due to different national traditions in surveying media markets and publicly funded cultural activities, the result is rather small. The *Pocketbook on Cultural Statistics*, published in 2011, contains only a few data on cinema, book, and printed press markets in EU member states.

Data on Communications and Media Provided by Nonofficial Sources

National and Supranational Nonofficial Sources

The bias for industry data instead of market data in official economic statistics, and the high innovation rate in IC technology drive a demand for more detailed statistical information particularly on 'new' communication and media markets. National industry associations often try to provide this missing data. Either they collect turnover and sales data from their member companies or they commission surveying companies to collect it.

In nearly all countries, specialized enterprises collect the following five types of information on communication and media as a commercial business:

- Data on individual communication and media enterprises compiled from balance sheets, profit and loss accounts, or

Communications and media activities (ISIC rev.4/NACE rev.2 - 2/3 digits)	
Manufacturing	**Section C**
Printing and reproduction of recorded media	18
Manufacture of computer, electronic, and optical products	26
Information and communications	**Section J**
Publishing of books, periodicals, and other publishing activities	**581**
Software publishing	**582**
Motion picture, video, and TV program activities	**591**
Sound recording and music publishing activities	**592**
Radio broadcasting	**601**
TV programming and broadcasting activities	**602**
Wired telecommunications activities	**611**
Wireless telecommunications activities	**612**
Satellite telecommunications activities	**613**
Other telecommunications activities	**619**
Computer programming, consultancy, and related activities	**620**
Data processing, hosting, and related activities; web portals	**631**
Other information service activities	**639**
Professional, scientific, and technical activities	**Section M**
Advertising	**731**
Market research and public opinion polling	732
Final consumption expenditure of households by purpose (COICOP - 3 digits)	
Communication	**08**
Postal services	08.1
Telephone and telefax equipment	**08.2**
Telephone and telefax services	**08.3**
Recreation and culture	**09**
Audio visual, photographic, and information processing equipment	**09.1**
Other major durables for recreation and culture	09.2
Other recreational items and equipment, gardens and pets	09.3
Recreational and cultural services	**09.4**
Newspapers, books, and stationery	**09.5**
Package holidays	09.6

Figure 2 Communications and media data on output and household consumption in System of National Accounts. ISIC, International Standard Industrial Classification.

other published materials about ownership structures. User demand primarily stems from financial investors seek to assess the competiveness and financial solidity of enterprises. Such data are also useful in researching and analyzing market concentration in telecommunications and media markets.

- Data on household consumption, particularly on new communications services or media products. Many of these surveys are regularly conducted on behalf of industry associations. Data collection is based on representative samples or panels of households or retailers.
- Data on the advertising strategies of companies across all sectors, including statistical information about total advertising expenditure on various mass media (newspaper, magazines, TV, radio, cinema, etc.). Enterprises wanting to monitor their competitors drive demand for data on advertising. In advertising research, these data are widely used to analyze industry-specific advertising behavior or the relationship between economic growth, the level of advertising spending (compared to GDP), and the financial base of mass media (cf Van der Wurff et al., 2008).
- Data on the audience for different 'publication units' like TV or radio channels or newspaper and magazine titles. Mass media companies commission this data collection as a precondition to get advertising money. It is primarily used for media planning decisions in advertising campaigns. In communication science data on total reach, frequency of use, and breakdown of users is taken to identify different patterns of media use in social groups of the society (cf Webster et al., 2006).
- Data on the structure of audiovisual media content. Copyright collecting societies drive the demand for information on the exploitation of audiovisual or audio copyrights by TV or radio channels. Such data can be used to analyze the genre structure of audiovisual mass media content to some extent (cf Buonanno, 2002).

Though some supranational industry associations publish cross-country data on special media markets on a regular basis, the range of data is often limited to a few key indicators. Examples are:

- The 'World Magazine Trend' annual report of the International Federation of the Periodical Press contains data on the number of consumer and business titles published, the number of copies sold, the average issue readership, as well as data on magazine advertising expenditure (www.fipp.com).
- The 'World Press Trend' annual report of the World Association of Newspapers contains statistical information on the number of newspaper titles published, circulation and reach of the newspapers, as well as data on newspaper advertising expenditure (www.wan-press.org).
- The 'World Advertising Trend' annual report of the World Advertising Research Center (WARC) contains statistical information on money spent for advertising in newspapers, magazines, TV and radio programs, cinemas, or for online advertising (www.warc.com).
- Annual reports on data processing and telecommunications markets in EU member states, the United States and Japan of the European Information Technology Observatory (EITO). The first edition in 1993 was a joint initiative of the EC Commission, the European IT industry association (Eurobit), and several European trade fairs. The EITO uses business enterprise surveys to collect its own primary data (www.eito.com).

Sources Providing Data on Internet-Based Communication

Data on the supply and usage of Internet services and Internet web content is collected by NSI or commercial data providers by using traditional surveying methods, e.g., for the ICT usage indicators published annually by ITU (cf above). However, Internet technology offers opportunities to produce process-generated data on Internet-based communication as well. Software tools, either server- or client-based, are increasingly used for web analytics. The starting point for this development was server-based log file analyses that gave Internet providers information about the search behavior of users on their own Web sites during one Internet session. These data can be used to optimize Web site content structure or promote advertising space (e.g., by counting page visits, click-through rates, etc.). Client-based software enlarged these opportunities. For example, tracking software places little programs (cookies) on Internet user devices to allow for the collection of user-specific data for more than one online session. These individual communication profiles can be used for a broad range of direct marketing activities. There are also tools for semantic content analyses to observe the diffusion and annotation of single news on the web, which show communication links between different Web sites. This type of analyses is frequently used to assess the efficiency of public relation campaigns. Furthermore, social network providers publish own social media metrics to measure the engagement level of users for websites by counting 'likes,' 'shares,' or 'comments.' Big data analyses aggregate and combine all the process-generated data on Internet-based communication for special regions or whole countries, and try to find significant correlations to special dimensions of social behavior, e.g., crime intensity or traffic flows (cf Mayer-Schönberger and Cukier, 2013). Social research on web communication is widely based on published metrics of web analytics tools, particularly of social network providers. However, it should be considered that the underlying software algorithm for most of these tools remains secret.

Methodological Limitations of Statistical Sources on Communications and Media

Data on communications and media provided by official statistical and nonofficial sources have some methodological limitations, which restrict suitability for social research.

Insufficient Data Availability for the Analyses of Cultural, Political, and Social Dimensions of Communications and Media in Official Sources
